UNITED CHARITIES BUILDING

EDWARD T. DEVINE, Director

ADMISSION to the one-year or two-year classes of the New York School of Philanthropy for 1914-15 will be by examination only.

Examinations will be held on June 29 and September 7. Registration continues from September 23 to September 29 inclusive. No registrations will be accepted after October 3. The entrance examination for the year now closing required specific answers to the following questions:

1. What is your idea of the meaning of "social work" and the business of the social worker?
2. State briefly what you understand by the following terms: Heredity, Juvenile Court, Capital (in the economic sense), Charity, Economic Interpretation of History, Defectives, Unearned Increment, Standard of Living, Probation, Death Rate, Environment, Instinct.
3. What kinds of facts (or statistics) are needed as a basis for social work?
4. Give a brief account of the industrial revolution, outlining social and economic problems to which it gave rise.
5. Describe some of the social problems that would arise through the location of a steel plant employing ten thousand men (about 50% of them unskilled labor) in the open country near a village.
6. What are the most important functions of the family as a social institution? What economic and social conditions are in danger of interfering with the continued performance of these functions?
7. What reforms in local government would further social welfare and why?
8. What social and economic conditions coming under your observation have impressed you with the need for social work, and what kind of social work do they seem to demand?
9. Of what practical use would a knowledge of psychology be in the treatment of a delinquent child?
10. How did you become interested in the School of Philanthropy? What do you expect to gain from attending it?

THE REGISTRAR, 116 S. Michigan Avenue, Chicago

The GIST of IT—

THE United States Supreme Court has upheld the constitutionality of the Massachusetts law of 1909 limiting the working hours of women and minors to 56 a week. In the meantime, the state has passed a 54-hour law. The constitutionality of the latter has not been attacked, so that the court's decision is less a practical matter than a re-enforcement of earlier decisions.

FRANK TANNENBAUM, leader of the unemployed in New York, has been found guilty of unlawful assemblage and sentenced to a year's imprisonment and a fine of \$500.

IT takes all sorts and conditions of men and women to make up "the poor," Mrs. Bacon found. Those who go down to live in the slums are smeared with the smut of them, and their children have not both slum environment and slum heredity. Page 30.

APPLICATION for a respite in the cases of the four gunmen convicted of killing Herman Rosenthal was made on Monday and Governor Glynn, while not announcing his decision immediately was declared to favor a reprieve until after the trial of Becker. Page 13.

AT the new Perkins Institution for the Blind there's not only sound teaching and good cheer, books in Braille and grand opera in raised notes, but a building plan that combines utility and beauty. Perkins' Gothic tower, some way, has struck into the lives of those who cannot see it, and squared their shoulders. Page 7.

WIDOWS to the fore again.

THE New York Legislature did not pass the pension or "allowance" bill. A preliminary report by the state commission holds that private charities have failed the widow. The private charities have come forward with a thorough diagnosis of their own condition based on a study of the work of six societies with 1,556 widows and their children, and a constructive program which puts public pensions last. Page 1.

DR. DEVINE'S report, on which their diagnosis is based, might be summarized thus: Most widows known to private charity are unskilled and must, if they work, take hard jobs at low wages, which was the lot of their husbands before them; few children are separated from competent mothers because of poverty alone, and those few could be kept together by closer cooperation between private societies and public officials; the work of the relief societies is good and is improving, but judged by actual rehabilitation of families it is far from perfect. Page 23.

THE dingy West Side, where Miss Anthony made her study, characteristically puts its mothers at work on their knees, scrubbing floors. They hold their jobs because six of them work for less than three men to operate a vacuum cleaner, and their helpless resentment of the machines classes them with the declining cabby who curses taxis. Page 17.

Play and Recreation for the Open Country

By HENRY S. CURTIS,

Founder of the Playground Association of America

800, 271 pages, illustrated, \$1.25

The young people of our rural sections need something more than instruction in the science of agriculture to make them efficient and contented. The evils of "all work and no play" exist in the country more often than in the city. This problem has been discussed and practical remedies suggested in "Play and Recreation for the Open Country." Almost every phase has been touched on in a helpful manner. The following are a few of the chapter titles:

Play in the Home
Play in the Dooryard of the Farm House
Some Experiences that Every Country Boy Should Have
Organized Play in the School Yard
Recreation for the Country Girl
Recreation for the Farmer's Wife
The Rural Church as a Social Center

We Believe—

THAT home-making should be regarded as a profession.

THAT right living should be the fourth "R" in education.

THAT health is the duty and business of the individual, illness of the physician.

THAT the spending of money is as important as the earning of the money.

THAT the upbringing of the children demands more study than the raising of chickens

THAT the home-maker should be as alert to make progress in her life work as the business or professional man.

—American School of Home Economics

NOTE—Send for 100-page handbook, "The Profession of Home-making," which gives details of home-study, domestic science courses, etc., it's FREE. Bulletins: "Freehand Cooking," 10cts.; "Food Values," 10cts.; "The Up-to-Date Home," 15 cts.

Address—A. S. H. E., 519 W. 69th St., Chicago, Ill.

THE SURVEY

COMMON WELFARE

SKIMMING POLITICS FROM MILK IN PROVIDENCE

"MILK IN PROVIDENCE is all politics."

This was the helpless feeling of many Providence citizens who were dissatisfied with the quality of the milk supply. But the birth of the Providence Housewives' League simultaneously with the rise in the price of milk from nine to ten cents a quart opened a campaign that lasted fifteen weary months.

With a desire to see if the increased price was legitimate, the investigating committee of the league turned to the city milk inspector for information. Immediately interest shifted from price to quality. The committee learned that people were not only charged an excessive rate, but were receiving poor and dirty milk from at least one large firm.

The milk inspector declared he was powerless to prevent adulteration on account of political influence, although further inquiry threw doubt on his word. On the other hand it was felt that no effective appeal could be made to the milk committee. One of them is reported by the league to have said on the street: "Why couldn't those d— women have come to us. We'd have fixed it up quietly."

The Housewives' League quietly had seventy-six samples of milk analyzed and found 50 per cent often below the state standard. Furthermore, they turned over to the city evidence that a ring of milkmen were paying graft each year for protection, and that watered and manipulated milk was being sold. These facts were published in the daily papers.

Then the storm broke and the milk committee was obliged to start an investigation in order to quiet the clamorous public.

Through forty-nine hearings, members and officers of the league were in constant attendance. They took the stand, refusing to be browbeaten by the milk-inspector's attorney. In the face of insult and insinuation, through legal quibbles and delay, they persisted in their demand for "Pure Milk for Providence."

The committee appointed by the city found enough evidence to recommend the dismissal of the milk inspector and his assistant, and to advise legislation raising the standard of milk in Rhode Island. An ordinance was introduced in the Common Council. It passed the council but was killed in the Board of Aldermen by the votes of four men. Two of these were members of the milk committee and all were said to be influenced by political motives.

This was a crushing blow but the women started the fight afresh.

The city asked the state to do what it had failed to do for itself. A bill was introduced in the General Assembly placing the milk department in charge of the superintendent of the Board of Health, thus automatically removing the present inspector. The women brought all manner of pressure to bear on the Legislature to secure the passage of the bill and declared their intention of showing, in case the bill didn't pass, why it had failed to do so. After a strenuous fight the bill was passed in February.

The victory for pure milk was the first battle of the Housewives' League. It has impressed merchants and manufacturers that there are formidable antagonists of dirty and adulterated food in Providence. The women have assisted in cleaning up city bakeries and in securing the correct labeling of eggs.

From the Providence Journal

NEEDY WIDOWS IN THE STATE OF NEW YORK

TWO REPORTS on needy widows in New York are fresh from the press.

One is a preliminary statement by the New York State Commission on Relief for Widowed Mothers, an official body appointed under authority of the last Legislature, of which former Assemblyman Aaron J. Levy is chairman. This was issued in support of the widows' allowance bill introduced in the Legislature by the commission, an outline of which was given in *THE SURVEY* last week. The bill did not pass.

The full report of the state commission, it is expected, will be issued in the course of a few weeks as a public document. A fuller analysis of it must await publication.

The other is the Report of an Investigation of Matters Relating to the Care, Treatment and Relief of Dependent Widows With Dependent Children in the city of New York, made by a voluntary committee.

The major part of the voluntary report, written by Edward T. Devine, is given on pages 23-29 of this issue of *THE SURVEY*, with a statement of the scope and purposes of the committee.

The voluntary report is rendered by an executive committee of ten members appointed by the chairman, Frank Tucker, from a committee of twenty-two including representatives of the large relief societies of Greater New York. It was an outgrowth of the discussion of governmental aid to dependent families at the 1911 meeting of the New York City Conference of Charities and Correction. Its appointment antedates that of the state commission and its investigation was contemporaneous with that of the latter.

The committee makes the following "findings and recommendations," based on Dr. Devine's report:

"1. The committee approves the suggestion that the fundamentally important aims in dealing with dependent widowhood and orphanage should be: (1) the prevention of such conditions by prolonging the lives and increasing the

A NEGRO SCRUBWOMAN

The New York State Commission on Relief for Widowed Mothers found "that most such mothers, doing wage-earning work of the crudest sort, bending over laundry tubs, for instance, or crawling with wash rags in their hands over the dirty floors of office buildings in the late evening or in the early dark morning, are unable to provide their children with the proper measure of the necessities of life." The commission's way out was a state pension.

The voluntary committee found that the occupations of widowed mothers "are mainly characterized by long hours, severe physical strain, and either low wages or exceeding irregularity and uncertainty of employment." The committee's way out is to prevent widowhood by prolonging the lives and increasing the working efficiency of men, to distribute the loss due to sickness and death of working men by a system of social insurance, and to furnish effective vocational training and guidance to children reaching working age. Pending the achievement of these ends, an adequate relief system.

working efficiency of men; (2) the distribution of loss due to sickness and death of working men by a system of social insurance; and (3) effective vocational training and guidance of children reaching working age.

"2. The committee recognizes the fact that pending the achievement of these results there must remain a large place for an adequate relief system and a wise relief policy in dealing with widows and their children. The need for relief will undoubtedly be diminished, but will not disappear when these other desirable results enumerated above shall have been secured.

"3. The committee is of the opinion that children should not be removed from the personal care of their mothers

for reasons of poverty alone; and that, when needed, adequate relief should be given to enable needy widows, qualified to train and care for children, to keep their children at home and to train and care for them.

"4. The number of instances in which at the present time children are being separated from their mothers, in violation of the principle stated above, is not as large as is commonly supposed. The Charities Department committed 5,767 children during the year 1912. Of these 861 were the children of widows. Of these 861 children our investigator reports that 190, in 100 different families, should clearly have been kept at home with their mothers, aid being given. Illness on the part of mothers or their

inability to control young children was recognized by our investigators as adequate reasons for commitment. In some cases such illness or inability to control may have resulted from absence of adequate relief. It is possible, therefore, that the number of children of widows unwisely committed in 1912 may have been somewhat larger than 190, but, in any case, it could not have been much larger.

"5. That 190 children, or a number somewhat larger than this, should have been separated from their mothers for poverty alone during 1912 is to be regretted. It indicates a lack of complete co-operation and effective action between the bureaus of dependent children and the societies giving or securing relief. The bureaus and the societies should immediately take steps to prevent the recurrence of this undesirable situation. Nevertheless it is our opinion that the relief of widows and their children in this city is more nearly adequately performed by the societies now engaged in this task than is any one of the important duties assumed by the municipality or the State in the care of dependent classes such as, for instance, the provision of sanatoria and hospitals for the tuberculous, or institutions for the feeble-minded; and is also more nearly adequate than is the relief for the poor from public funds in most of those localities in which public outdoor relief still exists.

"6. The number of children committed by reason of poverty alone is small in comparison with the number of children of widows already under the care of and receiving aid from relief societies. The proportionate increase in the work of these societies involved in preventing all commitments due to poverty alone would not be impossibly large.

"7. However, both in caring for the widows and their children now under their care and for those who would be brought under their care if all undesirable commitments were prevented, it is recognized that a larger number of well trained agents and also more adequate relief funds are needed.

"8. While a reasonable amount of work outside the home may be expected of a widow whose children are not of such numbers, ages, or conditions as to require her constant presence in the home, concerted effort should be made to see that she is not overworked as to number of days; nor allowed to perform labor demoralizing to health or character; nor underpaid because she is forced to accept whatever is offered in the way of employment.

"9. We are not able to state from the investigation made by us, even approximately, what increase would be needed in the resources of relief societies to enable them to prevent undesirable commitments and to care adequately both for those now under their care and for

those who are now being unwisely committed. We believe, however, that it would be possible to make a reasonably close approximation of the sums required.

"10. It seems to us desirable that the societies concerned should promptly make an inquiry as to the additional sums needed by them to enable them to aid adequately widows and their children needing aid in this city, and should endeavor promptly to secure assurance that such income will be forthcoming as needed.

"11. As to what course should be followed if the societies should be unable to secure the sum needed, the members of this committee are divided in opinion. Some, under those circumstances, would favor the establishment of a public relief system, believing that the possible evils under such a system would be less serious than those now existing. Others would oppose the establishment of a public relief system, believing that its evils would outweigh any possible advantages."

The report is signed by the chairman, Frank Tucker, vice-president Provident Loan Society; Cornelius N. Bliss, Jr., president Association for Improving the Condition of the Poor; Edward T. Devine, director New York School of Philanthropy; Lee K. Frankel, sixth vice-president Metropolitan Life Insurance Company, formerly manager United Hebrew Charities; Homer Folks, secretary State Charities Aid Association; Arthur M. Howe, editorial Staff Brooklyn Daily Eagle; Michael J. Scanlan, treasurer Superior Council of the Society of St. Vincent de Paul; Henry R. Seager, professor political economy Columbia University; Gaylord S. White, headworker Union Settlement; John A. Kingsbury, commissioner of public charities. Rabbi Stephen S. Wise did not sign.

The state commission reports that it has held more than one hundred hearings within the state, has observed on the ground the workings of widows' pension laws in five other states, has sent a representative abroad to study the social insurance and relief systems of Europe, has thoroughly questioned a large number of the officials of private charitable societies and has carefully examined their records.

This has disclosed "some 6,000 widowed mothers on the books of the private charity societies" in New York city, and in institutions throughout the state "more than 2,000 children who have been taken away from widowed mothers for no other cause than that those mothers, though physically strong and morally worthy, have been unable to support them any longer either by earning money of their own or by begging money from private charity societies."

The commission bases its recommendation of a widows' pension law on the

"fact, and" says the commission, "we emphasize that fact, that the private charities themselves are too poor to be able to rescue those widowed mothers, as a class, from poverty. Private charity, in this particular matter of the widowed mother, is today a failure."

The principle which the commission urges upon the Legislature, the report declares, is to remove needy widowed mothers from the category of paupers,

PITY THE POOR BILLBOARD

An eight years' battle for the regulation of billboards in St. Louis has just been won, although the companies are still fighting in the courts. In 1905 an ordinance limited the area of billboards to 500 square feet, their height to 14 feet and length to 50 feet. An injunction prevented enforcement until October last, when the companies abandoned an appeal to the United States Supreme Court from the decision of the Supreme Court of Missouri, which had upheld the right of the city to regulate.

The companies then sought to have the 1905 ordinance changed so as to legalize existing conditions. But the newspapers and civic organizations hammered away on the other side and the city council declined to make any change in the law.

The companies then applied to the federal courts for an injunction which has been denied. From this decision they are appealing to the United States Supreme Court. Meanwhile, the city officials are free to enforce the law and the work of reconstructing the boards is beginning.

following in the steps of Denmark. The report continues:

"The phrase is 'widows' pensions.' The phrase is wrong.

"A 'pension' commonly is for services already rendered. This 'pension' to a widowed mother is for services about to be rendered.

"A 'pension' commonly continues till death. This 'pension' to a widowed mother ceases when the reason for it ceases.

"It is a salary granted to her by the state in return for which she undertakes

to perform a certain present task of child-rearing.

"If she somehow becomes prosperous, the salary stops. If she neglects her task, if she neglects her children, the salary stops. When she completes her task, when the children are sixteen years of age, the salary stops.

"She becomes an employee of the state and, when the occasion for her hiring has gone by, she is discharged. In the meantime she has performed for the state the most valuable type of service that can be performed for it by anybody.

"In our bill, therefore, we have discarded the word 'pensions' and have used the word 'allowances.'"

The "one solid objection" to widows' pensions which the commission has been able to find—that social insurance would make such pensions unnecessary—"melts and vaporizes as soon as touched." Nevertheless, the commission makes two answers to the objection:

"(1) In the countries which have gone farthest into social insurance we still see the development of special measures of aid and protection for the children of widowed mothers.

"(2) Many years, perhaps many decades, will elapse before any system of universal compulsory insurance can be erected by the Legislature of New York. It is a thing of the distant future."

The report is signed by twelve of the fifteen members of the commission. Of the five members from the Assembly, Messrs. Levy, McCue, Burr and Rozan signed; Thomas K. Smith did not. Of the three from the Senate, Messrs. Pollock, Griffin and Thomas all signed. Of the seven appointed by the governor to represent the public, five signed, John D. Lindsay, Dr. William I. Sorovitch, William Hard, Sophie Irene Loeb and Mrs. William Einstein; two, Ansley Wilcox and E. Frank Brewster, did not sign.

Mr. Brewster is a business man of Rochester. Mr. Wilcox, who is president of the Buffalo Charity Organization Society, is opposed to the bill as introduced. He states that the preliminary report was not given to him in its final form for signature, and that he first saw it as presented to the Legislature after it had been printed. He says: "There are a number of statements made in this preliminary report which I do not know to be correct, and some which I do not believe to be correct, so that I could not possibly have signed such a report in haste or without more inquiry and investigation."

It will be remembered that public outdoor relief, of which widows' pensions or allowances are now generally acknowledged to be one form, is common throughout New York state with the exception of New York city including Brooklyn. The proposed widows' pension law was for the whole state.

GOOD HOUSING STANDARDS SET IN GRAND RAPIDS

THE LATEST CITY to adopt a thorough-going housing code is Grand Rapids, Mich. It deals with all classes of dwellings—single-family, two-family and multiple, with hotels, asylums, clubs and other structures in which people live. Its provisions for proper lighting, ventilation, sanitation and protection against fire follow those in Veiller's Model Housing Law. In some cases its standards are higher, as when it requires fireproof construction for all multiple dwellings of more than two stories or occupied by more than four families. In this it has seen the advantage Chicago secured when it raised—or lowered—the New York standard to three stories. Grand Rapids at present has but few multiple dwellings. Those that it may build in the future will provide not only for light and air and sanitation, but also for the safety of their occupants, little enough to require in a multiple dwelling which at best is but a makeshift as a home.

Housing conditions in Grand Rapids at present were shown to be unusually good by a housing survey made by Udetta D. Brown last winter. There are, however, groups of old converted houses which are overcrowded with recent immigrants; occasional cheap and flimsy tenements that fill their lots, leaving no space for light and air when the adjoining lots are built upon; an increasing number of alley dwellings; and a few "apartment" houses that appeal now because of their modern conveniences but which are sure to deteriorate rapidly if their number multiplies. It is the good fortune of Grand Rapids that the eyes of the people were opened before these conditions became widespread.

The report on the housing survey led to a demand for regulations that would prevent the growth of bad building habits and set good standards for the future. The survey had been made under the auspices of the housing committee of the Social Welfare Association. This committee joined forces with the building committee of the Common Council and the mayor appointed representatives of various civic and social organizations to serve with them as a semi-official housing council which held public hearings, secured the co-operation of city officials and of such bodies as the Association of Commerce, the Real Estate Board, and neighborhood improvement associations. Finally it presented to the council a code which was adopted.

The weakest provisions of this code are those dealing with rear yards, which need be only 20 per cent of the depth and area of interior lots, and only 10 per cent of corner lots. Minimums of 25 feet and 15 feet respectively might well have been required. The required percentages are understandable in a city

where nearly all lots at present are one hundred or more feet deep, but they invite trouble in the future when land becomes more crowded and lot subdivision begins.

On the whole, the code is excellent and will safeguard the city against evils that are comparatively easy to prevent but difficult to cure.

SELF-GOVERNING WELFARE LEAGUE OF PRISONERS

"I SOLEMNLY PROMISE that I will do all in my power to promote in every way the true welfare of the men confined in Auburn Prison; that I will cheerfully obey the rules and regulations of the duly constituted prison authorities, and that I will endeavor to promote friendly feeling, good conduct and fair dealing among both officers and men to the end that each man after serving the briefest possible term of imprisonment may go forth with renewed strength and courage to face the world again. All this I promise faithfully to endeavor; so help me God."

This oath was taken a few weeks ago by forty-nine men prisoners standing with uplifted hands in the chapel of the New York State Prison at Auburn. These men had been elected in secret ballot by 1,350 of their fellow inmates to constitute the board of delegates of the new "Mutual Welfare League."

This league, the formation of which has been the work of the prisoners aided by Thomas Mott Osborne, chairman of the state commission on prison reform, is an experiment in enabling prisoners to fit themselves for a more self-controlled life outside prison by giving them greater control of their life inside.

Only as the prisoners show that they can be trusted with power will the scope of the league be extended; but it has already demonstrated its usefulness to such an extent that the warden has given to its grievance committee the administration of the minor discipline of the prison. A similar league has been organized among the 117 women in the women's prison.

At present the executive committee has charge of the formation of clubs, conduct of lectures, entertainments and other activities. A delegate is elected for six months and may be recalled.

Any prisoner signing the rules and by-laws may become a member, but membership is forfeited if his behavior is not satisfactory to the league. These rules were adopted by the men themselves in open debate. The clause in the oath which calls for obedience to the authorities was not included in the original draft, but was inserted by the prisoners. The motto, "Do good, make good," was chosen by the men. Many of the delegates are old and serious offenders, but they are men whose personalities have impressed their fellow inmates.

SMASHING OF THE MORRISTOWN SURVEY EXHIBIT

WIDELY published newspaper reports have told how a group of Italians destroyed or mutilated a score or more of the charts and photographs in an exhibit of social survey findings at Morristown, N. J. The incident has raised sharp questions as to exhibit functions and methods and goes to show that a specialized technique must be used in popular social propaganda.

The newspaper dispatches indicated that the Italians who were angry because the exhibit reflected on their manner and place of living, descended on the hall in a body and smashed things forthwith. Italian prejudice was aroused by the misquoting of an incidental remark in a public address.

Beyond and behind this incident lie the issues which, for those who are giving or planning surveys and exhibits, are of more importance.

That Morristown with its environs is a satisfying place of residence is evidenced by its remarkable number of costly homes and beautiful estates. It has also an alert organization of business men, a "boosting" newspaper, and real estate men with typical real estate enterprise and viewpoint. There are also politics in Morristown, and a paternal "boss" of the large Italian colony.

Added to these forces for arousing a suspicious and alert "public pride," is the important fact that Morristown is a small city so that nearly everybody knows everybody else and photographs need not be labeled with names and addresses to secure quick identification. Moreover, pride in having the whole family photographed is easily dissipated by a neighbor's careless or insinuating remark. Then, too, in statistics for a city of this size (12,500) small errors or unqualified figures loom large in proportion to the totals.

These, doubtless, were factors in the objections raised by prominent critics outside the Italian colony. The Board of Health, for example, challenged the statement that Morristown's death rate is 50 per cent higher than New York city's and at their next meeting showed clearly enough that Morristown's two hospitals and the use of the city by invalid visitors increased its death rate. They held that deaths of non-residents should not be charged to Morristown's account, and they demonstrated that on a truer basis of comparison the death rates of the two cities are about the same.

Again, in the school report of the survey, it was stated that 12 per cent of all the children in the public schools were on part time and that of every entering class only one pupil in three graduates from the grammar school. The Board of Education showed in rebuttal that if "part time" had been accurately defined

it would have showed that very little time was actually lost; and that the percentage of graduates was based on a comparison of the eighth grade enrollment with the first grade enrollment of the same year, which was a marked increase over the first grade enrollment eight years ago when the present grammar pupils first entered school.

Most important of all, perhaps, in the Morristown lessons was the lack of an organized body of local public opinion to back up the findings, favorable or unfavorable. The survey was made by the Presbyterian Board of Home Missions at the instance of a small group of Morristown ministers. The material was collected, the exhibit was set up and the public was invited to see it and hear it interpreted without preparation beyond a preliminary advertising campaign which centered in a slogan of "What is the Matter with Morristown?"

Naturally enough, the public did not feel that this was *their* survey. When the facts were challenged the few who were in charge had to bear the brunt of the whole thing. Related to this was a lack of general understanding of the spirit and purpose of the survey which led to misinterpretations of it by both individuals and important groups.

The following comment on the situation is made by a man who has had wide experience collecting exhibit material for social uses and in "getting over" that material to whole communities:

"The Morristown incident does not mean that there should be any hesitancy about revealing local conditions. The very keynote of the social survey is publicity, but the publicity should be educational and constructive, which means that it shall be so handled that the least amount of irritation will be aroused and the greatest amount of responsiveness will be cultivated. The exhibit is probably the best single medium for presenting the survey findings in attractive and convincing fashion to the community.

"The exhibit in relation to a survey will not only report the findings but is expected also to facilitate community understanding and support of the same. Thus the exhibit of survey results should be more than a billboard statement of bare fact. A constructive program or suggested remedy should go with an account of a bad condition. Then again, a simple fact, however accurate and complete in itself, may be entirely without significance or even misleading unless its meaning or the qualifying facts are also stated. For instance, the public officials may not satisfactorily dispose of garbage, but the exhibit of a survey cannot ignore the fact that the city officials lack authority, or funds, or public support, or whatever it is which the surveyor may have discovered as the reason back of the deficiency."

In spite of the unexpected outcome in Morristown there is already assurance that even the undesired publicity will be

TIME EXPOSURES by HINE

THE DOUBLE STANDARD

The two youngsters at the mill gate assured Mr. Hine they were 12 years old. Twelve is the meager minimum working age fixed by Alabama law. "Pinky" was particularly sure of it and his mother bore him out. But the school record, disconcertingly enough, showed him barely eight.

Other school records, family Bibles and life insurance policies in Huntsville testified to five children of 8 and 10 years at work; to 13 who had started to work before they were 12.

The bigger boys in the panel work for the same company. But they are in its mill in New England where the minimum age is 14 and most of the children, Mr. Hine found, are 16 or over.

Both pictures are of employees (the diminutive form of *employee* has not yet been coined) of the Merrimack Manufacturing Company which has mills at Huntsville, Ala., and Lowell, Mass.

fruitful of results. It is impossible that garbage disposal should be a chief subject of conversation on Sunday evening at the exclusive club in the town without some helpful reaction.

New Jersey has furnished a similar incident the past month. The tuberculosis exhibit of the State Board of Health was roundly condemned by a woman in a small town who found her small rooms and her large family held up in a stereopticon picture as an example of how not to live.

Dr. Millard Knowlton, director of tuberculosis work for the board, writes THE SURVEY that this picture was taken in conformity with his practice of using local pictures in each community, that he secured permission to take the picture and that he used it to show crowded conditions. The mother and her eleven children were all in the one picture, beds for the eleven were packed tightly into one room, the parents sleeping in the room adjoining. The mother's objection, he has since learned, came from her misunderstanding of the point of the picture, which she believed was being made the basis of a plea for relief, which she resented. The family income is \$25 a week and Dr. Knowlton has been told that steps to improve conditions were taken immediately after the exhibition.

OLD AGE PENSIONS BROACHED IN CANADA

OLD AGE PENSIONS for Canada were shelved by "the government" in the Canadian House of Commons. While the measure was introduced by the opposition evidently to test the government's attitude and put it on record, yet the debate marks the beginning of the agitation.

In advocating an initiative of the pension system it was said: "We give assistance to railways and steamship companies, to the steel companies, and coal corporations, but the time had arrived when a step, even though a short step, might well be taken by Canada in the direction of old age pensions"; "while \$3,000,000 is paid out for housing the poor, an annual outlay of \$7,000,000 would suffice to pension the aged"; "the special commission of the House of Commons had presented evidence to prove that under present conditions it is impossible for the average workman in Canada to put anything aside for his old age."

In "adjourning the debate," the finance minister while disclaiming the idea that old age pensions would discourage thrift and admitting that the discussion had already passed "the academic stage," contended that it had not reached the legislative stage, because "there was no great body of pronounced sentiment calling for action."

THE SWING OF THE PENDULUM ON SEX HYGIENE

—BY WILLIAM F. SNOW, M. D.,

GENERAL SECRETARY, AMERICAN SOCIAL HYGIENE ASSOCIATION

Eight states make venereal disease a bar to marriage: Michigan (1899), Indiana (1905), Utah (1905), Washington (1909), and the following four in 1913: North Dakota, Oregon, Wisconsin and Pennsylvania.

Of these eight, Indiana and Pennsylvania name only "a transmissible disease"; the other six mention venereal disease specifically as a bar.

Indiana, Michigan, Utah, Washington and Pennsylvania do not require a medical certificate. The remaining three—North Dakota, Oregon and Wisconsin require a medical certificate.

ON MARCH 17 the Assembly of the New Jersey state Legislature passed the following bill, which now goes to the senate for consideration:

"The teaching of sex hygiene or sexology, and the distribution of any books or pamphlets in which such subjects are treated or discussed, in any school receiving any portion of the moneys appropriated for the support of public schools is hereby prohibited."

It was to be expected that the breaking down of the age-long silence of public opinion upon the social hygiene problems, would lead to some undesirable publicity and ill-considered efforts to promote unsound propaganda upon sex education and the white slave traffic. But social hygiene agencies were not prepared for the sudden swinging of the pendulum to the extreme of unguarded publicity which has recently been demonstrated by harmful books, plays, moving picture films, and lectures.

This New Jersey bill illustrates the inevitable reaction which is taking place. It is unfortunate that the pendulum has swung from the extreme of silence to this extreme of unlimited discussion without time for the development of a constructive program for action. It will, however, be still more unfortunate if the pendulum is allowed to swing back again to its old position of silence, enforced under certain conditions by law.

In obtaining accurate weighings in chemistry and physics, the scientist determines what he calls the "null point" by noting the extremes to which the indicator of the scales swings in a number of oscillations back and forth across the register. From this data he calculates the exact weight.

In a similar fashion the American Social Hygiene Association and other social agencies are trying to weigh the results of social hygiene efforts in various parts of the United States in order to determine the advisable educational methods to be adopted. Hasty or ill-

considered actions such as are indicated by the New Jersey bill as quoted above, or by the Wisconsin so-called "eugenics" marriage law, are calculated to retard real progress. The proposed New Jersey law would seem to be unnecessary and unwise. The Wisconsin law illustrates how a good principle can be rendered largely ineffective through incorporation in an impractical law.

Owing to the vicissitudes of legislation the Wisconsin bill became a law with several fatal defects and its constitutionality was challenged. A test case was brought in one of the lower courts, and the decision was against the law. The public impression has thus been gained that this was a decision of the Supreme Court and accordingly disposes of this type of legislation.

The facts are that the case has not yet gone to the State Supreme Court, and, in the meantime, is being operated under a decision of the attorney general, who has ruled that the legal interpretation of the phrase "recognized clinical and laboratory tests of scientific search" requires only those methods of examination which the average reputable physician in general practice understands and is equipped to apply.

It should be made clear to the public that this is not a type law, and that no one having a practical knowledge of the benefits a health certificate for marriage might accomplish, and a general understanding of the technical and expensive methods of laboratory diagnosis of venereal diseases, would endorse it as workable.

Physicians are required to sign a certificate which virtually requires a positive "yes" or "no" answer as to the existence of venereal infection in any form. This certificate reads as follows:

I, (name of physician), being a legally licensed physician, do certify that I have this day of , 19 , carefully and thoroughly examined (name of person), having applied the recognized clinical and laboratory tests of scientific search and find him to be free from all venereal diseases so nearly as can be determined.

(signature of physician).

A maximum fee of three dollars is specified for this certificate. When a "dispute or disagreement" arises regarding the findings of the physician, the state hygienic laboratory may be called upon to make laboratory examinations, but this assistance is not provided in ordinary cases. Indigent persons may apply to the county physicians.

Thus it is evident that technically only those who are adjudged too poor to pay three dollars, and those who have no confidence in the judgment of their physicians, are offered state aid. This

means in practice, of course, that the law undertakes to set the fee which shall be charged for a specified expensive and difficult examination, and then says to men desiring to marry, "You must find physicians willing to give you a certificate under these conditions or you cannot marry."

Aside from the absurdly low fee and the unwisdom of attempting to legislate upon fees at all, there is a very real objection to the law because the modern laboratory tests for venereal diseases are based upon a difficult and expensive technique, which few physicians understand or are equipped to apply. Consequently, if they are to fill out the certificate as specified, in good faith, and thus escape the penalty which would be enforced under a strict interpretation of the law, they must send their applicants to private laboratories at a minimum cost of probably fifteen to fifty dollars. The penalty referred to reads as follows:

"Any physician who shall knowingly and wilfully make any false statement in the certificate provided for in subsection 1 of this section shall be guilty of perjury and upon conviction shall be punished as for perjury, and a conviction under this subsection shall revoke the license of such physician to practice in this state."

The *Wisconsin Medical Journal*, commenting editorially upon the law, summed up the situation thus: "The medical profession has been and always will be ready to do whatever lies within its power to lessen the ravages of the venereal diseases, and the theory of the eugenic marriage bill might well receive our hearty endorsement, but in its present form the act asks impossibilities of the medical profession and the only loophole of escape is through insincerity and evasion. This is an intolerable situation, and the united profession should rise in protest. But as the state has seen fit to enact this law, let it, and not the overburdened medical profession, devise and provide ways and means of carrying it into effect." As the matter now stands if the law is construed by the Supreme Court strictly as written it is impractical for the reasons given above, if it is construed in accordance with the Attorney General's opinion it will fail to give the requisite protection.

Ten states during the past few years have passed legislation bearing on the principles represented by this law and the proposed New Jersey law. The intention of the author in one instance to safeguard marriage from the tragedies of preventable disease is excellent, but the law is impracticable. The intention of the author in the other instance to safeguard children and indirectly the public from unsound sex-education propaganda is also excellent, but the proposed law will not accomplish that purpose and may seriously retard desirable educational work in this field.

THE TOWER, FROM ACROSS THE CHARLES RIVER

COL. THOMAS H. PERKINS

Who gave his estate a century ago, for the education of the blind.

DR. SAMUEL G. HOWE

Inventor of the new system of teaching the blind.

MAIN TOWER AND GIRLS' CLOSE

Beauty for Blind Eyes

Indoors and Out at Perkins Institution

By E. H. Clement

PERKINS INSTITUTION is an "institution" indeed,—one of the boasts of Boston. It achieved world-wide fame nearly three generations ago, but the point of special interest to which this article is addressed is the feat that has been accomplished in transplanting the great institution. This octogenarian, with all its widespread growth, with all its deep-rooted associations of locality flourishing like an ancient oak, has been moved without maiming a single bough, without cutting a single rootlet.

The great sea-faring merchant-prince who had pushed Boston's commerce as far as China and the East Indies, and to the West Indies and South America, Thomas Handasyd Perkins, gave a century ago his home estate for the housing of the new education for the blind. Originally intended for all sorts of defectives, the method was then but newly invented by Samuel Gridley Howe, a singular young Boston doctor, freshly returned from participating in an ill-fated revolt of the Greeks inspired by Lord

Byron. It was not until middle-age that Dr. Howe became the husband of Julia Ward. Their honeymoon was a tour through Europe in which his triumph in the training of Laura Bridgman had made ready for him among all classes and in every land some such a reception as awaited Franklin after his demonstration that lightning is electricity.

Perkins' Early Fame

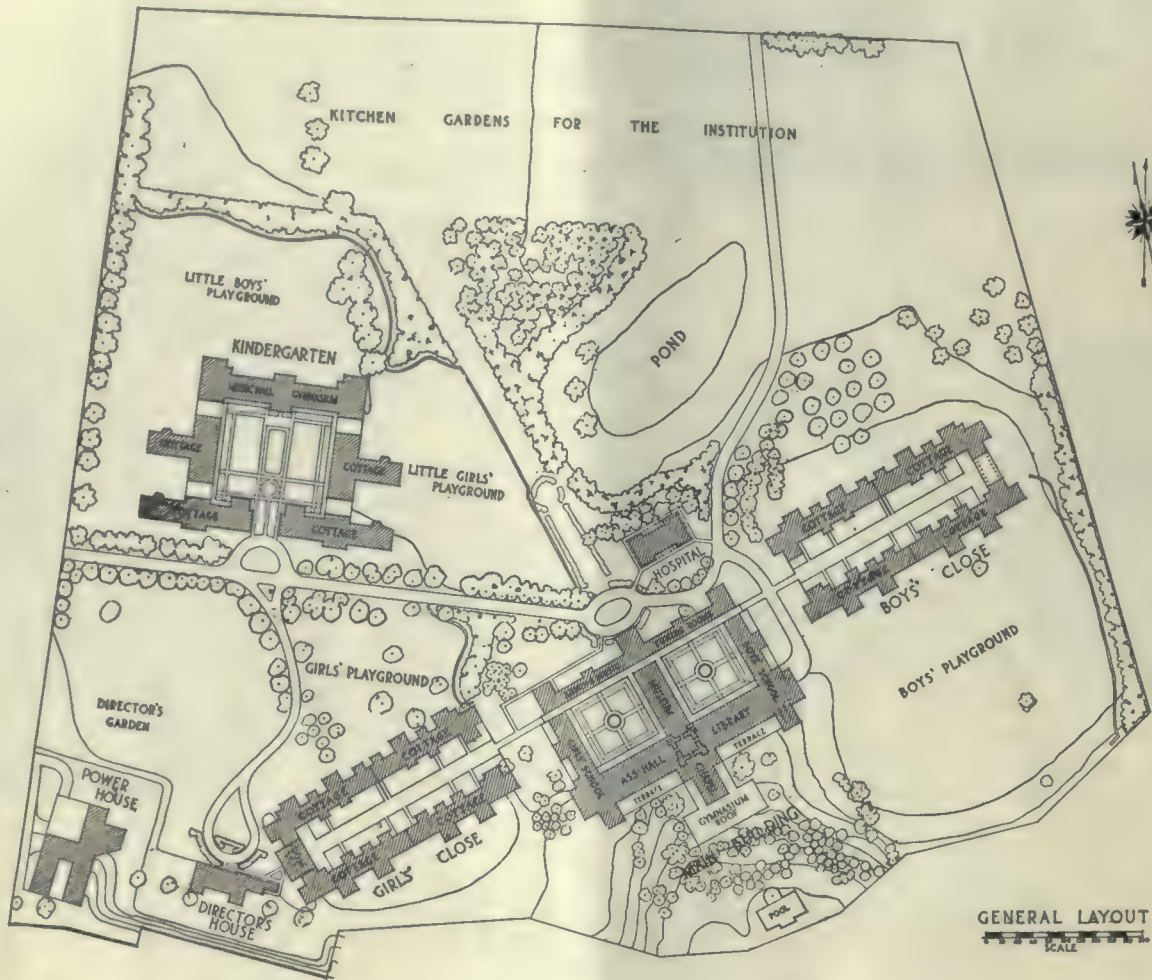

Thereafter, the Perkins Institution was the Mecca of all European tourists. Lafayette visited it. No less a pen than that of Charles Dickens gave it the best "write-up" the Institution has since received. Thackeray and Jenny Lind, Kossuth, Carl Schurz and his companions of the Revolution of '48,—any stripe of revolutionist found Dr. Howe a keen and active sympathizer. John Brown of Ossawatamie and a thousand other celebrities have joined the pro-

cessions winding down the stairs from the Institution's reception-room to the Howe family dining-room.

This much of history is necessary to an understanding of the difficulty and delicacy of the work of transferring the plant to a new site. Sentimental ties had to be ruptured, historical associations, personal memories sacrificed. The whole brilliant career of the Perkins Institution had been passed on this historic height where stood the battery that forced British authority to evacuate the rebel capital of New England. And the institution had had but two directors, Dr. Howe, and after him his son-in-law, Michael Anagnos, a Greek brought home from the campaign with Byron.

The whole institution, wherever and whatever it may be, is and must be Howe's monument. But there were some special interests of his, studies introduced, systems worked out, regulations and practices stressed as vital to the school, policies of administration and principles of pedagogy insisted on,

PERKINS INSTITUTION AND MASSACHUSETTS SCHOOL FOR THE BLIND.
R CLIPSTON STURGIS ARCHITECT 120 BOYLSTON STREET BOSTON MASS.

which may be said to have characterized his administration, and again others which characterized Mr. Anagnos' term as director. These have all been most loyally and piously safeguarded. Along with everything that was precious in the venerable Institution at South Boston, amid all the multifarious detail and enormous labor incident to the transfer to Watertown, busts and paintings representing Dr. Howe and Director Anagnos have been installed in their new places of honor. The lineaments of Mr. Anagnos, sculptured in terra cotta, or concrete, form part of the decoration of the kindergarten which he loved so devotedly and left so munificently endowed.

In contrast with the aesthetic evolution of Perkins in its superb new home, the old tinder-box ex-hotel in which it was housed in South Boston appears in memory like a homely, serviceable chrysalis for its splendid new birth and expansion. But there has been no break with the past in essentials,—neither in things pedagogical, nor in things spir-

itual. Even the vast, old-fashioned, revolving globe, in appearance the ancestor of all its kind, teaching geography through touch instead of sight, which stood in entrance hall-way so many years at South Boston, presents its burly form and offers genial welcome to faithfully returning corporation members as of yore. The teachers took weeks from their vacation, summer before last, to pack up cherished heirlooms among the furniture of the old home,—a touching testimony of the *esprit de corps* that pervades the hard-working teaching body, for whom "Service" is part of their compensation.

The New Perkins

And now the work is crowned with a new Perkins, a stately monument of all the "Service" that has gone into four score years and two. Dr. Howe began his work by gathering first a few feeble-minded children in his father's house in Boston because his interpretation of "noblesse oblige" did not admit of his taking money in medical practice.

The present director, Edward E. Allen, only the third in all these years, holds the high chivalric emprise of "Service" like his predecessors. He has achieved a million-dollar plant for his school of three hundred pupils and teachers. The outlay for plant in similar institutions runs, in this country, from \$1200 to \$2500 per capita. Allen has no misgivings over his per capita of \$3000. It means that Perkins is to live up to its old standing as the model establishment of its kind for the country and for the world.

In place of the dear old fire-trap barracks in Boston's east end, in cramped grounds closely begirt with slums, an extended series of buildings architecturally beautiful, grouped about a lofty Gothic tower with a chime of English bells, spreads for fully 1600 feet along a high plateau on the banks of the Charles River five miles from the city at Watertown. Its thirty-five acres were mostly the estate surrounding a mansion destroyed by fire a few years ago. The avenue of fine old trees which led up

MICHAEL ANAGNOS

The Greek who became second director of Perkins Institution

to it serves admirably for fitting approach to the new institution. About 20 acres are kept for playground space. A natural pond is another ornament for the grounds, and enters aptly into a basic scheme of the new education for the blind,—out-door sports and life for the pupils. The first total impression of low buildings and high tower, is somewhat like that across the Campagna, from the train, of a little old Italian city huddled around its campanile or its cathedral.

As you approach, you discover that the buildings are English, of the Tudor Gothic style. The group of college-like, low structures of brick, simply but artistically designed and finished, arranged to form quadrangles, cloisters and closes, may be "compared to the Vicars' Close at Wells in England," according to the technical description given by the architect, R. Clipston Sturgis, of Boston.

The Cottage System

But the choice of this building-plan was not determined only by aesthetic considerations, although such considerations have had large place in Mr. Allen's mind. "The matter of environment is a basic one in the education of the blind to which too much attention and study cannot be paid," he says. "The environment of both teacher and pupil, who are mutually dependent for results, must be stimulative. It must supply every known agency to encourage efficiency. The influence of such association for the enrichment of the intellect and the liberation of the spirit may be prodigious." At the same time, Mr. Allen keeps his feet solidly on the ground. The practical use and convenience and material advantages of his

plans for the new school went hand-in-hand with the aesthetic and spiritual outlook. He insisted upon the cottage principle in the housing of pupils, rather than a dormitory massing of inmates, by so much preventing the entrance into their life of germs of the "institution taint." Mr. Allen had already made a brilliant success of the rebuilding of the Pennsylvania School for the Blind and his fine plant at Overbrook, near Philadelphia, with its splendid upland site and great out-of-door spaces for athletics, and is novel and colorful architecture in Hispano-American Mission style, was the furthest advance, up to its date, of the new departure away from the type hitherto of such institutions. But in embodying the cottage system at the new Perkins at Watertown, he himself considers that he has made another step in advance and has left behind even the Pennsylvania school of his earlier pride.

The Closes

The cottages at Watertown, though as completely distinct as if they were detached houses, are in fact, for the sake of economy in space and in construction, built with continuous exterior walls, in groups of four cottages each. One group is for the boys and one for the girls of the upper school; and another group for the lower or kindergarten school. The last-named group differs in interior plan from the upper-school group, in that, on account of the tender age of its inmates, the school-rooms are under the same roof with the living and sleeping rooms. The cottages of the upper school form two "closes,"—an architectural as well as an ecclesiastical term—or quadrangles, with a broad street-like path down the middle of each close.

These open, bright, homelike closes, one for girls and one for boys,—purposely separated from one another by the whole distance and mass of the main building with the tower—are found in practice to be the favorite ground for the rendezvous of students after school-hours. With the whole beautiful tract as big as Boston Common, with old trees, and summer breezes from the river at their option, still the girls at least are apt to group themselves on their respective doorsteps to receive calls from the other cottages, or to walk up and down the wide concrete path bordered with nasturtiums.

You enter one of the eight cottages, either in the boys' wing, or in that of the girls, and you step into a living-room most generous in floor-space, with piano and lounges, easy-chairs and open fire-place, and flowers and tasteful draperies at the windows, all with much the air of a gentlemen's club, or the sitting-room of well-to-do college room-mates.

There is an equally spacious dining-room off the hall with three or four round tables, and certain of the pupils, chosen in turn, are waiting on the tables, as certain others in turn, will, when the meal is over, wash and dry and put away the dishes. Part of the training of the school is in this contributory house-keeping, just as another part of its influence is brought to bear in the cheer and elegance of the rooms and the habits of well-bred people at table.

Upstairs, in the bed-rooms and bath-rooms of these eight cottages, the appearance and scale of comfort and good taste are the same as downstairs. Every pupil must take the shower-bath every day. Students at Harvard and at Wellesley have the same sort of sleeping-rooms, and furniture, little knick-knacks on the bureaus, photographs on the walls,—all are quite the same. Though not seeing them, the pupils know they are there, and feel their influence. It was touching to see pennants and trophies of class games all bearing, besides specific numbers and initials, the head of a goat, signifying that they all go about butting into things!

The Library

To describe adequately the main building and its tower, and the history and significance of the libraries, where are kept Dr. Howe's raised-letter reprints of standard works on English literature and Mr. Anagnos's bibliographical collection; to tell of the object-teaching museum of birds and animals, and the historical relics, would alone take a whole paper. There are, besides, two beautiful halls. The smaller might be called the chapel, but is rather a choir, for rehearsing choral music which has taken the place of the former orchestral training. This hall is a perfect gem of design and finish. Its carved ornament

EDWARD A. ALLEN

Present director of Perkins Institution

KINDERGARTEN AND PRIMARY SCHOOL

on the edges and corners of the benches is one of the embellishments which the blind can feel as they find their way to their places. Adjoining in the same vestibule beneath the great tower, is the large hall for public assemblages. The platform is backed by the organ, and is also fitted up to be used as a stage for dramatic performances.

Into the basement of the central building runs a great tunnel which not only brings supplies to the cottages and workshops, and heat and power from the power-house down by the river, but affords a dry and warm and lighted passage-way for pupils in case of severe storms. In the basement, too, as the slope of the hillside gives light and air, are the gymnasium and the great swimming pool with every latest device, many peculiarly adapted to sightless bathers.

The Great Tower

All this is at the foot of the great monumental tower and is ventilated through its core.

It is a common thing to hear visitors remark, "What good does this do the blind if they do not see it?" The truth is that the blind have a very real sense of its presence and its effect, of its assertion of dignity in the Institution, of its influence on the spirits and self-respect of the teachers they depend on for their own cheerfulness, progress, and content. There is a literal physical connection in their consciousness too, of hearing the chimes from the tower. But there is a subtler and a more penetrating influence from the tower. It is easily conceivable that all concerned with the institution hold up their heads as being in their measure the functionaries of some noble edifice, some great public center. This sense of dignity and well-being cannot but react on their feelings and deepen their devotion, affect their habits and manners of thought

CARTOUCHE OF THE SEAL OF MASSACHUSETTS, ON THE WEST FRONT OF THE MAIN BUILDING

and speech. It is the majestic sign of all the spiritual influences which make over the pupils of the school from shy, depressed, often neurotic, sufferers into independent units of society, self-respecting because despite handicap, they are contributing their share to the world's work.

To one approaching this towered building, it seems alive with piano-tinkling: it is the piano-teaching, and the teaching of piano-tuning. Seventy-three pianos are the necessary equipment of the school. There is no sure livelihood for the blind boy or girl in learning an instrument of the orchestra. But there are remarkable records of blind pianists from this school, who have won triumphs in competition with the seeing, both in teaching and in tuning. The accomplished head teacher of music at Perkins now for many years, is a graduate with highest honors of the New England Conservatory of Music, E. J. Gardener. His work is primarily with the great chorus of the Institution, which performs annually the well-known oratorios and other of the best classical musical compositions; it has nothing to do with music of a lower order.

Pupils gifted with the sense of tune are taught from their entrance to read music by the raised points of the Braille system of musical notation. It is pathetically curious to see the ranks of the boys and girls standing in the stalls or benches of the beautiful choir-hall, all with their fingers on the line of dots they are to sing, and each part of the choir waiting till the forefinger following along the lines strikes the note at which tenors or altos, as the case may

IN THE MUSEUM, MAIN BUILDING

be, are to enter. The singing is done with evident enjoyment and intelligence, and the body of tone is singularly full and fresh. It is a significant fact, and one full of suggestion and psychological interest, that year after year, steadily as a law of nature, the girls who can take part in this sort of production of classical music outnumber the boys about two to one.

The Interior Beauty

This high taste and accomplishment in music has always given an atmosphere of refinement and cultivation to Perkins Institution. Now the latest administration has added that of a beautiful and dignified housing. An exquisite sense of something a little above the common-place, something of a touch of elegance within and without, in living-rooms and bed-rooms and even bath-rooms, as well as in the main building's noble halls and corridors, is everywhere in the vistas, in the air. It is even underfoot, in the red Spanish

TOTS "AT WORK" IN
THE KINDERGARTEN

the system is physical vitality and courage cultivated in out-of-door sports. After some years as assistant at old Perkins, opportunity came to translate his ideas into action in reconstructing the Pennsylvania school at Overbrook. There is no questioning the sound practical sagacity of one holding such a record of things done. Such a man does not necessarily exclude utilitarian and common sense considerations, when he fixes his mind on the ideal and philosophical and spiritual ends toward which humanitarian work aims.

We must therefore believe him speaking his conviction as an expert, as a man of life-long training and distinguished achievement, when he lays down such a principle as this: "Inheritance and environment are the two factors in life. Our pupils' inheritance we cannot change. It is often of the poorest; hence, the environment must be good enough to balance; in fact it can hardly be too good." One cannot question his deep and close personal sympathy with the objects of his care after reading this from his pen:

LIVING ROOM IN BROOKS
COTTAGE, GIRLS' CLOSE

tiling, decked with an ornamental center of blue and green tiles here and there, and at the crossing of the axes of the main building. The slight irregularity and unevenness of these tiles, as if here and there somewhat worn down by human feet, must make a direct appeal to the supersensitive touch of the blind, when even seeing people feel it. It is the type of the sort of loving thought and provision for these sensitive afflicted ones for whose benefit and encouragement the Institution exists.

Mr. Allen has proved himself sufficiently a practical and forceful man with this million-dollar plant to his credit, planned and nursed along by himself from the first selection of the site, which one day caught his eye from a railroad train on the opposite side of the Charles. He was an athletic trophy-winner in college and went directly from there to the Royal Normal College and Academy of Music for the Blind in London, founded by Dr. F. J. (now Sir Francis) Campbell, where the kernel of

DINING ROOM IN BROOKS COTTAGE, GIRLS' CLOSE

DINING-ROOM OF ELIOT COTTAGE, BOYS' CLOSE

"The tragedy of blindness is not the inability to see; it is the dread of dependence, of poverty and want and the pauper's grave. Childhood looks not so far ahead; but young blind men and women, however cheerful they may generally appear, too often yield to periods of depression. It is but natural the outlook should be dark and foreboding. The wonder is this is so often and so readily relieved. Blindness borrows trouble; its victims are overcome by self-pity. . . . I have seen the free courageous exuberant spirit of scholarship arise as the result of success on the playground and the athletic field. The work of successfully educating the blind has got to be founded upon the playground."

Just before Mr. Allen assumed his post, the board of trustees of the Perkins Institution sent him to Europe to study existing establishments of the same class. In Germany he found that we have much to learn from the Germans, but he also saw much that revolted his American soul. It hurt his feelings to see blind pupils left unkempt in personal appearance, in the coarsest, clumsiest cast-off clothes and prohibited from wearing linen collars. Hence he wrote:

"The American sees abroad survivals with which he is happily far less encumbered. He rejects the settled dictum that all the blind must be brought to the common level of the handicraft trade, and that practically all are bound to be always objects of charity, and hence must be treated as subjects of it while still school children—brought to an institution and reared there in an atmosphere of blindness, with not only no

probability of release, but rather the sure prospect of living and dying there. Where I found this thing it made me sad and resentful. Perhaps it was good business, but I could not reconcile myself to the inevitableness of it."

It is pleasant to contemplate a man with such breadth and depth of idea and faith and aspiration at the head of a great and growing institution, now completely covering its field and ready to meet the expansion of it as New England grows. He knows the detailed cost of every meal of the pupils per capita. He can tell you what the rushes cost for the bottoming of chairs, as well as how the majesty and dignity of the

DOUBLE ROOM IN THE BOYS' DEPARTMENT

Gothic tower that he watched building in concrete inch by inch, gets down into the consciousness of the sightless youths and maidens as a real presence and an uplifting influence. It is good to see, too, that his step is springy, his eye bright,—and that he carries no superfluous weight, his shoulders being as broad again as his waist-girth,—the build of a champion, in fact. His spirit is still that which produced at Overbrook what might have been called a sunburst on the future education of the blind.

"We, at Overbrook," he said at that time, "are charged with being optimists. We are optimists and most fortunately are we so. Were we otherwise our work would languish, and there would be little outcome. Our working theory does not attempt to minimize blindness, but rather regards it as a heavy affliction and handicap, the effects of which can be overcome only by bringing to bear every favorable means and influence that ingenuity can find or devise. The blind themselves must be strong and brave and fully alive to the difficulties of the task before them. Their leaders must be optimists with the resiliency of youth."

Thus is completed the chain of spiritual influences,—first the healthy body and the daring use of it, then the culture of the mind, and all the while the daily, hourly, constant, influence of the home-life of refinement, of education, good manners, kindness, mutual helpfulness.

In short, to sum up the spiritual influence of Perkins in the words of Director Allen:

"The principle which the Perkins Institution is now able to emphasize throughout is that the test of education lies less in what one knows than in how one can adjust oneself to society; that, while it is easy to instruct the young blind, it is difficult to train them so as to hold their own in the world. A reason for this difficulty lies in the tendency of the seeing to underrate the capabilities of the blind; another, in the natural proneness of the blind to magnify this 'prejudice of the seeing' and to minimize the influence of their own exertions in overcoming it. The Perkins Institution must be a living, working demonstration of the power of the young blind not only to do this but also to appear and act like other people,—really a continuous exhibition. To this end the best interdependent family living under reasonably ideal conditions is fundamental. . . . Perkins truly represents the best type of congregate-segregate institution for the blind that there is, and I have personally visited forty of these residential schools here in Europe."

The Four Gunmen

Is their part in the Rosenthal murder society's only interest in them?

By Winthrop D. Lane

UNLESS Governor Glynn intervenes, the four gunmen convicted of killing Herman Rosenthal, New York gambler and alleged "squealer," in July, 1912, will be electrocuted during the week of April 13. When the last of their bodies is lifted out of the chair, society will rest content in the belief that it has done its utmost to make their cases serve as deterrents from crime.

Yet the only thing about these youths in which society has shown any curiosity is whether or not they killed Herman Rosenthal. If they had been found innocent of that act, they would have been freed; since they were found guilty, they are to die. All investigation which did not ultimately shed light on the early morning scene when Rosenthal stood in front of the Hotel Metropole and was shot down without warning by unknown assailants, was of no interest or value to those who were carrying out society's desires.

Doubtless that was the first thing to be attended to. A murder had been committed in cold blood and until its perpetrators were in custody the state's attempts to protect its citizens would be a mockery. And when the details of the crime had been pieced together and it was found that four youths of responsible age had shown that they could be hired assassins, it became necessary to prevent them from repeating the offense.

But is it necessary to stop there? Is the gunmen's responsibility for the murder of Rosenthal the only thing of interest about them? Where did they come from? Who are their parents? How was their childhood spent? What schooling have they had? Did they become murderers in a day? If society is genuinely interested in deterrence from crime, ought it not to study the lives of criminals, as well as provide for their trial and punishment? How else can it know the processes by which they are made?

The following facts about "Gyp the Blood," "Lefty Louie," "Whitey Lewis," and "Dago Frank" do not make up complete biographies. Information about them is still guarded tenaciously by those who have it. The stories are presented now for the purpose of giving point to the question, Has society used the gunmen to its own fullest advantage?

To begin with Lefty Louie, who was twenty-one years old at the time of the Rosenthal murder. His father is a member of the New York Produce Ex-

change, and is financially well-to-do. Both parents were born in Austria, coming to this country before their marriage. The family, now living in the Bronx, is one of respectable, orthodox Jews. The father is trustee of a synagogue. Against Louis's four brothers, now grown to manhood, no suspicion of crime, so far as is recorded, has ever been lodged.

Louis was born at 17 Suffolk street, in the heart of New York's congested lower East Side. At that time his father kept a bakery and grocery at 13 Suffolk street and the family had to live carefully to make both ends meet. The father, with strict views on religion, was a stern disciplinarian.

"I do not know," he said to me after his son's conviction, "what you call bad. Some people say that if a boy doesn't steal or go with loose women, he isn't bad. But I call a boy bad if he isn't at table on time."

So, in the early years before they started to school, Louis and his brothers were never seen in the throngs of youngsters that played on the sidewalks and street near their home. Indoors they were given the customary moral and religious instruction of their race.

Lefty Louie's Childhood

But a crisis in Louis's life broke down the rules by which his father was seeking to protect him. At the age of six he became ill with the measles. The family physician, on the boy's recovery, insisted that he have all the fresh air he could get—an easy prescription to write, but not for a corner drug store to fill! There was no money with which to send Louis to the country where he could roll in grass and climb trees. His mother could not spare the time from her household duties and the care of the other children to supervise daily trips to nearby parks and open spaces. The best place for fresh air near home was in the street. So into the street, by edict of the doctor, Louis was pushed.

The world he found there was different from any he had known. The myriad sights, sounds and smells that he had experienced before only from windows, or on occasional trips out-of-doors with his parents, he could now investigate first-hand. New friends also were waiting to teach him the amusements of the door-step and the side-walk.

At about this time he began to attend the public school and a year or so later the Hebrew school. The former closed

at three o'clock in the afternoon and the latter, in which Louis studied the prayer book and the Pentateuch, at five. From then until seven or eight in the evening he was on the street, says his father.

A suggestion of the life he must have found there can be gathered from the following description of street amusements by the principal of one of the public schools in the very neighborhood where Louis lived. Her information comes direct from the seven and eight-year-old boys who make up the street population of the lower East Side today.

One of the earliest things they learn to do, she says, is to fleece the push-cart peddlers who line the curbs. It is quite simple. A companion grabs your hat and throws it into a cart piled with trinkets. You run up to the cart and in snatching your hat you close your hand around whatever is under it. The owner of the cart, if you have timed the exploit properly, is haggling with a buyer and does not notice you. Sometimes you get something which you can dispose of to an older boy for a few pennies or a nickel. Then you can go to the "movies."

From this game it is but a natural step to taking more valuable things from the small shopkeeper whose piled-up wares are brushed by the coats of the passers-by.

Soon you are sufficiently adept to become the useful tool of older heads. "Well, sonny, what play is on at Miner's this week?" you will be asked by a pleasant speaking man. "Like to see it? Come along and I'll show you how to make some easy money."

You receive your instructions and accompanied by the older man enter a small shop. While the man engages the proprietor or clerk in business conversation, you wander about unnoticed and at every favorable opportunity slip small articles of merchandise into a bag which the man has given you and which is hidden beneath your coat. When you are safely outside the older fellow takes the stolen goods and gives you a nickel or dime to go to the "show."

At ten or eleven years of age the pool-room begins to assert its attraction. There a boy is likely to meet practiced pick-pockets. He has only to listen to learn that there is a technique in extracting the contents of a lady's handbag. A particular kind can be boldly opened without danger; another kind is so hung that it must be cut, for to open it would be to cause a jerk that would surely be

felt by the wearer; and still another kind must be removed entirely and the contents taken out at leisure.

Louis's father says that by the time he was eight or nine years old he had become a "street fiend." Yet no complaints were received of his school work. When he reached the 3B grade and had to be transferred to another school because the one he had been attending had no facilities for boys beyond that stage, he was promoted, his father says, with a satisfactory record.

Meanwhile his religious instruction was being continued. After a year or two at the Hebrew school he was taken out and a tutor hired to come to the house. From then until Louis was thirteen private instruction in the religion of his race alternated with that of the school.

The first definite misdeed of which his family became aware happened when Louis was eleven or twelve years old. His father had lain down for a nap one afternoon when he heard some one rattle the small bank in which one of his sons kept his savings. Getting up he saw Louis and another boy going downstairs. The other boy, who the father knew was regarded in the neighborhood as "bad," was carrying the bank. The father called to them and Louis came back. He said that the other boy had suggested they take the bank. The father raised his hand to strike him, and Louis, who had appeared very much frightened, suddenly turned white and fainted.

This first piece of misconduct determined Louis's father to move away from the neighborhood in order to break up the associations his son was forming. A month or two later the family entered an apartment in Ninety-fifth street.

But for Louis, the "street fiend," this was only a change from lower "little Italy" to upper "little Italy," into the street life of which he soon plunged. It wasn't long, however, before his first associates asserted their influence and Louis was soon playing truant to slip back into the region where he had first tasted the excitement of street life.

A probation officer who has studied his record says that at twelve and thirteen years of age he was a frequenter of the pool-rooms near the corners of Clinton and Grand streets and Delancey and Grand streets, in his old neighborhood. There he was exposed to the instruction in pocket-picking already described.

At thirteen Louis was sent to a private boarding school outside of New York city. He had graduated, his father says, from the public schools, though the record of his graduation is not to be found. The private school proved distasteful and Louis was allowed to return to his home at the end of the first year.

For a while he held a job in the shipping department of an up-town depart-

"GYP THE BLOOD"

He and "Lefty Louie" were chums from childhood, and Lefty's story, barring the measles, is much like Gyp's.

ment store, but that failed to interest him and several months were spent in idleness. During this time, his father says, he showed the same old passionate desire to be upon the street. The only visible effect of his father's repeated remonstrance was to frighten him. His father is sure that at this time Louis was not engaged in law-breaking practices.

After a brief period of idleness Louis was employed in his father's office in the Produce Exchange. There he remained for nearly two years as an office attendant, errand boy, and in other capacities that called for little skill or training. His father will not say whether he knew at this time that Louis was leading a law-breaking life, but he could not have been long out of his father's employ when his first arrest occurred.

This happened in 1907, when Louis was sixteen. The charge was "disorderly conduct," and he was fined \$10 and sent to the House of Refuge. Whether a suspended sentence would have taught him the error of his ways, without adding the embittering touch of actual imprisonment, it is now too late to say. The opportunity to reclaim him then, if it existed, was not seized.

His term in the House of Refuge was short and in the same year he was again arrested, this time in Boston for larceny from the person. A sentence of one year in the House of Correction was imposed, but this was reduced to nine months.

"DAGO FRANK"

"The pity and conundrum of the four," says his attorney. Was it the reformatory that made him a criminal?

These were his arrests up to the murder of Rosenthal. From 1907 to 1912 he lived with his family in the Bronx, but followed no regular occupation and seldom worked. He occasionally served summonses for lawyers.

During the winter of 1911-12 he began to be unaccountably absent from home. In April, 1912, he married a girl about whom the detectives' terse comment was, "from accounts, a good woman." It was at this time that he ceased living with his parents. It is declared by the detectives that he and his wife occupied a flat with Whitey Lewis and Dago Frank.

"Either it is the street life of New York that made Louis bad," says his father, "or it is his own weak mind. I have had him examined by a specialist. Some time I may tell what that revealed."

From Poland to Chinatown

The early story of "Whitey Lewis" reads like that of many old-world families who throw themselves hopefully into the new-world melting pot. Both parents were born in Poland, coming to this country in 1900, when Whitey was twelve years old. Neither can now talk English in spite of their fourteen years' residence in America.

The family is Jewish, and both father and mother are members of a synagogue, though not strictly orthodox. For twenty years before their emigration the father had been foreman in a cigar factory. The

"LEFTY LOUIE"

Measles sent him at the age of six into the street for fresh air and he quickly became a "street fiend." Was he mentally defective?

loss of his position induced him to try his fortunes in this country. Having learned the book-binding trade in his youth, he entered on that occupation here and has continued at it ever since. The family is poor and two of Whitey's sisters work in a cigar factory to eke out the income.

In Poland Whitey never got into trouble, the family says. He was given the customary religious instruction there, but the parents' efforts to make a living in this country caused them to lose sight of this branch of their children's education. Whitey was entered in the public schools of the lower East Side, where the family took up residence on arrival and where they have lived ever since.

Apparently the excitement of street life in New York City offered temptations to twelve-year-old Whitey which were too strong for his rural upbringing to overcome. The police declare that during his first year here he became a frequenter of Chinatown, and made the acquaintance of professional crooks.

At fourteen, following his father's example, he entered a book-binding shop, but soon left it to learn tin-smithing with an uncle in Jersey City.

His first arrest was in 1904, when he was sixteen years old. The offense was attempted grand larceny in the second degree, and he pleaded guilty. He was sent to Elmira Reformatory, being received there December 3. Fourteen months later he was paroled in the care

"WHITEY LEWIS"

In Poland, where he lived till twelve, he never got into trouble. A year after his arrival in New York he knew the dens of Chinatown.

of the Prison Association of New York, and earned his absolute release in seven months.

"While here," says the assistant superintendent at Elmira, "his conduct was good. He worked at the book-binder's trade and made fair progress at it. His physical condition was fair, and his mental capacity poor."

In 1907 Whitey was again arrested this time for petit larceny. After a short term in the city reformatory he was convicted a third time. The offense was grand larceny in the second degree and he was sentenced to Sing Sing prison for four years. To these charges also he pleaded guilty.

All these commitments were known to his family, with whom he continued to live, when not in prison, until the year of Rosenthal's murder. He then began to divide his time between his family and a married brother. Neither his parents nor his brothers and sisters realized, they declare, that he was associating with professional "gangsters" or "gunmen."

When Whitey came out of Sing Sing he worked for four weeks for a glass manufacturer and then, at the suggestion of his family, entered the army. It was thought that in this way his associations with law-breakers might be broken up. He was sent to Fort William McKinley in the Philippines. But trouble followed him there, and in May, 1911, he was sentenced to hard labor for three

months and dishonorably discharged.

His own story of the affair is this: Being a Jew, he was constantly "picked on" by fellow recruits. His resentment went no further than words until one day, as he stood paring his nails with a knife, a fellow who had been especially obnoxious in taunting him, started in again. Whitey told him to "cut it out," whereupon the fellow got behind him and struck him in the back. Whitey swung around in self-defense and forgetting, he says, that he had a knife in his hand, accidentally cut his persecutor.

A different view of the affair was taken by the court which tried him, and he was found guilty of "feloniously stabbing a fellow recruit in the shoulder and breast with intent to do him bodily harm."

After this Whitey returned to New York and again fell in with his old associates. Like Lefty Louie and Gyp the Blood, he declared on the witness stand that he had met Jack Zelig, the notorious gang leader, about a year before the murder.

One of his brothers was sent to the House of Refuge in 1907, and another in 1908, the latter for picking a pocket.

The Conundrum of the Four

In the opinion of the attorney who defended the gunmen, Dago Frank is "the pity and the conundrum of the four."

Both his parents were born in Italy, as was Frank also. He was twenty-seven years old at the time of the Rosenthal murder. His father, who is said to have been a tailor, died years ago and his mother is a feeble old woman, whose almost constant presence at the trial of her son for murder excited much sympathy among court officials. In spite of over a dozen years' residence in this country she cannot speak English.

Frank was confirmed in the San Salvatore church (Protestant Episcopal), located at 359 Broome street, New York city, on May 22, 1901. He was then sixteen years old. The record of his confirmation is still in existence, and bears the signature of the bishop and archdeacon of the diocese. At that time the family lived across the street from the church. Frank's sisters were members of the Girls' Friendly Society of the church, and it is rumored that Frank sang in the choir. This is denied, the present rector says, by some of those who were connected with the church at that time. The family attended the church regularly.

Frank's earliest employment appears to have been with the New York News Bureau, for which he worked from 1900 to about 1904, or from the time he was fifteen to the time he was nineteen. From nine o'clock in the morning to three in the afternoon he carried printed sheets from the office of the bureau to brokers on the stock exchange. After three o'clock he helped in mailing the

Wall Street Summary, a journal published by the news bureau. He was usually through work by five o'clock. His duties required no skill and he was paid \$3.00 a week.

Frank's record with his employers during this period, it is declared by employees who knew him then, was entirely clear. No complaint was made against his character or habits of industry.

In December, 1905, Frank was convicted of carrying concealed weapons. This was the first offense charged against him, and it is the only one besides the murder of Rosenthal. His own story of this early arrest was that he was standing on the corner of Elizabeth and Bleeker streets when a man approached him and handed him a bundle, asking him to hold it for him for a few minutes. The fellow then went off and Frank discovered that he was holding a revolver and a sling shot. Fifteen minutes later he was arrested. He later learned, he said, that the man who had given him the weapons was a former prisoner.

He was found guilty and sent to Elmira Reformatory. At the end of fourteen months he was paroled in the care of the Prison Association of New York and seven months later received his absolute release. The assistant superintendent at Elmira says of him:

"His physical condition was fair; he had chromophytosis. He was considered of poor mental ability, had tuberculous glands, and other serious diseases. He was taught the plastering trade here, and his conduct was satisfactory."

Frank testified on the witness stand that after he was released from Elmira he worked for the Borgia Marble Company, but that a "touch of rheumatism" induced him to give up that job. He then worked, he said, for the Johnston Heating Company. The records of this concern show that from October, 1907, to October, 1908, he was employed by it as a steamfitter's helper, and that he was assigned to various construction jobs around the country. He was not a skilled mechanic. Employees of the company declare now that Frank's employment by it was unmarked by trouble of any sort.

Frank testified that he had subsequently been employed by several other engineering and construction companies. How steadily he worked and what he did with his spare time are questions which his family cannot answer. Neither does it seem possible to learn by what degrees he finally became a permanent acquisition to the gang led by Jack Zelig, to which his three associates in the murder of Rosenthal also belonged. His attorney is sure that Frank had led a straightforward life until his sentence to Elmira and that it was the associations which he formed there that developed his taste for "gang" comrades outside.

Frank was one of the few non-Jews who belonged to Zelig's gang. A Jew had once befriended his mother and sister, giving them employment and helping them meet their rent, and ever since Frank had had a kindly feeling for Jews. When Zelig was killed a letter from Frank was found on his body, reciting these facts and saying: "Although I'm a wop, I know you'll stick by me."

Gyp, the Pal of Lefty

One of "Lefty Louie's" early Suffolk street friends in the lower East Side was a lad named Harry, now famous as "Gyp the Blood." Gyp and Lefty have been close friends ever since. The story of Gyp's entrance into law-breaking is almost identical with Lefty's.

Both Gyp's parents, who are Hebrews, were born in New York. There is no record of law-breaking against the father, who for twenty-five years has been in the tailoring business in New York city, and makes a comfortable living for his family. Gyp was born in April, 1888, at 419 Third avenue. His father at that time kept a tailoring establishment at the corner of Third avenue and Thirty-fourth street.

At six or seven Gyp began to attend the public schools. At eight he was placed in the hands of a private Jewish tutor, with whom he studied the Talmud and the Old Testament. This instruction continued until he was thirteen. His father, like "Lefty Louie's," has an official connection with a synagogue and undertook to provide his son with the customary religious instruction of Jews.

At what time Gyp first entered upon the street life of the lower East Side cannot be told accurately. His father says that he was required to be in the house by seven o'clock every evening, and was not allowed to "run wild on the streets." He thinks Gyp's downfall was due to the evil associations formed during his first term in a penal institution.

When Gyp was twelve years old, his prospering parents joined the migration uptown, a year or two before Louis's family moved away from Suffolk street. A year or two later he worked as errand boy for a dry goods establishment in One Hundred and Twenty-fifth street, and it may be that his trips to all parts of the city in that capacity first acquainted him with the pool rooms of Delancey, Grand and Clinton streets. Certain it is that he and Lefty were at this time frequenters of those places and were rapidly being shaped by the associations which they found there.

In 1905, when Gyp was seventeen years old, he was arrested for the first time. The charge was petit larceny, but he was discharged. The next year he was arrested for a similar offense and sentenced to nine months in the city reformatory. A second term in the city reformatory was followed by a year in the state penitentiary in 1909.

Two of Gyp's younger brothers have been convicted of law-breaking. One was suspended from a public school in 1908 for "very bad" conduct. He then entered a private school. In 1912 he was sentenced to Elmira. The other was arrested for the first time during the month of the Rosenthal murder.

Such are, in part, the histories of the gunmen who killed Rosenthal. They are the histories of four young men whom the world has stamped as "hardened criminals," but beyond whose connection with a single crime the world has not cared to look.

A number of facts stand out. First, there is no record of law-breaking against the parents of any of them. Brothers of Gyp and Whitey have been convicted of offenses, but their waywardness came later, so that no one of the four can be explained on the ground that he came from a long line of criminals, or that family example and encouragement is responsible for his undoing.

The early years of each seem quite clearly to have been normal and straightforward, giving no hint of the direction later conduct was to take. One by one, through disease, going to school, or going to work, they came into contact with the abnormal street life of a crowded and heterogeneous community. Their youth demanded play and excitement and they sought these where they were easiest to find.

Gradually but with seeming inevitableness they made the acquaintance of older boys and men who had mastered the trick of turning an easy dollar. No power is as strong as that of suggestion and glittering example, and the swaggering ways and affluence of these people made heroes of them.

Their own entrances into crime were gradual, beginning, in every case but that of Dago Frank, with petty attempts while they were still in their teens to get spending money easily. Yet no attempt was made to give them the benefit of a sympathetic understanding. Whatever help there may be in probation and suspended sentence was not extended to them.

This is not a plea for leniency toward murderers. It is the mere putting of a question. No people is without its machinery of punishment. Is it not important also to know why those punished come to such a pass? Must the obtaining of that knowledge be left to the random explorations of an occasional journalist?

A deeper question is involved also. Has the philosophy of deterring crime anything to do with the causes of crime, or is it enough to go on removing the finished criminal? Shall we attack the processes of making law-breakers, or shall we be content to endow the electric chair with immortality?

FIFTY-FIVE YEARS OLD; FORTY-FIVE YEARS A WORKER; THIRTY-FIVE YEARS A WAGE-EARNING MOTHER

Mothers Who Must Earn¹

A Study in New York's West Side

By Katharine Anthony

SEGREGATED from the greater houses and the grander streets of New York city, the Middle West Side lives its own life in its own way, working when it must and snatching its pleasures where it may. Old houses, poor and costly transportation facilities, and human inertia combine to produce an isolated overgrown village. Its numerous rear tenements give it the stamp of neglect and sordidness. Living in these little rear houses

are the most conspicuously underpaid workers of the community,—irregular earners of both sexes bringing in just enough to keep soul and body together.

The neighborhood seems like the great neglected backyard of the rest of the

city. Much of the cast-off clothing and refuse food from better streets find their way thither. At the Salvation Army headquarters half-worn garments can be bought for nominal prices,—an overcoat for 25 cents, a pair of shoes for 10 cents. Under the Ninth avenue elevated on Saturday night the push-carts of "Paddy's Market" display great heaps of vegetables, fruits, and other wares rejected from better quarters. Everywhere there are "seconds"—oranges that have been frozen, nicked dishes, faulty shoes and garments—to be bought for next to nothing. During the day, the peddler carts similar wares up and down through the streets, filling the neighbor-

This article is made up of extracts from one of a series of studies which embody the results of an investigation into social and economic conditions in a Middle West Side district of New York, carried on under the direction of the Bureau of Social Research of the New York School of Philanthropy. Pauline Goldmark was in active charge of the investigation. Miss Anthony's complete study is about to be published in book form by the Russell Sage Foundation. Ed.

¹Anthony, Katharine: *Mothers Who Must Earn*. (West Side Studies.) 12 mo. Illus. 240 pages. Russell Sage Foundation Publication. New York, Survey Associates, Inc., 1914. In press.

hood with his hoarse cry and selling his load for what he can get.

In the poorest quarters are families that live almost on waste. The children forage for wood, coal, and ice along the railroad tracks and among the warehouses, and the mother brings home from work gifts of clothing and fragments of food. It is surprising how large a part of the minimum necessary to support life on the West Side can be picked up from the streets by boys and girls whose hunting instincts have been sharpened by necessity.

The basis of population is German and Irish and the social order reflects the racial characteristics of both. To the Irish comes an admixture of English and Scotch. Each group preserves to some extent its native habits and morals, the more serious German dwelling side by side with the easy-going Irishman. The characters of Gerhardt Hauptmann's sociological dramas live under the same roof with those of John Galsworthy. Teamster Henschel, with his dark rebellion, and Timson, the cab driver and drunken philosopher, meet as neighbors on the common stairs.

The lives of the families whose circumstances are reviewed in this study are peculiarly bound up with their environment. One can fancy some Jacques of the West Side reviewing the seven ages of man as they are lived by thousands around him. The infant, born and nursed in a dark tenement room; then the school boy spending a few years in some numbered "P. S." to learn for a brief season from some nameless "Teacher"; the adolescent making love on the Tenth avenue corner; the young adventurer risking his life in a gang fight or in a game of street baseball; the workingman with a growing family, who takes a drink to forget his troubles; the derelict, old at forty, finding it hard now to get a job; and then the grandfather, house-bound, minding his daughter's baby while she goes out to do a day's work,—such are perhaps the scenes in which he might shadow forth the "strange, eventful history" of the citizen of the West Side.

Not all members of the family are thrown back alike on the resources of their immediate environment. The father has glimpses of the world, even if only from the driving seat of his truck. The son or daughter may go to work downtown, and though it costs ten cents a day in carfare, the young worker has also a daily glimpse of something beyond the West Side. It is the mother of the family who least often sees beyond the neighborhood limits. Even the mothers who work away from home seldom journey far to a job. They cannot afford to spend the time in traveling back and forth, and they cannot afford to pay carfare out of their wages.

The effect of this is seen in the kind of work that they do. Unskilled, pre-

carious employment is the only thing within reach. This is especially true since the textile industry, once the resource of women of this neighborhood, has moved away. At present most middle aged women who work are employed as scrubwomen and cleaners in the theaters and office buildings on the outskirts of the district. The work of public cleaning draws its recruits principally from the class represented by the women of this study,—the mothers who must earn. Such work is largely drudgery. It belongs to the class of servile rather than of specialized labor. They have no skill to market, only untrained physical powers to sell.

The appearance of charwomen on their knees scrubbing an office floor, a public corridor, or the lobby of a theater is not one which inspires respect in the ordinary passer-by. The work of public cleaning bears, in addition to the ancient stigma attached to menial work, the ignominy of being done in public places. The dishevelled working clothes and the humble posture of the scrubbers seem to deprive them of any measure of human dignity. Some employers are inclined to feel that the kindest attitude toward these workers is to neglect and ignore them.

The irony of such considerateness is apparent when one remembers that their work was done in public corridors almost as exposed as a city thoroughfare. They are one of the most familiar sights of the business district.

BUT familiar as they are, the dingy toilers do not readily strike the attention. One may pass them again and again without stopping to think that a human life, more or less complete, is imprisoned within each of these humble figures. Least of all does one suspect what a life of heroic effort it may be, or how many of the workers, single-handed, are daily fighting a battle that takes more courage than Waterloo.

A more helpless figure than the middle-aged mother of a family starting out to look for work would be hard to imagine. Sometimes she buys a newspaper and reads the advertisements. Through the woman's exchanges, neighborhood churches, settlements, day nurseries, and charitable agencies, she may find opportunities to go out and work by the day.

But the women who do day's work derive at best a varying and uncertain income. They complain that "you never know what you'll have on a Saturday night." Those who must have "something regular" look for a factory job or an office cleaner's place. Like their sixteen-year-old daughters, their usual plan is simply to "apply on the premises." They walk about for hours, following up poor chances and, worst of all, wearing out their shoes.

With Mrs. Williamson the search became a desperate one as the months went

by. At her husband's death she had been left with two children, a boy of three years and a girl of eleven months. Williamson, who had been second officer on a ship, had left no insurance, but there were considerable savings in the bank. Consequently his wife had funds on hand to tide the family over a year and a half during which, of course, the children were growing older and less helpless. But the end of the savings inevitably came.

Mrs. Williamson began to look for work at the beginning of summer. A few odd days' cleaning and a little sewing were all that she managed to pick up. When November came she was still looking for work. Her story of how she finally got a job shows what a desperate frame of mind she was in by this time.

"There was a woman in the next house that worked at the hospital. One night she came by and said they wanted another regular cleaning woman. The next morning, as I walked up to the hospital, I kept saying to myself, if I didn't get that job I would go home and do away with my children. I don't know what might have happened if they hadn't put me to work that morning. But they gave me the job. I'm working there four months now."

The job which probably saved the lives of the Williamson children was scrubbing stairs and floors nine hours a day, six days in the week, and it pays the grateful woman who does it \$6.50 a week.

In the majority of public buildings the scrubbing is done in the most primitive fashion, for as long as the women's labor is as cheap as it is, there is little incentive for employers to adopt improved methods of work. There is also a general belief that women do this sort of work more thoroughly than men,—a fact which has served to prolong their tenure. Moreover, the scrubbing machines which have been tried so far have not been satisfactory. The superintendent of one building experimented with one in the large ground floor thoroughfare, but gave it up and returned to primitive hand-and-knee scrubbers.

It was difficult to get the superintendent to speak calmly of this scrubbing machine, or to refer to the experiment at all further than to declare he would never repeat it. However, he consented to make the following charges against it: "It took three men to run it,—one to operate it, one to carry water, and one to wipe up after it. It didn't clean the floors and it didn't touch the corners."

Most of the theaters have installed vacuum cleaners operated by male porters; but as yet they are not seriously depended on, and their daily use is said to wear out the carpets. The charwomen instinctively recognize in the vacuum cleaner a natural enemy, and none of them can be induced to say a word in its praise. They realize that as hand

A VICTIM OF THE LONG DAY

A GERMAN MOTHER AND HER YOUNGEST

cleaning in public buildings is replaced by machine cleaning their jobs will disappear.

The women suffer excessively from "cricks" in the back and neck, due to the long continued strain of stooping and kneeling. But they are not allowed to use long handled mops. The reason usually given is that it is not possible to clean so thoroughly with mops. However, it was observed in a certain hospital where most of the floors are done by women on their knees, that a few rooms, including the antiseptic operating room, were considered sufficiently clean after a porter had gone over the floors carefully with a long handled mop.

A serious feature connected with public cleaning is the thirst caused by breathing in dust. In one well-conducted theater, the eighteen scrubwomen had a cup of tea together at 10 o'clock in the morning. The manager was alive to the fact that sweeping is a dusty and fatiguing occupation, causing excessive thirst and creating one of the primary conditions for the beer-drinking habit.

The dangers to health from constantly breathing the germ-laden dust of great assemblage places need scarcely be mentioned. The public cleaning woman is the first and chief victim of the disgusting habit of spitting. Decent women were compelled to scrub floors unspeakably defiled by spitting, a condition as

dangerous as it was revolting. One woman was said to have acquired tuberculosis in her finger from scrubbing the floor of an orchestra. It is true that not all cleaning jobs were equally bad, but the worst involved hardships which were an offense against humanity and bore no relation to the numbers of women engaged.

But the ability to make the best of conditions which we can't remedy belongs to these women as well as to others more fortunate than they. Hear Mrs. Clinton, as she walks to the theater at 5 o'clock on a snowy winter afternoon. "I think I'm going to be able to keep this job," she says, "because six women have tried it before me and all of them gave it up. But I'm a steady worker, and that's what people want in New York."

AGAINST the somber background of West Side conditions, the special group of 370 women forming the basis of this study stand out in distinct relief. It is not only because we have focused attention on the simple realities of their lives that these women seem better than their environment would lead us to expect. The fact that the women were working qualified them at once for respect. They had had the enterprise to find work and the industry to keep it. They had not "put their children away" but were

making every effort to keep up a home. Their determination to shoulder their obligations and meet the responsibilities was nothing short of heroic. To a large extent, they represent the best standards and the best elements of West Side life.

The reason why these mothers were at work is to be sought primarily in the condition of the principal breadwinner. According to whether the father is dead or absent, whether he is living at home, and is unemployed or at work, the economic circumstances of the family may be roughly determined. The 370 women studied are here divided into six groups,—those whose husbands were withdrawn from the family through death, desertion, or separation forming three of them, and those whose husbands were living at home in a state of incapacitation, idleness, or employment forming the remaining three. The following table shows the number and percentage of mothers in each group:

CONJUGAL CONDITION OF 370 WAGE-EARNING MOTHERS		
Conjugal condition	Number	Per cent
Widows	125	33.8
Deserted wives.....	40	10.8
Separated wives.....	9	2.4
Wives with incapacitated husbands	21	5.7
Wives with idle husbands.	12	3.2
Wives with husbands at work	163	44.1
Total.....	370	100.0

MRS. LORINSKY AND HER FIVE REASONS FOR WORKING

It must be noted that the distribution of women according to family status, shown by the foregoing table, is not representative of family conditions in the district. Naturally, the proportion of widows, deserted wives, and separated wives would be much higher among wage-earning women than in the general population of the locality. It must be noted also that "incapacitated" in the above table means invalidity through specific disease and not old age alone. Husbands were counted "idle" only when they had been out of work for at least a year. Among those "at work," many intermittent or irregular workers were therefore included.

Briefly, the conditions within the family for our 370 mothers were as follows: The largest group of families was that in which the fathers were living at home and were "at work." The next largest was the group of widows' families. Of the latter, more than one-third, as further study showed, had been deprived of the breadwinner by tuberculosis—the disease which, most of all, exhausts the economic resources of the survivors.

Tuberculosis, pneumonia, work-accidents, and industrial disease were responsible for fully 60 per cent of the total number of dead or disabled wage-earners.

Of the living husbands, more than 60 per cent were under forty-five and should still have been earning regularly. An examination of their occupations, however, showed that they were engaged in low-paid work and that more than half of them were in occupations where unemployment is characteristic. Less than half the families had children who had reached working years. As to nationality, the families were principally

Americans and Americanized German and Irish, with homogeneous social ideals. All these circumstances emphasize the fact that the primary reason why the women worked was not moral or racial, but economic. They were the wives and widows of under-employed and under-paid men and were compelled to contribute to the family whatever earning value their labor possessed.

A very small number of the living husbands had been at work regularly during the year. Some had been out of work a month, some two months, some four months—not sick or ailing in body, but just *out of work*, that dreadful West Side affliction which is feared more than the direst sickness. For these men, a vacation of one-fifth of the year taken piecemeal or all at once, meant that the wife went to work to pay the rent and the family went hungry, "Up to the mark all day and every day," as Mr. Galsworthy points out, is the only successful formula for the work-ingman's existence.

Sometimes the disaster strikes a man without a word of warning, just when the family have begun to entertain hopes and to make plans. The Gurneys had just moved into a four-room flat with rent at \$16. They had formerly lived in a rear tenement, but Mr. Gurney, who was a cab driver, thought he was "in steady" for a while. Then one day, Mrs. Gurney, coming home in the afternoon, "saw his boots and his band-box with his hat in the middle of the room." Mr. Gurney was nowhere about. He had gone out again after leaving these silent witnesses of misfortune. Mrs. Gurney threw herself on the bed and wept despairingly. The Gurneys were soon living in a basement.

"Laid off" and "fired" are familiar

words in the family vocabulary. They are among the first Americanisms acquired by the immigrant workman and he can pronounce them with dreadful distinctness. A young Danish woman with gentle manners and refined habits had recently moved to the West Side and was learning English very slowly. In due course of time, her husband lost his place, or, as she put it when I happened in on the very day of the disaster, "Me hoosband bin fired." In this grotesque and sad little statement lay the gist of all the dark possibilities now confronting the Carlsen family. Fortunately, however, these possibilities never arrived, for Carlsen was out only six weeks. In the meantime, his wife took her children to the day nursery and did day's work.

In the group of 370 families there were 283 working children, and of these 28 per cent were under sixteen years of age. In homes where circumstances are poor enough to force the mother into employment, the children naturally go to work as soon as the law permits. There were very few cases where the mother was trying to keep children in school after they were able to qualify for work. For the majority of the women it required heroic efforts merely "to keep the family together." When shelter, food, and clothing are matters of insecurity, education is beyond the possible.

ONE-THIRD of the women visited were widows. There were 125 of these fatherless families where the mother was compelled to perform the duties of both parents and to support a family of several persons on an income scantily adapted to the needs of one. To all these homes disease or accident had dealt a blow which had permanently altered the family structure. The deserting husband may return and take up his responsibilities once more; the loafer may reform and go to work; the man who has lost his job may find another next week or tomorrow—vague hopes like these play their part in the lives of the women whose husbands are still whole and sound. But where disease and accident have done their work the situation of the family is comparatively static. It is true that the widow's children are growing on toward the day when they also will become wage-earners. The precariousness of the family's position is proportioned exactly according to whether that day is near or distant.

Seventy per cent of the total group of 370 wage-earning mothers were employed in some form of domestic and personal service, chiefly outside the home. This included besides public cleaning, which has already been described, work in hotels, restaurants (as waitresses), janitress' work, and kindred occupations.

A lesser group of the women were working in West Side factories. Here

the daily hours are longer but the work is nearer home than the office cleaning jobs. The laundry on the block or the candy factory in the next street,—almost automatically the women apply at these places for work. They may know conditions in the neighboring factory to be especially hard and conditions in a more distant factory to be more endurable, yet they will prefer the job in the nearer place.

The windows of Mrs. Ray's flat faced the rear of the Diamond Laundry. The "Diamond" was well-known for its offenses in overtime. Mrs. Ray could see the women at work there evening after evening and noticed the hour when they went home. In November she remarked, "Them poor souls haven't gone home a night this week till 9 o'clock." But later, when her husband lost his job as driver, she went straight to the "Diamond" to get work. For, notwithstanding the long hours, the laundry windows overlooked her own apartment and its front door was one short block from her own.

THE West Side laundries, in particular—14 in number—are described in a recent report of the state factory investigating commission. According to this report, "Machine washing and ironing, as it is carried on in the motor laundries visited, retains all the worst features of domestic drudgery and adds the further evils of long hours, speeding, and dangerously unhealthful condition."

Here is an extract from an investigator's notebook which describes the home-coming of one laundry worker:

The visitor called at 9 p. m. on Mrs. Sanford, a shaker in a steam laundry. Mrs. Sanford was found sleeping on a sofa near the door, where she had apparently dropped down on coming in from the laundry a half hour before. Her hat lay on the sofa beside her. An old woman was moving about the room and preparing to feed Mrs. Sanford's four-months-old baby which lay in the rocking chair wrapped in a blanket. Neither the operations of the old nurse nor the arrival of the visitor disturbed the laundry worker, who lay across the sofa like a dead person and awakened only when the old woman shook her violently by the arm.

Another extract reads:

Mrs. Ambrosiano came across the street from the laundry at 8 o'clock. She took the baby from Marie and sat down in a chair with the child in her arms. She kept crying as she fondled the baby, "Oh, my back! Oh, my arms!"

A comparison between the work of the women and the work of their daughters points to the changing nature of women's work.

The 370 mothers had 111 daughters who were wage-earners. Needless to say, all of the daughters in these fami-

lies had obtained their working papers at the earliest possible moment. From the list of the girls' occupations, it was found that the percentage in domestic service was a negligible one. Forty-one per cent of them worked in stores and offices and 51 per cent in shops and factories.

Seventy per cent of the working boys were engaged in trade and transportation. They were drivers and helpers on wagons, errand boys, office boys, etc.—that is to say, "runners" of various kinds. Their jobs do not lead to promotions. Only 24 per cent of the boys were engaged in manufacturing occupations.

There are two reasons why so large a number of the youths were found in unskilled and futureless work. The same conditions that cause the mother to work make it difficult for her to stand out for advantageous employment for her children. They must take the first job that presents itself and consider themselves lucky if anything offers. A second reason is simply that trade training is not available.

When we speak of the hours of work of laboring people, we presuppose some hours of leisure. The workingman has an hour at the end of the day when he stretches his legs by the kitchen stove and lights his pipe. Or, instead, he turns into the corner saloon for the miraculous draught which pours the sense of freedom through his veins and wipes out the memory of heavy toil.

But the wife of the workingman who goes out daily to earn has not even this brief hour of freedom. To speak of her "hours of work" is misleading. There is no hour of her day but has its duty, there is no day of her week but has its labors.

Among this comparatively small group of 370 women, almost every variety and

arrangement of working hours known in industry was found. Only a minor group of them, the 23 per cent employed in factories, were in occupations in which the state regulates the hours of labor. The result was that many of them, in occupations ignored by the statutory provisions, worked hours that were excessively long, while for others the working time was unnecessarily interrupted and broken up and irregularly distributed.

THE significance of the length of the working hours in a study of wage-earning women lies in their relation to the home life of the women. Their influence is to be traced in the physical condition of the women and in the condition of their homes. The influence of the hours of work on the wages paid is, as we shall see, less important than might be expected. The women who work by the day, unless in great necessity, do not go out more than five days in the week. They consider that Saturday belongs to their own homes. Some of them who do not need to work more than half time, find they can keep up their homes better by working out three whole days in the week than by taking a regular half-time job that requires attendance on six days.

Many of the short-day workers were public cleaners in offices and theaters, and some of these worked a half day or whole day on Sunday. The working day, which is standardized in some buildings to occupy not more than five and one-half hours, is divided into two "tricks" of three hours and two and one-half hours each. The first is from 6 a. m. to 9 a. m. and the second from 5 p. m. to 7:30 p. m. In some buildings, however, the women work "till they get through."

The hours of the laundry workers, candy factory workers, and other factory employees are regulated by law and limit-

9:15 A. M.—OFFICE CLEANERS GOING HOME.

ed to sixty hours a week.¹ The normal working day for them is from 7:30 a. m. to 6 p. m. with half an hour off for dinner. But overtime is common and I have more than once seen women come into their homes at 9 o'clock in the evening in a shocking state of exhaustion.

Here is an extract from a note book:

Monday evening, March 14. Visitor was present when Mrs. Regan returned from her work at the shirtwaist factory where she operates a buttonhole machine. It was 10 p. m. when Mrs. Regan reached home, having left the workroom at 9:30. Her lips were dry and parched; her voice sounded thick and hoarse, and she swallowed frequently. "You look as if your tonsils might be swollen, Mrs. Regan," said the visitor. "Oh, no," she said, "I'm only tired." Her eyes had a peculiar fixed stare. She was very talkative and began telling a lengthy circumstantial story about one of the day's happenings in the shop. A few moments later she repeated the same story, detail for detail, having apparently wholly forgotten in the meantime that she had told it. In the course of further conversation, she retold two other stories each as detailed as the first. She was in an extreme state of fatigue.

Yet another extract:

Called at Mrs. Murtha's, a costume worker's, at 9 p. m.

Found the kitchen door standing open. The three children were alone and were still waiting for their mother, as they were afraid to go to bed without her. Annie, the oldest, said her mother was working Sundays, too, as it was rush season at the shop.

THE hotel workers, as well as the factory employes, furnished instances of excessive hours. That the women are submissive to these conditions is undoubtedly due, at least in part, to the complete stultification of spirit to which a life of monotonous toil has reduced them.

The hours of full-time waitresses in restaurants are excessively long. In most restaurants they must be present from 8 a. m. to 8 p. m. Scarcely any woman who is keeping up even the pretense of a home can undertake to work as a full-time waitress. Yet there was one woman on my list who was doing it,—working seventy-two hours a week. During the twelve hours of her daily absence, her little boy was cared for in the public school just six hours. For the remaining six, he lived in doorways and on the street. There is, however, considerable opportunity for half-time and part-time work in restaurants. The heavy rush of patronage during the luncheon hour makes it necessary to employ extra waitresses for the midday meals. The hours of this work make it attractive to the mar-

¹This investigation was made before the amendment to the labor law was passed reducing the legal limit of working hours for women from sixty to fifty-four hours a week, which went into effect October 1, 1912. A law prohibiting the employment of women in factories before 6 a. m. or after 10 p. m. went into effect July 1, 1913.

ried woman who finds it necessary to earn.

A considerable amount of Sunday work was discovered. In fact, 10 per cent of the 370 women were working a half day or whole day on Sundays. There is something scarcely less than monstrous in the situation which requires the mother of a family to go to work seven days in the week. Mrs. Mary Carter, who had been a cleaner at the same concert hall for the last six years "off and on," had two children, one daughter of five and another of eight months. Mrs. Carter said she was "even more foolish about this second baby than about the first." When the visitor called one evening, the mother was admiring the baby as it "sat up." "It's the first time I've seen her do it," she explained. "You see I work Sundays, and she's generally too sleepy to play when I get home nights."

There is some night work as well as Sunday work among theater charwomen. Each time a new play is put on, the stage is thoroughly scrubbed. As this is a very special chore outside the usual day's work, it always means night duty or overtime. Some moving picture shows which are open all day and every evening are scrubbed at night. The women go to work at 11 p. m. and return home at 7 a. m., seven nights in the week. One woman had a four years' record of work in such a place.

Seasonal variation in their work is another difficulty with which the women who must have regular work are compelled to contend. Many of the theaters close for the summer; the laundries and candy factories and garment factories are slack in that season. A few of the women manage to dovetail two fairly regular occupations. However, combinations of employment mean a change from one dwelling to another or other changes to which a woman with a family finds it difficult to adjust herself. She has not the mobility of an unmarried worker. Moreover, the finding of two occupations to fill out the year requires more ingenuity than the average working woman can be assumed to possess.

THERE is no free municipal or state employment agency at which these women may apply, as they might if they were, for instance, in the state of Massachusetts or of Wisconsin. The National Employment Exchange of New York, maintained by public spirited citizens, is an agency which aims to bring together the job and the man, with the least possible waste and expense to both sides. But the field of the exchange is limited to manual labor for men, and office work for men and women. It does not handle the manual work of women.

In the meantime, the women of the tenements roughly co-operate to help each other get work. Over half of the West Side women, when asked how they had secured their position, replied that

they had got it "through a friend." The women feel a strong sense of mutual responsibility. It does not occur to them to seek any immediate reward for their services from either side. It is enough for them if they can thus "square themselves with the boss" and secure a friendly fellow worker.

In the following table the weekly earning of the mothers, including part-time and full-time workers, are given. For the sake of establishing a standard, it is assumed that the current earnings of the workers were continuous through the year:

WEEKLY EARNINGS OF 370 WAGE-EARNING MOTHERS

Weekly Earnings	Num-ber	Mothers Per cent
Less than \$1.00.....	3	.8
\$1.00 and less than \$2.00....	16	4.3
\$2.00 and less than \$3.00....	34	9.2
\$3.00 and less than \$4.00....	47	12.7
\$4.00 and less than \$5.00....	48	13.0
\$5.00 and less than \$6.00....	43	11.6
\$6.00 and less than \$7.00....	77	20.9
\$7.00 and less than \$8.00....	39	10.6
\$8.00 and less than \$9.00....	19	5.1
\$9.00 and less than \$10.00..	19	5.1
\$10.00 and less than \$11.00..	9	2.4
\$11.00 and less than \$12.00..	2	.5
\$12.00 and over.....	14	3.8
Total	370	100.0

There seems to be something approaching a standard amount paid which has small relation to the sort of work done or the number of hours worked. This approximates a dollar a day for each working day of the week.

SUNDAY work is the only thing which is almost certain to increase wages. The seven-day workers are likely to earn more than the standard wage of \$6.00 a week. One-third of the women working Sundays were being paid \$9.00 a week and the average for the whole group (37 in number) was \$7.50. The reason for the better rate is apparent. No woman, even when pressed back to her last bulwarks, will leave her home and children to go to work on Sundays—except for a premium. Mrs. Manley, who cleans the office in which this report is being written, works six days in the week for \$6.00. Just after her husband's death, she used to clean in a nearby theater seven days in the week for \$9.00. "But I couldn't keep that up at no price," she said. "My Annie used to cry so about my going off on Sundays. 'It's just as if I didn't have no father nor mother either,' she'd say." So Mrs. Manley sacrificed a third of her income to stay at home with Annie on Sundays.

But short of Sunday work, it did not appear that long hours made for higher wages. In fact, many of the lowest paid workers were laundry employes toiling sixty hours a week. Some of these women were receiving but \$4.50 for the week's work. I asked one of them, an

Widows' Needs

By Edward T. Devine

TO assemble and interpret the experience of philanthropic and other social agencies in New York city in relation to the relief of widows with young children was the purpose of the report from which this article is condensed. The aim is to present an impartial description of the actual situation in New York city; and, to discuss some of the elements involved in the social problem, not of widows' pensions but of widows' needs.

From the nature of the study, i. e., of widows with small dependent children, it is obvious that we are considering families in which there has been a premature death of the father. That is to say, the ages of the mothers and of the children testify that it is in the prime of life that the husbands have gone to their graves. This is perhaps almost the only respect in which these families may be said to present a uniform likeness to one another.

Everyone has in mind a typical mother of fatherless children, but the most striking generalization to be made from this study is that there is in fact no such type. There is no widow about whom statements of universal applicability can confidently be made. There are Jewish widows, Italian widows, Irish widows, and widows who were born and raised in New York. There are capable and incapable, strong and delicate widows. There are widows resourceful as the sturdy oak and others dependent as the clinging vine. There are sober widows and drunken widows; angelic widows and demons in widows' form; good mothers and indifferent mothers; widows who are infinitely better off than they were before they become widows, and widows whose widowhood is tragedy and pathos beyond telling.

For the most part the families of the widows who ask for aid have been living at a very low standard before the husband's death. In many instances they have had charitable assistance in his last illness, and such assistance has frequently also been sought in previous emergencies. The wife has more often than not earned a part of the income during her married life.

In exceptional instances the family had maintained a high standard during the father's life time, and these exceptional instances are apt to be remembered and regarded as typical. A critical examination of the records discloses that before his death as well as afterwards the income had usually been small and irregular; sickness and misfortune had been all too common visitors in these families, children had been anæmic and abnormal, the tenement small and unsanitary, and savings conspicuous by their absence.

The occupations and wages of deceased husbands were ascertained in 488 cases. Of these men, 28 had been earning less than \$8 a week—four of these because of physical incapacity and eight because of some mental or moral weakness concerning which definite knowledge was obtainable; 238 had been earning from \$8 to \$12 a week.

These figures, although fragmentary, indicate that the wages as a whole were low, and that the representatives of the skilled and semi-skilled trades were among the least efficient, or at least the lowest paid, in their trades.* This would also indicate that even the death of the chief breadwinner does not ordinarily force families in the higher wage groups to resort to relief societies. Apparently the better paid wage earners do to a large extent provide for their families by insurance or otherwise.

From the families included in this study the cause of the death of the father was ascertained in 1,225 cases. Of these the leading cause of death was tuberculosis, which claimed 480, or nearly forty per cent. Pneumonia is held responsible for 126 deaths, heart disease for 109, industrial accidents for

59, other accidents 72, cancer 46, violence 35, suicide 23, typhoid 22, insanity 25, alcoholism 10.

In the 480 families in which the father died of tuberculosis, there were 1,287 children under fourteen. In the 59 cases of fatal industrial injuries, there was a record of a satisfactory settlement in only four cases. In more than three-fourths of the deaths which occurred in the course of employment the family, so far as the records indicate, received no compensation whatever. Most of the others would apparently have come under the new compensation law of New York State, insuring to the widow from 30 to 66 2/3 per cent of her husband's wages during the whole of her widowhood, and in case of re-marriage for two years additional.

Between the exhaustion of the meagre insurance and application to a charitable society there is often a period of uncertain duration in which the church and relatives display their maximum generosity. This is a period of anxious experiment in various directions, of readjustment and important decisions. If an opportunity for sound advice could be given at this stage, instead of weeks or months later after such personal resources are exhausted, there would be a better chance of a successful issue.

When application is actually made the mother is apt to be more or less demoralized by uncertainty of income and other circumstances which she is ill prepared to meet. If she is ambitious and has a mother's normal devotion to her children, she may be quite worn out by her unguided or misdirected efforts at self-support. If of a hopeless and helpless disposition, she may have yielded to the first suggestion that her children be sent to a home, but may none the less be yearning to have them with her again. She is almost certainly living under intolerable conditions, in miserable, dirty, overcrowded, underlighted, and underfurnished or badly furnished rooms.

Widows in New York City

The total number of widows under the care of the six charitable societies in New York whose records were studied in the fiscal year 1911-12, was 5177. This is less than three per cent of the total number of widows in the city and a little over ten per cent of the number of those gainfully employed. A few of the other ninety odd per cent may apply to other charitable societies or to the Department of Public Charities, but it is evident that an overwhelming majority were taking care of themselves, with such assistance as they may have had from insurance, savings, or other personal resources.

From the census it would appear that

THE REPORT.

This report was drafted for a voluntary committee, which for a year past has been investigating matters relating to the care, treatment, and relief of dependent widows with dependent children in the city of New York. [See Common Welfare pages.]

It is based upon material gathered by Francis H. McLean, executive secretary of the committee, and a staff of trained social workers.

An examination was originally made of 1,556 case records, of which 391 were supplied by the Charity Organization Society; 379 by the New York Association for Improving the Condition of the Poor; 278 by the United Hebrew Charities; 300 by the Brooklyn Bureau of Charities; 168 by the Brooklyn Association for Improving the Condition of the Poor; and 40 by the United Jewish Aid Society of Brooklyn.

Later complete summaries were prepared for the writer of 300 records 50 from each of the 6 societies, taken consecutively as they happened to come, in such a way as to preclude the possibility of any attempt to make a favorable or an unfavorable showing of the work of any particular society.

An examination was made also of the applications for the commitment of the children of widows at the Department of Public Charities, both in Manhattan and Brooklyn in the calendar year 1912. It was found that there were 460 such families from whom children were received because of the "death of the father."—Ed.

Three questions may be formulated clearly from the many which presented themselves at the threshold of the inquiry

I

THE QUESTION: *Are children in any considerable number separated from their widowed mothers, to become public charges in institutions or foster homes, who should instead be kept at home with their mothers, whatever financial assistance is necessary to make this possible being supplied?*

THE ANSWER: That the separation of children from good mothers, well qualified to care for them at home, and unable to do so only because of poverty caused by the father's death, is not of frequent occurrence. In four-fifths of the four hundred and sixty families from which children were received as public charges in the calendar year 1912 because of the father's death, there were demonstrable conditions, such as serious illness, improper guardianship, mental deficiency or insanity, which made it appear inadvisable for the children to remain with the mother. In nearly or quite all of the cases in which the children should have remained at home, concerted action by public officials and voluntary agencies, such as actually occurs daily in many cases, could probably have prevented commitment.

II

THE QUESTION: *Are widows who apply to one of the charitable societies or to their church for aid receiving proper consideration and care? Are reasonable plans made for them, and are there sufficient resources to carry such plans into effect?*

THE ANSWER: That the charitable societies do give admirable care in many cases to those who apply to them for assistance; that they have a high and constantly improving standard of work and are realizing their ideal in an increasing proportion of the families whom they attempt to aid; but that, if the actual improvement of conditions in the families be the test, then the results leave much to be desired. In a large number of cases, in spite of whatever aid is given, the health of the mother or of the children is impaired, and progress towards genuine family rehabilitation does not take place.

III

THE QUESTION: *Are widows who are obliged to earn their own support and that of their children, in whole or in part, working under reasonable conditions? Or are they, by any reasonable standards, overworked and underpaid?*

THE ANSWER: That, as far as the self-support of widows known to the charitable societies is concerned, the conditions of their employment, largely because of their limited efficiency, and the resulting limited opportunities open to them, can be described only as unsatisfactory in the extreme. These women are engaged mainly in unskilled occupations in which the wages are low, the hours long, the physical strain severe, and the inducements to exceptional skill or efficiency conspicuously lacking.

working women engage in a great variety of occupations. In some of these the wages of women are sufficient to maintain a decent standard of living for a family and the hours and conditions of labor are reasonable. The case records of the charitable societies disclose no such variety, and in the employments in which the working widows known to them are mainly employed, the hours and conditions of labor are for the most part unreasonable. This is clearly one of the most important and, except among those who have attempted to find suitable employment for working mothers, one of the least understood factors of the whole problem.

The situation which exists in this respect may be of little or no interest to those who take the extreme view that widows with children should not be expected to work at all. They may consistently be indifferent to the details of the employments open to working women. No such indifference, however, exists among working women or among those who are daily engaged in helping them, now with money relief and now in finding work, according to their needs and strength. To the mothers themselves

it seems natural, inevitable, and appropriate that they should work. Most of them have worked before marriage, many of them have worked during their married life, and that as widows they should earn a living for themselves and children is simply in the course of nature, an obvious and unquestioned obligation. What they feel is that the mother should work—not of course if she is nursing an infant in arms, or about to be confined, or if she is seriously ill, or if there is some extraordinary demand upon her in the home, such as an invalid child demanding constant attention, or a large number of very young children, and no older person in the family to look after them.

Looking more closely at the occupations in which the working widows in these families are engaged we find that they are mainly characterized by long hours, severe physical strain, and either low wages or exceeding irregularity and uncertainty of employment. The Italian widow, finishing pants, working excessively long hours, often with the help of children, may clear three or four dollars a week. If she goes out to day's work in some family in the tenements

but little better off than herself she may get fifty cents for a day's washing. The Russian Jewish widow may finish garments at home for about the same wages as those of the Italian; or go out peddling, at which for a shorter day the earnings may be four or five dollars a week; or keep roomers, with the inevitable results of an overcrowded apartment. The Bohemian widow is apt to work, as before her marriage, in cigar factories, earning when skilled eight or ten dollars a week, or more in exceptional cases. The Greek widow is more likely to be found in a candy shop, again at factory wages. Irish and German widows are more generally inclined to do office cleaning or day's work,—washing, ironing, and cleaning—for which the usual pay is now a dollar and a half a day, sometimes with carfare, usually with food in addition; but this work at such pay for the women of whom we speak is scarce, and for the maximum pay women who come in for the day are often expected to do a heavy washing and ironing, sometimes with scrubbing of floors and cleaning of windows between.

Thus widows who ask for aid are ap-

parently restricted in their occupations mainly to finishing work in the needle trades; office cleaning and similar work in the theaters, stores, and other public buildings; and days' work, consisting either of washing and ironing done at home or washing and ironing and cleaning in the home of the employer. The restriction to these occupations is clearly for two main reasons. They demand only a low grade of efficiency, and they do not demand the regular hours of an ordinary office or factory working day. They are unorganized and unsupervised employments. Neither trade union nor factory inspector controls them. There is no standard public opinion in regard to them. In return for the privilege of having some free time each day, or some free days each week, the working mother pays a price which is exorbitant, partly because there is no available means of measuring it.

The fundamental objections to home work, when a "home" means a New York flat of two or three rooms full of lodgers and children, are so serious as to have led to the demand for its total abolition on grounds of health and morals. The police power of the state has already been invoked to this end, and the transfer of all factory work to factories, which can be properly supervised, in which rational sanitary standards can be maintained and in which wages can be determined at least under public scrutiny, is now only a matter of time. Washing and ironing which is taken away from the home will probably eventually be treated as factory work.

This is not at all inconsistent with a movement in the contrary direction which may eventually increase the amount of remunerative domestic occupations,—for example, through the development of co-operative house keeping, or through the organization of specialized service by the hour, including all types of workers from cleaners (with work transformed by science) to efficiency engineers.

The bearing of this on our present subject is that it is precisely in the families of the widows who need help that the severest pressure is felt from the present unregulated, irregular, and underpaid employment.

The Three Occupations

The finishing work done at home is hard because of the excessively long hours necessary to earn anything at all. It is dangerous because of the opportunity which it gives to work and overwork young children. It has all the disadvantages of isolation on the part of the operative and utter lack of knowledge as to the conditions of the employment on the part of the public.

Office cleaning and some other work of charwomen is hard because of the back-breaking, knee-destroying positions which it demands; because of the

indecent of requiring women on hands and knees to clean up the expectorations, the cigar stubs, the tracked-in-mud and other refuse of those who come and go in public halls and stairways, because of the often exceedingly inconvenient division of the working day into two parts; and finally, because women employed in this work are paid less than men cleaners. The wages paid vary considerably, and there are some large office buildings in which every consideration is given to the home demands upon the women, not only in adjusting their hours, but in determining wages.

It is true also that numerous unsuccessful attempts have been made to devise mechanical means of doing this cleaning, and that, temporarily at least, it would be a great hardship to many earning mothers if, by the success of such attempts, this kind of employment should be eliminated. But it is not unlikely that the substitution of mechanical cleaners would be greatly expedited if superintendents of buildings were no longer able to employ six women for the price of three men.

Going out for day's work in families that can afford to pay a dollar and a half a day is, on the whole, the most popular occupation open to these women. Such opportunities exist largely because of the transitional and unsatisfactory conditions of domestic service as a whole. But they are constantly interrupted by the migration of employers in the summer and by their desire for economy, as shown by having the washing done only once in two weeks in the winter, or by asking the employe unexpectedly to leave in the middle of the afternoon, perhaps after finishing the washing and ironing, to save one-third of the day's wages.

Taking these occupations, however, as a whole, the worst thing about them is that they are the occupations of relatively unskilled and inefficient workers, and the worst thing to be said about the workers is that they are for the most part fit for no other kind of employment. They are untrained, inefficient, industrially unfit. No employment agency would be justified in putting them in skilled occupations, even if these were to be had. No employer who demands and is ready to pay for competent work would keep them even if they came. This general lack of competency is not confined to the widows, but was shared, as we have shown, by their deceased husbands. Probably it cannot be very much modified in the adult generation, but it is a very serious question whether it is to be perpetuated in the next generation.

The charitable societies are dealing with persons whose labor in the open market has very little productiveness, who not only have not had specific training in particular trades, but have not learned how to work or to protect their interests as workers. To change these conditions is not within the function or

the power of the charitable societies. Education and industry must bear that responsibility.

Vocations for Widows' Children

The records of the societies do not show sufficient evidence of serious and practical interest in the choice of an occupation as the children come of working age or in securing specific preparation for a suitable occupation. If the boys and girls are not to repeat the experience of their parents or even to fall short of their level, they must obviously be encouraged, and if necessary aided, to get into occupations in which there is apprenticeship, opportunity for learning how to work, personal interest on the part of employers or foremen or fellow workers, that will lead to the steady development of ability and increasingly satisfactory adjustment between the worker and his employment. The safeguarding of vocational interests of individual members of the family is the most important single service which can be given them.

Vocational guidance may ultimately be expected from the public school system. Even the actual teaching of a trade or preparation for commercial positions may become the rule. So long, however, as such facilities are as rare as they are at present and limited mainly to high school grades, there will be urgent need of giving increased attention to the exceptional danger that in these families of working widows the interests of the children will be completely sacrificed, that they will go into occupations in which the only inducements are an immediate wage to replace or supplement the mother's earnings.

The old apprenticeship system is gone, and it is for education or industry to discover a substitute. Practical vocational and half time schools through which children as they reach working age can be adjusted to industry and trade may prove to be such a substitute. Public pensions and voluntary relief are alike impotent to solve the problems of industry and education.

Health

Most of the societies in question have themselves, through their tenement house committees, tuberculosis committees, fresh air activities, and in other ways, distinctly taken the lead in that educational campaign for the prevention of disease to which increased interest on the part of the public is so largely due.

The question naturally arises as to whether this interest in the public health is translated in practice into an effective interest in the health of widows and their children as shown by the case records examined. Such effective interest is frequently, although not by any means uniformly, shown. In many cases excellent work is done to secure proper diagnosis, and appropriate treatment. Some-

times persistent attention is given to a health problem over a period of several years. Often large sums of money are expended to provide necessary convalescent or sanatorium care.

One society has a physician in constant attendance at its own offices to make a diagnosis on the spot of all cases in which disease is suspected. Another has a home hospital in which a few of the families threatened by tuberculosis are taken completely in charge at an average expense of \$1,000 a year for each family, all of which is provided if necessary from charitable sources, in addition to the expert and professional service required. Others command a large amount of volunteer medical service from members of district committees and other physicians, and all of them make daily use of dispensaries and other health services. One society maintains a corps of thirty trained nurses who visit and nurse the sick poor.

The idea may be said to be generally accepted that inquiries about health should be made, that those who seem to require medical attention and are not receiving it shall be examined and advised, that obviously suitable candidates for hospital and dispensary care shall be taken or urged to go for such treatment, and that the relief policy adopted shall be influenced by health considerations. In other words, immediate and obvious health needs usually—though not always—receive attention.

More fundamental health needs are however, it must be said, often neglected. Vigorous action is not always taken to carry out competent advice after it is obtained. Mothers are allowed to work when it would be quite appropriate to provide such an amount of relief as would make employment unnecessary.

Of course, the charitable societies cannot be held responsible for all the serious or petty illnesses in the families under their care. Tuberculosis and typhoid fever appear in well-to-do homes also, and conditions inimical to health, such as too frequent pregnancies and overwork, have been present long before the husband's death or other special misfortune brought them to the notice of the societies.

Nevertheless, when instances are found in which the records themselves bear evidence that anaemic, undernourished children fail to receive special care, that no attempt is made to follow up and remedy some well recognized dangerous condition, that eyes, or teeth, or adenoids are neglected, that prevention of disease and the upbuilding of physical vigor and resisting power is left almost wholly out of the plan for the family, there is certainly room for drastic criticism.

It is pertinent to call attention in this connection to the extraordinary change

in public appreciation of health needs. Perhaps it is hardly an exaggeration to say that the health of the children in the tenements, including the children of the families here under consideration, does actually receive more effective attention than was ordinarily given to the health of the children of well-to-do families a generation ago. In this advance the charitable societies have played a distinguished part; but these ideals have outrun the best efforts of the best societies.

Judged by this new standard of public opinion, and by the highest standards of organized charity itself, there is no one of the six societies whose records do not show instances of failure to anticipate the inevitable results of unduly severe physical strain on the mother and an inadequate income. In every society there are cases in which knowledge of what is needed failed to issue in doing what is needed. While they share the responsibility with others, including the families immediately concerned, they cannot escape the responsibility for having failed, as shown by their own case records, to go as far as they should have gone in many instances.

It is true that there is often a lamentable failure on the part of the patient to realize the need of treatment, reluctance to accept advice, and even stubborn opposition to the most necessary and urgent action. Another difficulty is that when forcible removal would be desirable, the city authorities may refuse to act or to carry out consistently even their own decision that removal is justified. Preventorium care for the young children in close connection with sanatoria for mothers might in many instances overcome the reluctance of the latter to leaving home. To give a pension or relief at home is to accept a measure of responsibility for a recognized dangerous condition, and to withhold relief in the absence of reasonable institutional provision seems uncharitable.

Lack of Institutional Facilities

In justice to the societies and to the families it must be recorded that neither the state nor private philanthropy has by any means as yet provided adequately for the institutions and agencies of various kinds which are imperatively demanded if health needs are to be met.

For the feeble-minded, the crippled, the infirm, and the convalescent there is not sufficient provision. We have not enough hospitals for those who have contagious diseases or even for those who are afflicted by tuberculosis, notwithstanding all the efforts which have been put forth in recent years to supply the latter deficiency. Again and again special treatment of one kind or another is prescribed or quickly discovered by the visitor to be needed, but because of the lack of any provision for the treatment it cannot be secured. Almost every

type of institution is indeed represented; but that is not enough.

So far as the individual needing care is concerned, an institution without vacancies is of course precisely as good as no institution at all. The pressing problem is quantitative.

It is not easy to get intelligent, conscientious medical treatment. Some dispensaries on which reliance must be placed make the most superficial examination of patients and provide no method of following up their diagnosis or prescription. It is impossible to arrive at an accurate understanding of the health needs of a family through such facilities for diagnosis as are provided by many of the medical agencies. When a careful examination has been secured from a physician in private practice, or from a medical member of the staff, or even from the dispensary itself, it is rarely that such a diagnosis can be followed by effective treatment. In many records it is definitely stated that there is need for convalescent care which cannot be secured because there is no vacancy in an appropriate convalescent home, and a visit to the country or seashore would not meet the need. Even more serious is the lack of co-ordination between medical agencies which are simultaneously or successively treating a particular patient. The excellent plan devised for the tuberculosis clinics is obviously needed in every other department.

Housing

Fundamental as a community health need is that for good homes, with real light, fresh air, accessibility, and a reasonable rental. Through their tenement house committees, tuberculosis committees, and otherwise, the societies have constantly emphasized this fact. They have secured the passage of tenement house laws which make the evil conditions of even ten years ago impossible. These splendid educational campaigns impose a new responsibility on the societies themselves as relief agencies, a responsibility which they do not fully meet. Many of the families studied are living in wholly unsuitable tenements, plainly described in the records as such, but for lack of better accommodations at a possible price, or for lack of funds to pay higher rents, serious attempt at improvement is out of the question.

Notwithstanding the difficulties, it is likely that a more clearly defined policy, including a readiness to move families some distance from their present location when there are no strong local ties binding them to it, might result in a considerable improvement. Rents have increased, and the societies, if they are to provide adequate relief in this respect, must take this fact even more fully into account. Paying rent in congested quarters or unsanitary rooms tends to lower instead of raising the standard of living. Serious attempts have been made

to substitute a contrary policy—one society having obtained funds for this purpose—but this requires larger financial resources than have ordinarily been available.

Emergent Relief

Emergent, temporary, and what is sometimes called interim relief, *i. e.*, relief given to meet immediate needs while an investigation is in progress upon which more permanent plans can be based, is supplied by all of the six charitable societies, sometimes in a rather erratic way and in not very appropriate form, but as a rule in such an amount and kind as to prevent suffering from lack of food, clothing, fuel, or shelter.

From the point of view of the community more than this is desirable. It is desirable that similar needs in different families shall be met with some approach to consistency; that there should be some degree of uniformity and standardized relief among the general relief societies.

If the inquiry had extended to the numerous religious, national, and special relief agencies of various kinds, the diversity of methods and of standards would have been found vastly greater and the evidence of the resulting confusion and uncertainty as to what would happen in any given case of need correspondingly increased.

It is not true that those who ask for aid are left to starve, or to suffer other preventable hardships, while long drawn inquiries are made about them. Investigations in fact in some societies are less thorough and careful than is desirable, their apparent purpose being to detect fraud rather than to lay the basis for a sound decision as to what action should be taken. The pioneer agencies in developing a technique of more thorough investigation and a course of treatment logically based upon it are the charity organization agencies, whose methods in this respect are now in use in all of these societies in varying degrees of efficiency. Even greater thoroughness and a more careful and painstaking plan of action at the time of first application than now generally prevail would be desirable and would save a vast amount of subsequent work, after the best opportunity has passed. This applies pre-eminently to the families of widows with small children, for whom continued aid is the rule rather than the exception.

Permanent Relief

We now come to the subject which many will perhaps regard as the crux of the problem, the continued relief supplied to those families of widows who because of illness, or the number of their children, or any other reason, require regular and substantial assistance.

Perhaps the most striking impression made on the credit side, taking them all together, is their patience, courage,

and persistence in dealing with the individual family problems in the face of the difficult task imposed upon them by such conditions as we have already discussed and those to which we have still to call attention.

The relief which the societies supply is sometimes inadequate in amount and sometimes the basic plan upon which it is given is inadequate and ill-considered, but the instances of failure with respect to suitability of employment, fundamental health needs, attention to the individuality of children, the securing of an attractive and sanitary home, and other essentials of family life, are more numerous and more serious than the inadequacy in the amount of relief.

The giving of special diet, attention to decayed teeth, not only as a cause of needless suffering and disfigurement, but as a channel of infection, a lookout for mental deficiency or backwardness requiring special attention, and the general examination for tuberculosis and similar infections are striking illustrations of the advancing standard of family service set for themselves by the societies.

Good work is done in many cases with good results. Good work is done in many other cases with no manifest results. In still other cases improvements on the one hand or deteriorations on the other, may take place independently of any particular relief or service rendered by the society, and in still other cases things drift along with no evidences of any particular change for either better or worse, whether relief is given or withheld.

The results, as we have said earlier in this report, leave much to be desired. A large proportion of all the records bear witness to a very limited success in securing normal conditions for growing children or to any decided improvement in the conditions of family life. We have next to ask for the reasons for this limited success.

One possible explanation, which should have candid consideration, is that the physical, mental, and moral constitution of the individuals in the families in question is inferior.

We have seen that the charitable societies come in contact with from three to ten percent of the widows in New York city who have small children dependent upon them. What might be said is that this small percentage includes nearly all of the least efficient, the least capable, the degenerate, the unfit.

No wonder then that the conditions of their family life do not improve; that the health of the mother breaks down whether she is at work or idle; that tuberculosis and alcoholism find congenial soil; that children inevitably show on the whole the same weaknesses as their parents; that most of the high hopes based upon their coming of work-

ing age result in disillusionment as they arrive at an age when their inherent lack of energy, of ambition, of responsibility, become apparent.

If it is only a question of degree, there is undoubtedly some truth in this explanation. To meet these needs, the societies are pressing vigorously for suitable institutional care for the demonstrably feeble-minded; for reformatory correctional care of those who need institutional discipline; and for surgical or medical attention to those for whom operations, hospital or dispensary treatment, or professional advice would be beneficial.

Visiting nurses, visiting school teachers, church visitors, and conspicuously the agents and visitors of charitable societies, may justly claim to have been the first, as they are still the most active, allies of those physicians, perhaps a minority in their own profession, who are trying to promote conservative eugenic policies, to segregate the feeble-minded and unsound, to remedy physical defects when possible, and to secure for abused and neglected children the protection which society owes them. This is what they are doing in their daily rounds. To assume that social workers in the charitable societies are almoners, or are merely investigating the need for relief, is to betray gross and inexcusable ignorance of their work.

Social Causes of Poverty

The second explanation to be considered for the lack of improvement in some families—and here we are upon surer ground—is that the overwhelming mass of human misery, of which the suffering and dependence in these few thousand families of widows is but a part, is the result of causes and conditions with which both voluntary charity and public relief as such are powerless to deal.

Tuberculosis, typhoid, fatal industrial injuries, insufficient pay, economic inefficiency, the physical strain of overwork, the exploitation of the vices and weaknesses of men and women for commercial profit, are all subjects with which social workers in the charitable societies are deeply concerned, but for which the remedies lie in other and more powerful hands.

Concerning the great creative forces of the misery which they are called upon to investigate and relieve in individual instances they can only lift up their voices in eloquent testimony. They may testify also, as has been intimated, to human weaknesses, to lack of energy and resistance, to the fact that some human beings are apparently from their birth doomed to failure in any severe life struggle. But they may well be appalled when they see such weaker persons, and others not by any means unfit for any reasonable struggle, subjected to uncontrolled infection, to overcrowding, to overwork and injurious strain, to in-

geniously fiendish temptations such as the strongest would not resist under similar circumstances, to a necessity of paying the highest prices for inferior, diluted and polluted commodities and services, and to the further necessity of providing from their own insufficient resources, and by their own inadequate efforts, for such contingencies as sickness and death in the family, for child-birth, for infirmity and old age, for unemployment whether due to personal fault and inefficiency or to industrial causes affecting an entire group or an entire community of workers.

The Need for Workers

In the third place consideration must be given to the causes for unsatisfactory results which lie within the societies or in their financial resources. The most glaring need, as shown by the case records, is one to which their officers and directors have long been alive, but which for various reasons still remains serious. This is the lack of a sufficient number of capable trained visitors to do the work of their relief departments. There is not merely a lack of training and of special ability for this work; there is a lack of a sufficient number of workers of any kind. To each visitor is given responsibility for far too many families. Districts are too large. The pressure of emergent work is so severe that there is little opportunity for quiet, deliberate consideration about difficult situations. There is of necessity too much of perpetual emergency rush and too little time and insistence upon thorough and constructive plans.

Even however if there were enough visitors and supervisors to do the work, it would not be satisfactorily done without a higher standard of selection, of professional preparation, and of compensation. This is a very distinct kind of service calling for altogether exceptional qualities. Mere physical endurance is severely taxed by it. The power to think—to observe, and to form sound judgments—is essential. No superior spiritual quality comes amiss in the complex human relationships which an investigation and the resulting care of a family involve.

Professional training schools are now available for the more direct and complete preparation of those who have the general education and personal equipment required for this exacting work. By a preliminary study of methods and technique, and by supervised field work in connection with such study, a qualified candidate for social work will not only save the time and money of the society, but will lay the foundation for a kind and amount of genuinely helpful service that can scarcely be gained even by the most competent person who has had no such preliminary training.

In at least four of the six societies

it will be necessary to increase salaries substantially if such qualified and prepared visitors are to be secured and retained against the competition of other kinds of social work and other outside vocations which appeal to the same kind of workers, or if, quite aside from such competition, visitors are to keep themselves physically and mentally fit for their work.

Danger of Routine

The impression made by the examination of a large number of records in rapid succession is that the societies are in danger of falling into a narrow routine, covering only a comparatively small number of the items necessary to successful relief work. In most instances attention is paid to relief, even though the amount given may not be adequate; to appropriate relief responsibility, whether it should come for example from church, employer, lodge, or relatives; to keeping wage earners at work; to emergency health needs; and to school attendance.

Less often is serious attention given to fundamental health needs, to vocational interests of children, to discrimination between possible places of employment for wage earners, to recreation, or to moral and spiritual influences. Grave suspicion of the immorality of the mothers has in some instances served as a reason for withdrawing relief, regardless of the children. Such a suspicion in the mind of a competent visitor is only ground for more careful and effective work. There is too little individualizing of children, and in many cases no satisfactory account of the care which they receive while the mother is at work.

No one can tell to what extent the amount available for relief is insufficient until competent service is the rule rather than the exception; but that in cases of need for continued relief the amount actually given is often inadequate, is certain.

In fairness to the societies it must be recognized that no case records can fully disclose the quality or amount of work done or the actual relations which often exist between a district secretary or a visitor and her families. These personal relations may become a vital factor in securing most gratifying results which are not disclosed, because visitors are naturally reluctant to describe them. Records are not kept for the purpose of presenting the societies and their workers in a favorable light. They are kept mainly for a very practical purpose,—to enable the societies when action is necessary on behalf of the family to act intelligently, on the basis of previous experience, and without the necessity of repeating an investigation once thoroughly made.

We may now return to the first of our three original questions; as to whether children are committed who should re-

main with their mothers, the only reason for such commitment being the poverty of a widowed mother.

The consensus of opinion from every group of social workers whom we have been able to consult, and the evidence of the records in the bureaus of dependent children in the Department of Public Charities, is that this is very exceptional, and in so far as it does occur, wholly unnecessary.

In 335 of the 460 families of widows from which children were committed in 1912 for the assigned cause "death of the father," there were conditions present other than poverty which seem to justify the commitment.

Neither Help nor Commitment

In 25 cases neither commitment nor help at home was really necessary, as the later records show in each case either that the child did not actually go to the institution although commitment was formally approved, or that the child has since been discharged to the mother or relatives and is being properly cared for under circumstances substantially identical with those which existed at the time of application for commitment.

In 100 cases, a little over twenty per cent of the 460 (involving less than four per cent of the total number of children committed in the year for all causes) a sympathetic examination of the records in the department of charities and in the societies, supplemented by a visit to the families when there was no society record, indicates that commitment might have been prevented by assistance at home.

The examination of the records of these families from which children are committed leads to certain distinct impressions.

Most fundamental is the abiding impression of the futility of any or all efforts combined to make good to a family the loss of a husband and father who has played his full part in the family previous to his fatal illness. Coupled with this is a sense of the complexity of need presented by these families.

In the families from which applications for commitment are made, there is an impression of terrible struggle to make the few dollars remaining from insurance or savings after the husband's death, stretch over as long a period as possible—a period, however, of increasing poverty, decreasing strength, and multiplying dangers to the family. The high cost of funerals and the close approximation of this funeral expense to the amount of the insurance constantly force themselves upon the attention.

Some at least of the cases of immorality of the mother seem to have been fairly attributable to the presence of a male lodger, or to the fact that the mother keeps house for a widower, typical means of income to which some widows are almost forced by necessity.

Similarly the incorrigibility and truancy of children from seven to ten years of age, mention of which frequently occurs in these records, seems to be to some degree occasioned by the fact that an aged grandmother or other female relative has been suddenly charged with the unfamiliar and difficult task of disciplining boys of the "big Injun" age. On the other hand a young grandmother is often the most steadying influence in the Italian family. Except for her presence the attempt to keep the children with their mother would be much like turning loose a lot of children to bring up one another.

In this connection the question fairly arises whether mothers who support themselves and their children entirely without assistance are doing so only at an ultimate sacrifice of health and of maternal home care, and thus of permanent welfare, which society cannot afford. Naturally this study throws only indirect light on this question, since there has been no direct study of such families.

It is however a fair inference from the facts and impressions made by the records of the families known to the charitable societies and to the bureaus of dependent children, that the real hardships and handicaps encountered by independent working mothers, like those to which we have called attention as arising in the families under consideration, are for the most part such as can be removed only by industrial and social changes, by radical changes in the conditions affecting women's work.

Their hours of work should be shortened; their efficiency increased by training and better organization; their wages correspondingly increased and standardized; their employment adjusted to the physiological needs of women; the supply of labor adjusted to the demands by employment exchanges, intelligently planned and conducted; co-operative arrangements effected for securing proper care for children, chronic invalids or aged persons in the mother's temporary absence, so that a woman capable of doing more productive work shall not be debarred from undertaking it by less important demands.

These reforms are not in the least inconsistent with the superior claims of

home and children when they are superior, but they are in the direction of enabling working women to decide for themselves, as working men decide for themselves, in what way they can most economically and most completely meet their natural obligations. Industrial justice clearly involves such changes in public opinion, such protection and enlargement of opportunity, as have been suggested.

Difficulties arise and hardships occur primarily because women are not trained for skilled occupations, are worn out by long hours and injurious occupations, and are paid far less than a living wage. Relief to the individual victims of industry cannot change industry. The only cure for industrial abuses is industrial betterment; and the state should spend its money in industrial betterment if that is necessary rather than establish a system of relief to meet the exigencies of a situation which must give way with the coming of reforms that are needed and needed now.

Results of the Inquiry

The main results of this inquiry may be recapitulated as follows:

That of all the factors involved in the support of widows and the care of their children, the main responsibility is upon the widows themselves; that they are entitled to the credit for the greater part of whatever has been accomplished in the families studied; and that all measures intended for their benefit should be judged primarily from the standpoint of their probable effect on the ability of the widows to solve their own problems and those of their children;

That widows are usually capable of supporting themselves and their children when necessary, but that in doing so they encounter great obstacles and hardships, which can be removed only by radical changes in the conditions of women's work;

That the occupations in which widows who apply for relief are engaged are characterized by inefficiency of workers, low wages, and irregularity of employment;

That these evils can be met only by early training, a better distribution of workers through efficient employment

exchanges, and higher standards of compensation;

That vocational training and guidance for children as they come of working age, and sound advice as to occupations, are urgently needed;

That more hospital and sanatorium facilities are required for the sick, the disabled, the infirm, the convalescent, and the mentally deficient, facilities both for diagnosis and for treatment;

That although great improvements have been made in the standards, methods, and policies of the charitable societies, there is much room for further improvement;

That, in particular, more trained workers, with higher salaries, or more trained volunteer workers, or both, and larger resources for relief, are indispensable for the preservation of the health and well being of the families now under the care of the societies;

That the case records of the charitable societies indicate that conditions in the families under care do not always improve, but sometimes grow worse, these unsatisfactory results being due partly to the causes just named, but in large part to personal and social causes which neither public relief nor voluntary charity can reach; but upon which those who have to do with the relief of the poor should constantly insist;

That mothers who are suitable guardians for their children, physically and morally able to care for them properly, are not seeking in any large number because of poverty alone to have their children committed as public charges;

That the charitable societies have shown both the desire and the financial ability to provide relief in such cases when called to their attention, although in these as in other cases the relief is sometimes inadequate;

That there should however be a still better co-ordination between the bureaus of dependent children and the voluntary agencies to prevent the relatively few unnecessary commitments of this kind which still occur;

That the ideal solution of the widows' problem is a longer and more productive life for working fathers, and provision for widowhood and orphanage through a liberal, inexpensive, and safe system of social insurance.

"BEAUTY FOR ASHES"

Sixth Article

The Poor and Their Poverty

THIS chapter is not about those of whose "short and simple annals" Gray wrote. It is not of those to whose "honest poverty" Burns referred. Nor does it treat of any who can sing, "Be it ever so humble." All of these may have been poor, but they were not "The Poor." There is fresh air blowing through every one of those poems. They breathe of all that is wholesome, tender, sacred, the real riches of life.

But one cannot write a pastoral poem about the poor. There is no song of the lark over their heads, to weave into the verse, no "lowing herds," no fireside circle, with its "peace of heart." Instead, there is the Wolf outside the door, howling to the dark. And those who hide and cower inside are the ones we call "the submerged," the Children of the Shadow. For the most part, in our country, they are the children of the city and the town.

Distance, perspective, "chiaro-oscuro," may be to blame, rather than our eyes, that we see the poor as a mass of shadow, painted in one flat gray wash, at the remote edges of our sunshine. In fact, they are generally spoken of in that way, as if that one drab word named, defined and classified all who were over the line, on the shadow side. And there is so often reproach in the word, and abhorrence in the tone with which it is spoken, that I am fain to plead for them a better acquaintance and a fairer judgment. That is why I am writing this chapter, to bring the poor nearer, as with a sort of field glass, to those who have never really known them.

It cannot be gainsaid that the majority of people in any city know nothing about the poor. I have found by investigations in many cities and towns that, outside of a limited circle of charitable people, and a number of ministers, doctors and policemen, no one could give any trustworthy information about the number or condition of the poor. While there may even be large societies with many committees, whose members give much time to planning charity work (much of which must consist in raising funds) and while these members even "bestow their goods to feed the poor," so often the actual visiting of the poor is done by the secretary, and a few committee members.

The same is true of the churches, where only a limited percentage of those

PITY

By A. Cordonnier, Musée de Luxembourg, Paris

THE WRECK¹

We found a wreck cast up on the shore,
Battered and bruised, and scarred and rent,
And I spoke aloud, "Here was worthless work,
And a barque unfit to the sea was sent."

But he said, my friend, in his gentler mood,
"Nay, none may say but the work was good,
For who can tell of the seas it sailed,
Of the waves it braved, and the storms withstood?"

Then we spoke no more, but I mutely mused,
And I thought, "Oh, heart and oh, life of man,
That we find wrecked, we may never know
How brave you were when your course began!"

who give ever get inside of the homes of the poor. By those who go the tale is brought back to the meeting, and passed on, second-hand and so on; so that "the quality of mercy" is "strained," through a great many sieves. The smell, the dirt, the misery, are mostly filtered out through the first medium through which the tale passes, and the colorless, sterilized material which flows on cannot make any one feel badly enough to be a missionary.

It is noticeable that we can bear with great philosophy the sufferings of others, especially if we do not actually see them. But, to be truly and consistently charitable, we must believe that those who speak most harshly of the poor are like the little girl who could not be cured of biting other children until some one bit her. Up to that time she had no idea that it really hurt. It is those who have never been bitten by the things that hurt the poor who criticize them. One of those who "stood afar off" sat by me one day, at an elegant luncheon, and divided her time between polite inquiries about my work, and impolite remarks about the poor. After worming out of me what the tenement law would give to the latter, in the way of water, plumbing, etc., she expressed herself strongly as to the waste of such things on the poor, who were "filthy," and "would put coal or vegetables in the bath tubs," who "didn't appreciate anything done for them," were "destructive to property," etc.

"But the law *doesn't* give them bath tubs," I tried to say, with no chance to enlarge on the fitness of providing them for those who were "filthy." When her tirade abated I ventured,

"May I ask whether you have gone much among the poor?" "Oh, mercy, no," she answered, in a tone of horror and disgust. "I couldn't bear to mix with that kind of creatures."

And then I couldn't refrain, "I judged so, for I never heard any one speak of them that way, who really knew them."

"Why do you spend your time and strength for that kind of trash?" a friend asked me. "If they were deserving, or appreciate what you do, even, it wouldn't be so bad."

Even those who work among them often fail to measure them by fair standards. "You can't believe anything one of them says," complained a girl who taught a mission class. If we must make people see that it is those who are sick, and not the well, who need a physician, may we not also call in an optician? "The poor are so miserable, and they make every one about them so miserable, isn't it a pity they can't all die off, like flies, in the winter?"

The girl who asked that, in unsmiling jest, was working then to the point of exhaustion, out of sympathy for the poor. The protest I want to make is against the two commonest but greatest errors.

One is, the unfairness of speaking of the poor, in one contemptuous breath, as if they were all of one class, and all degraded. The other is, the assumption that the poor have peculiar faults and vices which make them odious, and differentiate them from all the rest of society.

For the first, let me say, that when we come close enough to the Shadow so that we can distinguish tones and values,

THE RIGHT BACKGROUND FOR THE FEEBLE-MINDEDNESS AND TUBERCULOSIS IN THIS FAMILY

MAKING A BACKYARD GARDEN UNDER DIFFICULTIES

we see that there are different types and groups, and that some are plunged much deeper than others. Then we notice individuals standing out clearly, and we are struck by the marks of their unlikeness to the rest, as if they belonged to a higher plane. There are so many among them who have been well born, well educated, reared in comfort, often in luxury. Some have but lately fallen, and are still dazed by the shock. Having lost only fortune, and retaining still their habits of culture, they are no more of the underworld than the spirit of Dante was of the Inferno. In a study of poverty there is little more to say of them than could be said of any victim of a wreck or explosion. But in a study of the poor our first care must be to save these victims from the common scorn, and to ask for them the sympathy that is their due.

Survivors from "Better Days"

Even more pitiful are those who have come, by a slow and hard descent from wealth to want. Decay is sadder than wreckage. "A decayed gentlewoman" is a product of pinched, painful years. We have found, in our slums, some old couples, once prosperous and happy, who had gradually lost all they had, and were now fighting, with their last feeble effort, against going to the alms-house,

and had planned suicide together if the last resort failed.

In stifling garrets, in dark tenements of our cities, are hidden away many tragedies, as sad as any Dickens ever wrote, that will remain sealed until the Day of Judgment unless some friendly hand unclasp the volume. When the story ends with the death of the aged, the end is a happy event. But if there be a sequel through succeeding generations, it may grow more and more tragic. The outcome of the story will depend largely upon where the scene is laid. In other words, the matter of environment will be an enormous factor in the rise or decline of the family.

All the way down, through lessening degrees of original culture and wealth, to the very lowest strata, we find people who have been thrown under by a sudden turn of the wheel of fortune. Many of them can be helped on to their feet once more. Many are so broken in health or in spirit that they will never rise again.

One can tell, by a certain air, or frost in the air, those who have "seen better days." Often there will be some heirloom left, some picture, or a piece of furniture that tells the tale. The next generation may still retain the furniture, and a trace of the culture, like the worn gilding on a tarnished mirror, but if

the children stay in the slums, they will be of a different type.

A woman of the second generation of slum dwellers, and of common-place origin, came once to iron for me. There was a thrifty strain in her, from some antecedent, that made a puzzling mixture with her "poor-folksy" air. Thinking to encourage her, I praised her ironing.

"Yes," she said, airily, "I think I do arn pretty well, considerin' I haint arned fer so long. We used to hev a' arn, but now it's gone."

"How do you manage"? I asked, quite puzzled.

"W'y, we jest fold th' clo'es, an' put 'em in th' trunk. But I *do* think they look better arned," she added.

The next generation will probably wear their clothes both unwashed and unironed.

The Next Generation

One of the points I want to emphasize is that several generations of slum environment will produce a slum heredity, and the children will have that to contend with, as well as the slum environment. In our slums are girls who never saw a room properly cleaned, or ate a meal properly cooked, and neither did their mothers or their grandmothers. There was "nothing to do with," of course. They had no proper utensils or materials. There may have been wealth, even nobility, away back in that family, but it "buttered no parsnips," and provided no soap. The use of the right forks comes only by using forks. No matter how many Greek professors grace one's ancestry, or how many clergymen bless

A CLOSING SCENE IN THE TRAGEDY

it, the descendant will lisp in Billingsgate, if he hears nothing else.

The daily lesson of slum life, visualized, reiterated, of low standards, vile living, obscenity, profanity, impurity, is bound to be dwarfing and debasing to the children who are in the midst of it. Even in the second generation these influences are blackening and corroding enough to destroy the faint impression of "where mother used to live," and "what father used to do." By the third generation, even that background is lacking.

I cannot enlarge upon the deterioration of families, through successive generations of slum life, without considering the effect of the sub-normal environment upon the normal family, in the case of our working classes. And this makes me boil over again.

The outrage of our American cities is the way we bid for home-seekers, when we have no homes to offer them, after we lure them to come. Our factories scour the country for workers, bring them in, and turn them loose, to find shelter wherever they can. Our business organizations offer bonuses for new factories, bidding for these which bring in the largest number of families. "Another factory! 100 families! More prosperity!" they announce, in big headlines.

And the families? As lightly as a chemist pours drugs from one vial into another, these human beings are transferred from one environment to another. The fact that a city has not already enough decent houses for all its population, and that its poor are living in sties, causes no one any concern. When the workmen come with their families, many of them have to crowd into filthy, unsanitary tenements with the poor, and subject their children to the companion-

CITIZENS-IN-MAKING, OR GANGSTERS-ELECT?

ship of the vicious and degraded. The fact that the working-man could afford more rent, and would gladly pay more for a better house, makes no difference. His family must have shelter. He shelters them where he can.

"The workmen have all found homes," we are told.

"Homes"? Where?

One of the saddest sights of the slums is to see the thrifty wife of the working man, with her rosy brood of children, used to country air and sunshine, used to space, privacy, good surroundings, cleanliness, quiet, shut up amid the noise and dirt and confusion, in the gloom of the slum. That is an unusual family that can maintain the sanctity of its home life, in the tenements of a bad neighborhood, where there is no privacy, that can hold the children under strict discipline,

if they are too large to shut inside the rooms, and must go to school or to work. If the father be not drawn to the saloon, and the boys and girls to the street, they must be both Spartan and Puritan. The brave fight may be made if the father and mother are spared, to hold control, and provide the bread. But how many working men in our cities, the records show, fall a prey to tuberculosis, typhoid, pneumonia, and other "house diseases!" How many mothers are beckoned from their little families by the same ghastly finger! Any one who will search the records will find that a startling number of dependent families become so on account of death or prolonged illness of the bread-winner.

And the children?

The ranks of the dependent and delinquent are recruited—in what percent-

age we ought to know, but any percentage is too large—from the families of the working-men that are brought into our cities and dumped into our dilapidated old death-traps.

And so I say that the responsibility is upon those who import working-men to see that there are decent homes for them when they come, and not to set snares to destroy them and their children.

When we come to consider the lowest strata of the poor, we find defectives, degenerates and their brothers, those who feed our institutions over which the state has care, and who are in turn recruited by the classes just above, as well as by their own offspring. It is these who give to all the poor the stigma of being "filthy," "shiftless," and all the other odious epithets. Here, "at the bottom," we find we are dealing with quan-

ties less variable. We often say that riches and poverty are only comparative. In its lowest deeps poverty is almost absolute.

"He that is low need fear no fall." How much less need he fear who is already on the ground, except to fall into a pit? Sickness, injury, accident, are the pits the poor dread, and well they may, as our Nurse's Circle found. Now I am reminded that the poor have their own pleasures and enjoyments, and I know that many funny stories are written about certain types. But these are the child-like, irresponsible ones, with natures of cork, who have never grown up, and never will. They can lock the Wolf in the closet, with the Skeleton, for the day, any time, and, following the hurdy-gurdy whither it whines, set off for a merry vagabondage. It is true, there are always humorous things coming up in the discussion of charity cases, odd mistakes and droll conversations. But, thinking them over, with their setting, one finds that they are much like the relief scenes in Macbeth.

The Faults of the Poor

Whatever any one may say of the lowest types of the poor, I hold that all of the faults ascribed to them are due to their being either undeveloped or defective, and the worse the fault the more defectiveness it shows. This is my one plea for those who cannot employ their own advocate, and who need one most. The bold and bad can make their own defence. The sharp and shrewd may find their own excuses. But for these, who are always absent when they are maligned, let this plea prevail.

It hurts me to hear the tone in which the poor are condemned, as "shiftless," or "having a pauper spirit," just as it would if a crowd mocked at a child for its weakness, or laughed at a lame man because he could not run, or a blind man because he stumbled.

The poor are lame, maimed, halt, blind, in a way. They may not be defective enough to admit them to an asylum, but they are too defective, mentally and physically, to keep up in the race. They cannot see as we do, and have inhibitions that hold them back even from the good they see.

"Lazy"! Some of them are "born tired," and enter into life without their share of vigor or vitality. Some of their mothers were overworked and under-nourished, perhaps scrofulous. Some of them, themselves, are over-worked and under-fed, or have lost their efficiency through illness or exposure. And they breathe poisonous air, sleeping in unventilated quarters, six or twelve in a room. They drink sewage-poisoned water, that makes people lethargic and dull.

As to the poor—many, not all of them

"CHUMS"

—being "filthy," we must admit the fact, but we insist on the reason. As to their "preferring to be filthy," I have said enough in other chapters of the heroic efforts some of them make to be clean. I wonder, as I see them carrying water so far, and up and down stairs, how they have the heart to do it. I wonder how many of us would try as hard to be clean. One marvels at the persistence of the conception of purity, in our slums, and marvels, too, that the seven plagues have not swept the poor, and us along with them, off the earth.

The Virtues of the Poor

It is so easy to account for the faults of the poor. It is their virtues that are unaccountable. We find many cases of heroism, in their struggle against desperate odds. The generosity of the poor is proverbial, and seems to be in inverse proportion to their possessions. It is a common thing to find a family giving up one of their rooms to another family. We knew of a family in two rooms giving one to a woman who was dying with tuberculosis. It is not unusual for one or more waifs to be taken into a family, even though the meagre supply of food and clothing is already insufficient.

A most remarkable case was that of a woman who adopted the deformed idiot boy I spoke of seeing on my first round of the slums. He died some months ago, and we heard then the strange story of his life. His mother died when he was a little child and he was adopted by a friend of hers who was no relation, or, at least, only the half aunt of his step father. The boy grew to be a terrible burden, being large and heavy, and unable to walk, or to do anything for himself, and had to be cared for and wheeled about like a baby, even in his teens. Yet the woman clung to him, and gave him the most devoted care, refusing to go to her family, with marvelous self-denial. By the time he died she was a physical wreck, completely worn out.

As I write these things there comes over me again that feeling that always overwhelms me when I look out upon an

audience, of well-dressed, well-fed, well-housed people, and note the sheen of silk and the glisten of jewels. How can we put the story of Poverty's Children into the vocabulary of these Children of the Sunshine? How can we explain to those who have to diet, as a penalty for high living, or who have to take tonics to create an appetite, what real hunger means? So with fears and anxieties, and all the rest of the troubles of the poor.

The Fears of the Poor

The same words do not mean the same thing to them and to us. "Safety"—that is a thing we rarely think of, except when we travel. In our homes we tuck our children into soft white beds, bolt doors and windows, and with a comfortable thought in the background of Providence, our good man, and the police, sleep with no thought of fear.

I know of mothers who have to lock their little children into their tenement rooms when they go to work for the day. Others have told me that they have to hurry home, after washing, for fear their little girls will get home first, from school, in terror lest they fall into the hands of one of the low drunken lodgers in the place. There are mothers who tremble when an ambulance or a patrol wagon rumbles by, and who hide their little ones under the ragged coverlet when the noise of heavy feet on the stair tells that a carousal is over or a fight is on. And if the daughter steals in later, off the street, they are thankful that she comes in at all.

"But the lowest types, not having our sensibilities, cannot suffer so keenly," people say.

If they have not our refined anguish, neither have they our higher consolations. Superstition shadows the poor with countless fears, as we find at every turn. Some writers dwell strongly on the paralyzing terror of want, the fear that the Wolf will actually end them. Do they fear it so, those half brothers of Romulus, who have known only that same shaggy foster mother? Or do they think of her as Hood's seamstress thought of Death—"I hardly fear his terrible shape, it seems so like my own." The higher types do show this fear, with an equal dread of the almshouse. The thought of a pauper burial preys upon them too. Some of them will take us to a little battered trunk, and show us, folded away, the clean sheets, the coarse shroud, and the small sum of money, saved, though they starve, so they "can be put away right."

The question of "sensibilities" is made so much of that one would be led to believe, almost, that the question of the shabbiness of the poor was a question of poor taste, and not of a poor purse. "Pore folks has pore ways," of necessity. But the discussion of the ragged children over the dress in the shop window was

TWO NEVER-FAILING SLUM HARVESTS

significant. "If it's pretty, it costs, and if it costs, we caint git it."

Our Flower Mission girls had many tales to tell of the craving of the poor for beauty, for finer things, often for higher things. One of them made a conquest of a group of girls in a tenement neighborhood. Their admiration reached the point of wanting to copy her dress, her hat, and her coiffure, and she actually took down her beautiful hair to show them how she arranged it.

Girls who live in the dismal slum and work in the dingy factory, going to and fro past the brilliant shops, seem to have a special hunger for the bright pretty things they cannot afford. Some feed their souls on beads, cheap lace and pathetic millinery, as inadequately as they do their bodies on "sodies" or popcorn balls. Many of them acquire remarkable taste, and develop a desire to be "stylish," trying to keep as close as possible to the heels of fashion, which, with their limited means, often makes them as grotesque as our actual shadows.

A girl who was shivering, coatless, in a freezing wind, thankfully received a good and comfortable wrap. She put it on joyfully, then looked it up and down with an expression of uncertainty. "Is it in style?" she asked anxiously.

The installment store man knows full well of the craving of the slum dwellers for brightness and beauty. He sends shiny things and rugs of glowing colors to their doors, and they cannot resist them, any more than they could resist holding out cold hands to a fire. Having no idea of value or economy, they take these articles, at enormous prices, perhaps to lose both the coveted treas-

ure and their money, when they fail to make payments. But we can't blame them. If I had to live in one of those gruesome holes I would go without bread for a red rug.

The Pauper Spirit

While I am answering for the poor, let me speak of the "pauper spirit." It is the spirit that the skillful worker tries to supplant by pride and independence, but unless there has once been a spark, it is hard to start a flame. And why should one have pride, when he has nothing to be proud of?

"My grandfather was a squire," a poor woman said proudly, and at the word all her ragged children held their heads a little higher. We knew that they might go bare, but they would never beg. But those who have had no grandfather, or, sadder still, no father, should not have so much expected of them.

The pauper spirit, when exhibited by shrewd people, of a higher type, is quite a different spirit from that of the born pauper.

"I can't think of asking charity," said a woman who had been "working" many of our generous citizens, "so I came to ask your help. You have influence and affluence, and I need your aid." Those were her actual words.

Another appeal, by letter, from a distant town, expressed confidence in my generous and noble heart (as per some newspaper account) and, explaining the needs of the young lady of the house, asked for a set of parlor furniture. Every one in public life receives such appeals from unknown people.

With those who are really helpless,

weak and ignorant, the pauper spirit seems to be a touching confidence in a higher power. "If the people that 'tends to things could see the awful place I live in, they'd surely do something about it," said one old woman who came to ask for help with her rent.

"The pauper spirit"—what is it, in such as these, but the spirit in which the child cries for food, the spirit in which we make most of our prayers, those that are not communion or thanksgiving, but simply appeals for material blessings?

We all agree that, if any trait belongs exclusively to the poor, it should be this one. Yet we find it in all walks of life. What traits can be found, then, that mark only the poor?

If we try by elimination to discover their peculiar faults and vices, we find none that are not shared by some members of the wealthy and middle class. Going over the catalogue of their reproaches, we cannot find any that can even be applied to all the poor. "Lazy, shiftless, improvident, spendthrift, intemperate, lacking in honor, in honesty," these do not differentiate the poor, even those to whom these epithets apply; they only show their fellowship with the weak and low of other classes.

After all, nothing seems completely to differentiate the poor but poverty. We find no adjectives to fit them, as a whole, only those of which Want is the mother. "Miserable" covers many; "shabby," most, and I am sadly aware that in a large majority of minds, "disagreeable" includes them all.

Shadows, they are, indeed; not remote, as we may think of them, but here, at our side, at our back, flitting across our path, weaving about us the dark web of their own misfortunes.

But because we are ignorant about the poor, we need not assume that they know as little about us.

The Field Glass Reversed

It is surprising, sometimes, what close track they keep of us. In one of our largest tenements I found one day an old retainer of my mother's, who used to wash my tiny frocks, and had been a valued servant in the days of her strength. We had lost sight of her, and it was a shock to find her here. She was as delighted to see me as if I were kin, and asked about each member of the connection, commenting upon their recent doings with so much accuracy that I was amazed. "How do you keep track of them all?" I asked, knowing she never saw them. "Oh, we take a newspaper here, and read about all of you," she answered. I found that all the tenants contributed to the subscription for one paper, which was passed about from hand to hand until it was worn out. It gave me a new sensation, that of turning the field glass the other way.

How do we look to them?

THE gunmen's tools were poor instruments to unravel a desperate tangle of the underworld. Mr. Lane (page 13) makes us want to cast the electric chair into the same junk-heap; makes us question a scheme of criminal law which ends in a mechanical invention to destroy when it should begin with a social invention to save,—and build on that.

“THEIR effortful lives represent the most difficult and painful phase of woman's adjustment of age-long activities to conditions in the present world of wages.” So concludes Miss Anthony's study of the Mothers Who Must Earn, a transcript of life which goes on beneath the familiar superstructures of gentle living and garish delight, of political struggle and of racking business endeavor. The accompanying article by Mr. Devine reviews the work of relief by six charitable societies of New York among such families. There is stirring challenge in his presentment; and today the public is readier to listen than ten years ago when the late Emil Münsterberg, head of Berlin's Department of Public Charities, explored American poverty and told us that we, no less than the old world, needed to put imagination and treasure into relief, beyond what was as yet turned into it in any city or any country.

A reading of these articles, in conjunction with the findings (p. 23) of public and private inquiries in New York into the problem of widows' pensions, shows, however, how far the situation transcends the shortcomings of voluntary relief agencies or the promise held out by state aid. We need to carry to new and higher levels our schemes of public and private help for stricken families in which there are little children; but back of their household problems, enmeshing them along with unnumbered other households likewise dependent on the deficit earnings of men and women, lies a labor problem beside which Calumet is a cradle of hope, and this season of unemployment a passing ill.

New York has prohibited cellar dwellings; but life and labor are acquiesced in at subnormal economic levels which can only be compared to sinking our tenements six stories underground. Every probation officer, district agent, and visiting nurse could add to Miss Anthony's testimony and Mr. Devine's grave characterizations. Yet we haven't driven home the community's responsibility as we do when a great corporation exploits its men. We haven't visualized this evil as

we have housing reform. We have not set it off as a thing to fight as we have set off tuberculosis.

THE new Perkins Institution (page 7) is a culmination of that mighty movement of the last century which set out to break down the barriers of physical handicap and open the way to fullness of life to blind and deaf and mute. Its beauty and resourcefulness typify the achievements of the exceptional blind; and well may Perkins stand as their Oxford—a high training-school to carry the heritage of the sightless to its uttermost.

But, shall we therefore urge every other city and state to build along equivalent lines? Back of the miracle of a sightless violinist lies the prose struggle of a hundred unmusical, unexceptional, unseeing folk. Better, rather, a hundred Hamp-ton for the blind in the new world.

The special enrichment in art and culture and music of all institutions for the sightless goes without saying. They should make amends for the lost appeal of the eye and stir the rare spiritual growth of the unseeing. But in these days of the vocational movement for seeing children in our schools we may well look for its counterpart for the unseeing. The occupations and environment which will mean normal household life and livelihood for blind boys and girls in the world they are to enter, should begin in their years of growth.

Might not Perkins itself come to bear a post-graduate relation to such centers of more everyday training?

CHILD LABOR AND INTERSTATE COMMERCE¹

WILLIAM DRAPER LEWIS
Dean of the University of Pennsylvania Law School

THE national child labor bill introduced by Mr. Palmer last January which has been referred to the Committee on Labor of the House, and also the national child labor bill introduced by Mr. Copley last July, which is before the Committee on Interstate and Foreign Commerce, and which has the endorsement of the caucus of the members of the Progressive Party, are based on the proposition that Congress has the right to exclude from interstate commerce the products of a manufacturing or other establishment where conditions destructive of the health or morals of the

¹Substance of an Argument before the Committee on Labor of the House of Representatives, March 9, in support of the constitutionality of a national child labor bill.

employees are allowed to exist. The soundness of this proposition can hardly be seriously questioned in the light of the decisions of the Supreme Court of the United States.

There are two views of the power of Congress over interstate and foreign commerce. One was enunciated by Marshall in *Gibbons vs. Ogden* (9 Wheat., 196-197). In Marshall's opinion the power of Congress over interstate commerce is just as absolute as the power of the states over intrastate commerce, although it cannot, any more than any other power of Congress, be so exercised as to violate any of the constitutional restrictions on the federal power.

"The power over commerce," he declares, "like all others vested in Congress, is complete in itself, may be exercised to its utmost extent, and acknowledges no limitations, other than are prescribed in the constitution." And, he adds:

"These limitations are expressed in plain terms. . . . If, as has always been understood, the sovereignty of Congress, though limited to specific objects, is plenary as to those objects, the power over commerce with foreign nations and among the several states, is vested in Congress as absolutely as it would be in a single government, having in its constitution the same restrictions on the exercise of the power as are found in the Constitution of the United States."

The theory thus clearly stated by the great chief justice can be illustrated in this way. Suppose Congress passes a bill prohibiting interstate commerce in a certain article. Such an act would be a regulation of commerce. The plenary power of a sovereign to regulate includes the right of absolute prohibition. The question of the constitutionality of such an act, therefore, depends on the answer, not to the question, "Is it a regulation of commerce?" but to the question, "Does the act violate a constitutional limitation?"

There are only two limitations which may restrict the exercise of the power of Congress to exclude an article from interstate commerce. The fifth amendment provides that "No person shall . . . be deprived of life, liberty, or property without due process of law." It can at least be argued,—with what force it is not necessary here to decide,—that an act of Congress which prohibited traffic in an article without expressed or apparent reason, would deprive owners of their property "without due process." It may also be argued that the ninth amendment, by providing that "the enumeration in the Constitution of certain rights shall not be construed to deny or disparage others retained by the people," prohibits a purely arbitrary exercise of power by Congress; and that the exclusion without apparent reason of an article from interstate commerce, would be an arbitrary exercise of power."

It should here be pointed out that under Marshall's view, the tenth amendment imposes no restriction on the power of Congress over interstate and foreign commerce. It provides that, "the

powers not delegated to Congress, are reserved to the states." But the power over interstate commerce and foreign commerce is "expressly delegated" to Congress.

THE other view of the power of Congress over commerce is that besides the express limitations contained in the Constitution, Congress is prevented from so exercising the power as indirectly to regulate matters which it cannot regulate directly. It is said that to allow such regulation would defeat the very purpose of the tenth amendment, which reserved to the states the powers not granted to Congress nor prohibited to the states.

Whatever may be said for or against these two views, the view of Marshall is today the view of the Supreme Court. In 1895 Congress passed an act for the suppression of lottery traffic through national and interstate commerce. This act, among other things, makes it an offense to carry a lottery ticket from one state to another. Its constitutionality was attacked and the two views of congressional power just indicated, were presented to the court. The majority, taking the position of Marshall in *Gibbons vs. Ogden*, decided that the act was constitutional. The minority, adopting the second view, thought the act should be declared void.

The Lottery Case (188 U. S. 321) was decided in 1903. Since then the constitutionality of the federal pure food and drugs act and of the white slave act have come before the court. These decisions also depended upon which of these conflicting views the court would adopt. The lottery case was decided by a divided court, but in the later decisions, *Hipolite Egg Company vs. United States* (220 U. S. 45) decided in 1911, supporting the pure food and drugs act, and *Hoke vs. United States* (227 U. S. 308) decided in 1912, supporting the white slave act, Marshall's view was followed with the concurrence of every member of the court. At the present time, therefore, the members of our highest court apparently believe that in determining whether Congress has the right to prohibit the interstate transportation of a class of persons or products, only the express limitations of the Constitution need be considered. For this reason it seems unnecessary to bring special arguments to the support of this theory. One argument, however, deserves special mention.

A state has the undoubted right to prohibit the manufacture of adulterated food or drugs within its domain; it can also forbid their importation from other states (*Plumley vs. Massachusetts*, 155 U. S. 461, 1894). A state has the right to forbid the sale of lottery tickets, both parties to the sale being within its borders; it could probably prevent their importation under the reasoning in the *Plumley* case. A state has the right to prevent the physical and moral degeneration of children by overwork in manufacturing establishments; but it cannot forbid the article manufactured by child exploitation from being introduced into the state so long as the article itself is unadulterated and safe (*Leisey vs. Hardin*, 135 U. S.

100, 1889; *Schollenberger vs. Pennsylvania*, 171 U. S. 1, 1898).

In other words, while the states can protect their manufacturers from the competition of the makers of adulterated foods, they are powerless to exclude the competition of foreign makers who cheapen their product by the exploitation of child labor. Should Congress lend its aid to the states which protect their child resources, it would therefore be helping them in a field in which they cannot help themselves; whereas in the food and drugs act, Congress enacted federal legislation, not because it was the only protection open to the state, but because it was doubtless the best protection possible.

IT would indeed be a serious indictment against the wisdom of the framers of our Constitution to say that they took away from the states the right to protect their own manufacturers from unfair trade practices carried on by competitors in other states, and yet failed to give Congress the power thus taken from the states. For it is unfair competition for a manufacturer to exploit child labor to lessen the cost of production when his competitor in another state is either forbidden by law or unwilling to stoop to such practices. Fortunately the framers of the Constitution did not so limit the power of Congress. They have conferred on Congress all the power over interstate and foreign commerce taken from the states. What better exercise of the right of regulation thus conferred could there be than the protection of those engaged in industry from unfair competition?

I have heard the argument that a law prohibiting the products of exploited, or what we may also call anti-social child labor from interstate commerce, interferes with the rights of the states, in that it indirectly compels employers of labor to conform to the minimum standards of the congressional act or go out of business. Admit that this proposed act would compel practically all employers of labor to conform to its standards. Is it not better to do this than to have those states which wish to pass laws to protect their children practically forced to do so at the expense of sub-

jecting their manufacturers to the unfair competition of the manufacturers in those states which permit the industrial exploitation of their children?

As stated, however, the argument is a work of supererogation, the question of the power of Congress has already been practically determined by the decisions of the Supreme Court. It has, indeed, been argued that there is a difference between an act which excludes the product of exploited child labor from interstate commerce, and one that excludes lottery tickets, poisonous drugs, or adulterated foods; that these last are not legitimate articles of commerce, while the products of exploited child labor are nevertheless legitimate articles of commerce. To those who make this argument the following quotation from the opinion of the Supreme Court in *Hoke vs. United States* (227 U. S. 308, p. 320), the case supporting the white slave act, is significant. The court, speaking of the power to regulate commerce, says:

"The power is direct; there is no word of limitation in it, and its broad and universal scope has been so often declared as to make repetition unnecessary. And besides, it has so much illustration by cases that it would seem as if there could be no instance of its exercise that does not find an admitted example in some one of them. Experience, however, is the other way, and in almost every instance of the exercise of the power differences are asserted from previous exercise of it and made a ground of attack."

And so in this case. The differences indicated will be pointed out and magnified. But if it is a reasonable exercise of the power to protect the morals or health of the citizens of a state by excluding from interstate commerce lottery tickets, or poisonous drugs we may be sure that the Supreme Court will also hold that it is a reasonable exercise of the power to protect the manufacturers of a state from unfair trade competition, by excluding from interstate commerce the products of those who would undersell by the exploitation of child labor.

TWO CHILDREN

EUNICE JAMES

[Interest attaches to these verses not only from the fact that they were written by a young girl during a day of illness, but that her thirteen brief years of experience of life had all been in a sheltered and well-to-do home. Given a birthday gift of money recently, before she spent any on herself she sent some to a poor woman of whom she had heard people speak, giving away more than half of the present.—Ed.]

DOES the child in the home see the child in the street
Running all day with cold bare feet?
Does the child in the school ever pause in her play
To think of the child in the factory all day?
Do the people so rich ever stop in their leisure
To give five cents for a poor person's pleasure?
Alas, I'm afraid they don't stop to think
Of how closely Christ with the poor did link.

Unseen Forces Behind Your Telephone

THE telephone instrument is a common sight, but it affords no idea of the magnitude of the mechanical equipment by which it is made effective.

To give you some conception of the great number of persons and the enormous quantity of materials required to maintain an always-efficient service, various comparisons are here presented.

The cost of these materials unassembled is only 45% of the cost of constructing the telephone plant.

Poles

enough to build a stockade around California—12,480,000 of them, worth in the lumber yard about \$40,000,000.

Telephones

enough to string around Lake Erie—8,000,000 of them, 5,000,000 Bell-owned, which, with equipment, cost at the factory \$45,000,000.

Wire

to coil around the earth 621 times—15,460,000 miles of it, worth about \$100,000,000, including 260,000 tons of copper, worth \$88,000,000.

Switchboards

in a line would extend thirty-six miles—55,000 of them, which cost, unassembled, \$90,000,000.

Lead and Tin

to load 6,600 coal cars—being 659,960,000 pounds, worth more than \$37,000,000.

Buildings

sufficient to house a city of 150,000—more than a thousand buildings, which, unfurnished, and without land, cost \$44,000,000.

Conduits

to go five times through the earth from pole to pole—225,778,000 feet, worth in the warehouse \$9,000,000.

People

equal in numbers to the entire population of Wyoming—150,000 Bell System employees, not including those of connecting companies.

The poles are set all over this country, and strung with wires and cables; the conduits are buried under the great cities; the telephones are installed in separate homes and offices; the switchboards housed, connected and supplemented with other machinery, and the whole Bell System kept in running order so that each subscriber may talk at any time, anywhere.

MOTHERS WHO MUST EARN

(Continued from page 22.)

indomitable Irish woman, how much she earned. "Now don't faint when I tell ye," she kindly admonished. "I git seven cents an hour!"

The difference between the average wage of part-timers and full-timers amounts to only a little more than one dollar. It might be supposed that the short-day workers are engaged in the better paid occupations—that they are performing some kind of mental labor rather than manual labor and receiving a correspondingly higher reward. But this is not the case. The character of the work done by the short-day and long-day workers is much the same. Both are limited to the occupations open to women without education. We find some of them, for instance, working five hours a day in a restaurant for \$4.50 a week, and others working ten hours a day for \$6.00. Office cleaners working between five and six hours daily earn \$5.00 a week, while scrubwomen in department stores work between eight and nine hours and are paid \$6.00. The explanation does not lie in difference of occupations. The reason seems to be that a premium is placed on regularity and punctuality out of all proportion to the actual amount of labor performed or service rendered. In order to secure the daily presence of the women within certain stated hours, the employer is compelled to pay almost as much as if he wanted them to work the whole day through. He must pay a minimum to insure his system.

UNDER the circumstances, then, why do any of the women cross the eight-hour threshold, when it means only a dollar additional? The answer for most of them lies in the value of the dollar. After all, the difference between a five-dollar and a six-dollar budget is enormous if the mother is the sole wage-earner. If, however, there are other wage-earners in the family, she may save half her time for the home at the sacrifice of one-sixth of her salary.

In families where the mother alone was at work, her average earnings were 88.1 per cent of the average family income; in families where mother and children were at work, her average earnings were 38 per cent of the average family income; in families where both mother and father were at work, her earnings were 31 per cent of the average family income; and in families where the father and children were at work besides the mother, she contributed only 18.8 per cent of the average income.

Her earnings were lowest where the family income was highest. Apparently, the mother works when she must, and when the necessity is less stringent she

relaxes her efforts outside and gives more attention to her home. But to give her attention entirely to her home is a luxury which she cannot afford. If she is to have a home at all, she must bring in money to pay rent and buy food.

We might expect unusual expenses in this particular group of families owing to the mother's absence from home. She might pay someone to help her with the work. But such was not the case. She did her own housework mornings and evenings and on Sundays. The only additional expense that was incurred on account of her going out was the cost of caring for the younger children. The day nursery fee—where a fee is charged—amounts to 5 cents a day. But some day nurseries of the district make no charge. The fee, of course, does not cover the cost of caring for the child in the nursery and is regarded as only a nominal fee by those providing the nurseries. However, it is well to remember that to the woman who is keeping two children in a nursery at a cost of 60 cents a week and who is earning for the same time only \$6.00, the sum is by no means a nominal one.

WITH rare exceptions the women were "keeping up a home." To live in a furnished room is generally regarded on the West Side as reprehensible in a married woman. It is condemned not only as expensive and improvident but also as a hand-to-mouth practice which indicates a tendency to shirk housekeeping and home-making duties. The women who are doggedly engaged in "keeping up a home" for their children by doing the housework and earning the money to support it, take great credit to themselves for their efforts, and well they may.

The typical flat consists of three or four rooms,—a sitting room, a combination kitchen and dining room, and one or two bedrooms. Seldom is more than one room well lighted. Space is at a premium. Folding wire cots, chiffoniers, and drop-leaf tables are popular articles of furniture as they economize space. A sewing machine, bought on the installment plan, is seldom missing. The "grandest" piece of furniture in the flat is perhaps secured with green trading stamps, as the housewife will tell you at the first opportunity. The collection of trading stamps is regarded as a practice of great thrift. The presence of a sewing machine in the majority of the apartments is evidence of the machine agent's industry rather than of the amount of sewing done in the family. Ready-made garments are the rule. Closets are unknown. When the mother comes home from work she hangs her dusty little black hat on the gas jet or deposits it on the mantel. Unless she can afford to buy a wardrobe the children's clothes must hang on the chairs.

Sunshine Tells The Tale

You know how sunlight, streaming through the windows, shows the dust-filled air of a broom-swept room. You know that no matter how thoroughly you sweep and "dust," in a few minutes the flying dust resettles on furniture, floors and fixtures, and floats in the air you breathe.

What a bright contrast is seen in the home "washed with air" by a

Western Electric Sturtevant Vacuum Cleaner

Such a home welcomes sunlight, for all dust and dirt is *drawn out* of each room—banished—by the powerful, steady suction of a miniature strong wind. And the only effort required is to pass the light, handy nozzle over the article or surface to be cleaned. No sweeping. No dusting. No backache. Any near-by electric light socket furnishes the power.

Every home, small or large, can have a Western Electric Cleaner exactly the right size to keep that home "spick-and-span." There are many models, both portable and stationary, priced from \$47.50 to \$400.

Write for our sunlight book, "The Clean Way to Clean." Full of cheer for every housewife. Ask for book No. 15-AZ. It will be sent free.

There is an opportunity for agents to represent us in some unoccupied territories.

Important Volumes of Civic and Sociological Interest

FORTY YEARS OF IT

By Brand Whitlock

Formerly Mayor of Toledo, now Minister
to Belgium.

Cloth \$1.50 net. Postage extra.

Mr. Whitlock's volume is in a sense a history of the progress of democracy in the Middle West. His reminiscences are of such men as Governor Algeld, Tom Johnson, "Golden Rule" Jones. And in the telling of these men, their ideas and ideals and of himself as the continuator of their work, he illuminates that spirit which makes for democracy. Few reminiscences have had the vigor, optimism and personal appeal of Mr. Whitlock's pages.

BEATING BACK

By Al Jennings and Will Irwin

Illustrated with drawings by Charles M. Russell, and with photographs.

\$1.50 net. Postage extra.

For several years Al Jennings headed one of the most desperate gangs of train robbers that ever infested the Southwest. No bandit at any time has been more daring in his wanton defiance of the law than has he. This is the frank, unvarnished account of his life as a train robber, hater of all law and order, his imprisonment and pardon, and the final determination to "beat it back and make good" of the man who is now candidate for the nomination for Governor of Oklahoma.

PSYCHOLOGY IN DAILY LIFE

By Carl Emil Seashore

Professor of Psychology and Dean of the
Graduate School, University of Iowa.

Cloth \$1.50 net. Postage extra.

This is the first volume in the Conduct of the Mind Series. It comprises a clear, non-technical interpretation of the relation of psychology to daily affairs and may well serve as an introduction to the study of psychology. A careful reading of this volume will show a veritable "short cut" to the cultivation of a good memory and will prove a guide to the regulation of our daily life so as to obtain the maximum of physical efficiency. "It may easily become as fascinating as a novel."—*Epworth Herald*.

THE GOVERN- MENT OWNERSHIP OF RAILROADS

By Samuel O. Dunn

Editor of "The Railway Age Gazette," and
author of "The American Transportation Question."

\$1.50 net. Postage extra.

A comprehensive and impartial analysis of the theory of government operation of carriers. The author carefully reviews the results achieved in countries where private management has predominated as well as those countries whose experience with public ownership is enlightening. Rates, service and financial return are discussed. "His book deals with facts. It is well organized, clearly written and well summarized."—*Record-Herald*.

D. APPLETON & COMPANY
35 West 32d Street NEW YORK

THE kitchen, as well as the bedroom, is without storage capacity; a shallow cupboard is built against the wall, but pantries are unknown. Food is bought from day to day, as the average income is so low that supplies can not be bought in quantities; hence the need of a pantry is not so great. Prepared foods are stacked high on the shelves of the small, dingy grocery stores where these women spend their wages. More and more the housewife buys these foods. They save time and fuel,—and fuel is a heavy item.

While the women are doing less and less cooking and sewing in their own homes, they seem to be doing more and more laundry work. One mother of two immaculately clean little daughters was asked how she managed to do it. "I wash and iron every day," she replied. The women who work away from home all day usually spend at least three or four evenings of the week washing and ironing. The clothes are hung over the stove to dry over night, or put on the wash lines attached to the window. A settlement worker who went to live in the neighborhood was much puzzled by the sound of squeaking pulleys late at night until she learned that clothes were then being hung out to dry. Where to put away freshly ironed clothes is a serious problem. Some of the mothers meet this difficulty by leaving the most precious garments unironed until they are about to be worn. The little white dresses for Sunday are washed out and starched early in the week and then stowed away in a small bundle until Saturday or even Sunday morning, when they are ironed while the family waits, so to speak.

FAMILIES are large on the West Side.

It is not uncommon to find six children or more in a flat. But the families of mothers who work are more likely to be below the average size than above it. The more young children a woman has, the more difficult it becomes for her to leave her home and earn outside. Thus her wage-earning activities are automatically limited by the same fact that sometimes makes her need to earn the more acute; that is, by the number of her children.

In the 370 families visited the total number of living children was 1,321, an average of 3.57 per family. Excluding those who were married and a few who had "gone their own ways," there were left in these 370 families, 1,232 children, averaging 3.33 per family.

Eighteen per cent of the children, 221, were below school age. Only 40 of these children were cared for in day nurseries, leaving 181 who were looked after by relatives or neighbors in a haphazard fashion. Only two day nurseries, accommodating but 120 children between them, were found in this district. Only

Women in the Bookbinding Trade

Artificial Flower Makers

By Mary VanKleeck

Two studies of women workers in New York City by the secretary of the Russell Sage Foundation's Committee on Women's Work.

12mo. Price, each, \$1.50

SURVEY ASSOCIATES, Inc.

Publishers for the Russell Sage Foundation
105 EAST 22d STREET, NEW YORK

45 children, or 3.7 per cent, were in institutions. That so small a number of the children had been "put away" is mainly due to the ever lively and active prejudice against institutions on the mother's part. This prejudice, combined with fear and suspicion, furnished indeed the chief spur to their efforts. What were they working for if not to keep the home together?

Most of those who had put their children away were widows with more children than they could possibly support. They had kept at home the younger children, spreading a small income out thin to make it nourish as many as possible, and had put the older ones in institutions. At fourteen, these little hostages return to their homes, and are required to take up duties and responsibilities from which their institutional life has carefully trained them away.

Almost as many children, 41, or 3.3 per cent, were being cared for by relatives as by institutions. An aunt is a very near relative, on the West Side. She takes it for granted that she should help out where her sister's children are in distress. As a matter of fact, she herself is often a hard pressed mother who has trouble making room for the new member of her family but does not question that it is her duty to do so.

THE women have little time for recreation or social life of any kind. They are too tired to go out in the evening or to attend the mothers' clubs at the social centers. Many of the German women belong to lodges, but more for the sake of the sick benefits and insurance than for the sake of the social features. For mothers who must earn, there is indeed no leisure time problem. The long hours of earning are increased by the hours of domestic labor, until no slightest margin for relaxation or change of thought remains. But sociability and companionship are things which the lowest as well as the highest cannot live without, and these women find in the companionship of their fellow workers some compensation for the drudgery.

The problem of health among these women is, perhaps, a problem of poverty rather than of their industrial employment. The statement made in a recent study of the employment of married women in Birmingham that "poverty alone has such an evident pernicious influence on the health of the mother and her offspring that the influence of industrial employment is to a considerable extent masked," is also applicable to this group of women. As we have seen, 70 per cent were engaged in some form of domestic and personal service. The nature of their work, then, was not so

*City of Birmingham, Health Department, Report on Industrial Employment of Married Women and Infantile Mortality, 1910, p. 20.

Want your share of that \$60,000,000 fund?

IF you're a policyholder in any old-line life-insurance company (except one), you've contributed to an annual fund for agency-expense which in 1912 amounted to more than \$60,000,000.

You'll never get your contribution back or any part of it—now; but you need never pay it out again—you can save it—if you will steer clear of life-insurance agents and deal direct with the one non-agency institution in America—the Postal Life Insurance Company.

THE Company's Health Bureau also performs a most important service in health-conservation by issuing timely Health Bulletins for the benefit of its policyholders, and by providing, for those who so desire, one free medical examination each year—a privilege not accorded by any other company.

It will thus be seen that the Postal Life Saves You Money and Safeguards Your Health.

POSTAL LIFE BUILDING

It will be well worth your while to find out just what the Company will do for you on any standard form of policy—whole life, limited-payment life, endowment, joint-life, monthly-income, or child's welfare. For quick action simply write and say:

"Mail full insurance particulars for my age as per advertisement in THE SURVEY of April 4th," and be sure to give

1. Your Full Name.
 2. Your Occupation.
 3. The exact Date of Birth
- The Company will promptly send you (by mail only) figures for your age with the amount of dividends guaranteed; also additional policy dividends now being paid, showing the Postal's low net cost.

No agent will be sent to visit you; the Company does not employ agents. By dealing direct, you get the benefit of the commission other companies pay the agent.

POSTAL LIFE INSURANCE COMPANY

WM. R. MALONE, President
35 Nassau Street, New York

STRONG POSTAL POINTS

- First: Standard policy-reverses, now nearly \$10,000,000. Insurance in force nearly \$50,000,000.
- Second: Old-line legal reserve insurance—not fraternal or assessment.
- Third: Standard policy-provisions, approved by the State Insurance Department.
- Fourth: Operates under strict State requirements and subject to the United States postal authorities.
- Fifth: High medical standards in the selection of risks.
- Sixth: Policyholders' Health Bureau arranges one free medical examination each year, if desired.

The Transactions of the Fourth International Congress on School Hygiene

are now in press. They will be ready for distribution some time during the spring.

Each set consisting of five volumes will contain more than three hundred and fifty papers and over three hundred illustrations bearing upon many phases of school hygiene.

Subscriptions at Six Dollars each for the few remaining sets may be addressed to

JUST PUBLISHED

The American Japanese Problem

By **SIDNEY L. GULICK, D.D., M.A.**, Professor in Doshisha University, Late Lecturer in the Imperial University, Kyoto, Japan. Illustrated. \$1.75 net; postage extra.

This book forms the first and only clear, comprehensive description of the Japanese situation in California, and discusses from every viewpoint the probable and possible effects of the Japanese in this country as immigrants and citizens.

Dr. Gulick is an authority on this subject: an American by birth and education; a resident in Japan for many years; always a careful observer and student of both nations. He offers an argument, splendidly illuminated with the data his long experience and study have put in his hands, for a reasonable, honorable, and satisfactory solution to the difficult problem. His viewpoint is such as to enable him to see both races equally and to weigh both sides evenly. And the value of his book at this moment is very great.

Notes of a Son and Brother

By **HENRY JAMES**. Illustrated. \$2.50 net; postage extra.

This is an account of the early years of William and Henry James and their brothers, with much about their father and their friends. The illustrations are from drawings made by William James in the early part of his career when he was studying to be a painter.

The Ascent of Denali (Mt. McKinley)

By **Hudson Stuck, D.D.**, Archdeacon of the Yukon. With two photographs, a map, and thirty-two illustrations from photographs by the Author. \$1.75 net; postage extra.

The account of the first ascent of Mt. McKinley, the highest mountain on the North American continent, by the leader of the expedition that achieved it.

Plays by Bjørnstjerne Bjørnson

Translated from the Norwegian, with Introductions, by Edwin Björkman. Each with frontispiece. \$1.50 net; postage extra.

Containing, "Love and Geography," "Beyond Human Might," "Laboremus"

The first is a comedy of the most delightfully witty kind; the second, a most profound and moving presentation of spiritual and social problems of to-day; and the third, which turns on the fate of an ultra-modern type of adventuress, is a thrilling drama.

The Influence of the Bible on Civilization

By **ERNEST VON DOBSSCHUTZ, D.D.**, Professor of the New Testament in the University of Halle-Wittenberg. \$1.25 net; postage extra.

This book traces the history of the Bible through the centuries and notes the influences which it exerted upon civilization.

CHARLES SCRIBNER'S SONS, Fifth Ave. at 48th St., NEW YORK

different from that of the hard-working but so-called unemployed mother and housewife. The conditions under which it was done, however, were very different. Compared with the conditions affecting the group of factory women, those affecting the charwoman and other domestic and personal service workers may be considered less exhausting. On the other hand, the most over-burdened housewife is never called upon to scrub floors all night long, or even half the night. Doubtless we shall soon see the necessity of regulating the work of women in hotels and public buildings, so that the health and strength of these women as well as of factory workers may be protected from night work and excessive hours.

WHY are these women wage-earners? How many of them work because they must, and how many for other reasons? It was a primary purpose of this investigation to give the women an opportunity to speak for themselves in answer to these questions.

Practically all of them regarded their work as compulsory and the reasons which they gave as imperative. In some cases they were at work to tide the family over a period of illness of the principal breadwinner. In others, a season of unemployment for him had sent the woman out to hunt for a job. A common assertion was that "a woman can get work when a man can't, because she'll work for less." While they are willing to work for miserable sums themselves, they usually justify their men who make a stand for decent wages. They may be bitter and resentful against the husband or son who loafs or drinks, but they are patient with his insistence on his price if they feel convinced that this is the trouble.

None of the women expressed a direct preference for outside work over housework. They were, however, little inclined to complain of their hard lives and the hard conditions of their employment. Only in cases where the mother knew that her children were definitely suffering by her absence was keen resentment felt.

A peculiarly haunting complaint was one which came from a silk-worker in a Forty-first street factory. From her place at the warping-frame she could look down into the street, and daily between 10 a. m. and 12 noon she saw a well-dressed woman walking up and down with her dog. It was a sight which never failed to arouse in her bitter and envious thoughts. "It would make me think of my Georgie shut up in the day nursery and me in the factory all day long."

The foregoing study has only one thesis. The wage-earning mothers composing this group worked because they were forced to do so. They had been driven into work outside the home by

conditions of poverty. They had become wage-earners in obedience to the most primitive of maternal instincts. Their children would have suffered seriously had they failed to earn.

WE have observed that the earnings of the mothers furnished a considerable percentage of the total family resources. Small as are the wages of their unskilled occupations, the amount plays an important part in a family budget correspondingly small. A clear recognition of this fact must lie at the basis of all attempts to improve by legal and social programs the condition of such mothers.

We have already begun in this country the experiment of protecting motherhood by legislation. The existing laws fall into two groups. Those which affect the mother at childbirth have so far been passed by only two states: Massachusetts and New York. Into the second group fall the mothers' pension laws which have recently been enacted in a number of states and are now being considered by others. Certain practical features of the experiment may receive some illumination from the conditions prevailing among our group.

Of the 370 West Side women, 44 per cent had husbands at work. Forty-two per cent of the 125 widows had worked during their married life prior to the death of their husbands. Some states have established pension systems which permit only widowed mothers to be eligible for grants. If the domestic condition of the group studied here is at all significant of the whole class of necessitous mothers, the restriction of the allowance to widows manifestly falls far short of the need.

Another feature of the tentative laws is the tendency to stipulate that the mother shall forego all industrial employment and devote her full time to her home. But it must not be assumed that the middle-aged mother is entirely without earning capacity, or that the pension so granted is clear gain from her point of view. Hence, any ruling which requires this class of mothers to forego all income from their own earnings would be ineffective, unless the aid given were fully adequate.

THERE was one inevitable conclusion which resulted from our analysis of conditions in these 370 homes. It was, that not one of these mothers could afford not to earn. This compulsion to earn which the West Side mothers felt and obeyed is a far-reaching and significant one. Their effortful lives represent the most difficult and painful phase of woman's adjustment of age-long activities to conditions in the present world of wages.

Announcement

Publication of the
SECOND EDITION
of the
New International Encyclopædia

A new edition of the New International Encyclopædia, to be known as a *Second Edition*, is now in course of preparation, the first volumes of which will be ready for delivery to the public

ON OR ABOUT APRIL 15th.

A Complete New Revision

of the entire work—entirely reset from new type and the only encyclopædia that is up-to-date. The same careful method of editing that has made the first edition the standard of authority throughout this country.

Contents

The *New Edition* will consist of 22 volumes of matter and an additional volume of "Courses of Reading and Study," covering about 18,000 pages, with over 1,000 separate maps (in colors) of cities, states and countries, and full-page engravings illustrating the text; many of these in colors, the result of ten or more separate printings.

Thin Paper

It will be printed on "University Bible Paper" manufactured especially for this edition. The volumes will be about one inch thick and weigh less than three pounds.

Comprehensiveness

The work will contain over 70,000 distinct articles, among which are many not to be found in any other *Encyclopædia*, due in part to the fact that the

Lateness of the Work

makes possible the insertion of many new topics, and second, because of the great comprehensiveness of the work.

Dictionary Topics will be excluded except where a dictionary term may be considered a pure encyclopædic subject.

International, yet American

The work will be broadly international in its number and treatment of subjects, but thoroughly American in its viewpoint of these subjects.

Standard Authority

The first edition of the New International Encyclopædia is the standard authority in practically every important public library and educational institution in this country. We have no hesitation, therefore, in referring the general public to the librarians of these institutions for information as to its superiority.

Its Practical Value

Of the first edition, The American Library Association, (A. L. A.) says: "This is the best Encyclopædia for ready reference."

Of the first edition more sets have been sold than of any other modern encyclopædia.

Therefore, every scholar, every reader, every library, and every institution of learning will wish to know of this great *Second Edition*.

Special Introductory Price

Our method of selling the *Second Edition* will be exactly the same as was maintained in selling the first edition; that is

A special introductory price will be allowed to those who place their orders with us before or during publication.

The price will steadily advance as publication progresses. Therefore, if you would buy the *Encyclopædia* at the lowest price at which it will ever be offered, your order should be placed with us immediately. The volumes will be delivered as rapidly as they come from the press, all charges paid.

Research Bureau. Each subscriber to this *Second Edition* will become a member of our International Research Bureau and may, without expense, consult this bureau freely on any or every subject of interest found in reading or conversation.

If you will send us coupon attached, full information will be given regarding publication and special price.

Equipment of Playgrounds

A public playground is intended to cultivate correct physical and moral development, and supervision and the right kind of equipment are equally important.

Apparatus well planned economizes in space and affords the best way to provide for a large number of children.

We have accumulated a mass of data on the subject of playground equipment, and we are glad at all times to assist in planning equipments without obligating the prospective purchaser in any way. A very efficient equipment can be obtained at a moderate expenditure, when economy is necessary, if properly planned.

"BEAUTY FOR ASHES"

(Continued from page 34)

It is a good thing to cross over the line and take a look at ourselves, and at our belongings, from their viewpoint. How rich, how blest we feel, when we come back to our own homes! I always breathed a sigh of gratitude, when I got home, that I didn't have to wash for a large family, and have a drunken husband who beat me.

What Would We Do?

I have always brought two other thoughts home from those visits. One is, "How much alike we all are!" The other is, "What would I do if I had to live in that dreadful place, and could do no better for my children?" And that is the only fair way to consider the question. What *would* we do, if any of us had such a fate? If *we* had to be crowded and stifled in dark rooms, to breathe foul air and choking odors, to fight filth, to endure noise, to drink polluted water, to be seized upon by disease.

Ah, if that were *our* baby that sickened and wasted and moaned and died! Would we join with those of the sullen brow who are "destructive," because, as they tell us, wrathfully, they'd "like to git even with the landlord?" Or would we be one of the larger number who give up the struggle, hopelessly, overcome by that deadliest of all inhibitions of the poor, "What's the use?" We hear that often in the tenements. "What's the use to be careful of dropping ashes and garbage on the stairs, or throwing suds on the walk, when the other tenants do it?" "What's the use to scrub, when the grime won't come out, and the soot keeps pouring in?" "What's the use to take keer of a house when the landlord won't fix the locks or steps or roof?"

New-comers to a tenement must be of strong fiber if they resist such pressure. In this connection one recalls the most frequent objection made to housing reform, that the poor would misuse and wouldn't "appreciate" conveniences if they had them. A chorus of those whose model tenements are now blessing the poor will contradict this statement. In any place and to any extent that it might be true, it is a startling comment upon our civilization and the severest condemnation of us who have not taught them what is proper and decent.

I trust that those friends of the poor who object to the use of the word "slum," because "it is such a reproach to the poor, who can't help living there," will be satisfied with these statements. The slum is not a reproach to the poor, but to the landlords, to the public, to us. Let us call things by their right names, and place the blame where it be-

longs, and it will hasten the day of the deliverance of the poor.

It has been my dearest hope to win for the poor a closer view and a kinder opinion, yet I fear these recitals will not tempt any one to go and see for themselves how they actually live.

"I went once, and I'll never go again, because it made me so blue," said one dainty lady.

"And it's way across the town, in such a disagreeable part, among the railroad tracks and mean streets, where it's bad to take an auto," others say.

"My business never calls me into those districts where one would find slums," men tell us.

It is a restful delusion, but slums are not all across the town. There may be some families living in squalor in the alley back of one's office. Men may pass the respectable fronts of these places every day, and they may even be on a rear street, near their own homes.

"I'm afraid of bringing home contagion to my children," says the devoted mother.

"There is no need to worry about bringing home contagion," we say, "for the children will bring it home to you. They will acquire other things, too, from the children of the slums whom they meet on the street and in the public schools, other things that they will not come to you with, for you would not allow them to repeat the words and tales they hear."

The Community's Share

We may as well face the fact that so long as we and our children are at large in a community, we shall be in danger from all the evils that are also at large in that community, even those that emanate from the lowest and vilest sources. We might shut our children up in our homes, but even there they are not safe, for they must breathe the common supply of air, and the air, breath, gases and vapors of the whole community have been pooled. And, though we may be able to exclude from our homes the moth, the house-fly, the agent and the burglar, we cannot exclude germs. They ride in on the trails of our gowns, they are tracked in on our shoes. They come in food and drink, in washes, in clothing, in wares. They come by messengers and carriers and servants, as do the influences of evil.

So, if we expect to remain in a community, and not share its evils, we must isolate our entire household, provide disinfected air for them to breathe, and allow them to eat, drink and wear only boiled things. We must not allow them to look out of the window, at bill boards, etc., nor listen to the songs of the street, and we must take out the 'phone. But we need not go to the slums if we do not wish. They will come to us, and, wreaking upon us the Revenge of Neglected Things, they will avenge the poor.

Yet it is not vengeance the poor are wanting. They only want help, and they

The Average Buyer Buys the Remington

If he buys on reputation, he buys the *Remington*. If he buys on side-by-side comparison, he buys the *Remington*. If he buys on nothing short of actual test, he buys the *Remington*. In any case and under any conditions, the Remington is his natural choice.

The actual test is the most decisive of all. If you do not know by actual test the time saving merits of the Column Selector of the Model 10 Remington, then you do not know the Remington Typewriter of today. And the Column Selector is only one example.

ton models; improvements which are the very latest contributions to typewriter progress. The side-by-side comparison or the actual test will convince you that these improvements are a *necessity*—to you and to every typewriter user.

SITUATIONS WANTED

GENTLEMAN, experienced in Juvenile Institutions, desires appointment in an executive capacity. Address 1239 SURVEY.

SOCIAL Worker desires executive position in Philadelphia. Educational or medical social service, welfare work or special research. Experienced. Address 1240, SURVEY.

YOUNG man combines business efficiency with social work. Experienced and successful in both. Thirty, married; good executive, investigator, writer. Address 1241 SURVEY.

SCHOOL MATRON desires position in educational institution. Experienced in managing housekeeping and care of servants. Satisfactory references. Address 1242 SURVEY.

WOMAN employed five years as social secretary in factory desires position in industrial welfare, girls' club work or other social service. References given. Address 1243 SURVEY.

HELP WANTED

WANTED by Church Federation, young woman of experience in Organized Charity methods to organize and take charge of social work in Morristown, N. J. Salary \$1,000.00. Survey recently made by Francis H. McLean. Address R. R. Cadbury, Morristown, N. J.

THE FERGUS FALLS STATE HOSPITAL, of Fergus Falls, Minnesota, has an opening for a woman supervisor. Applicants must be from thirty to forty-five years of age. The superintendent desires to secure a person of good executive ability, and one who is interested in social science work. It is desirable that applicants should have had previous institutional experience, but this is not absolutely necessary.

Salary fifty dollars per month, with pleasant home, board and laundry.

WANTED—A man or woman with institutional experience as superintendent for Colored Orphan Asylum, Riverdale-on-Hudson, New York.

Downtown Chicago Building Bonds

To Net 5½%

Security is a 21-story office building on the principal retail street at one of the busiest corners.

Value of property nearly twice bond issue.

Net income twice interest charges.

Margin of security will steadily increase.

Ownership strong and experienced.

An ideal investment for investors requiring absolute safety of principal and good interest return.

Ask for Circular No. 8310A.

do not dream how much we could give them, besides alms. They stand afar off, and look at us, beseeching, too timid to knock at our forbidding portals. But the White Death, who has been their bed-fellow, is not abashed by any grandeur, or stopped by any bar. He comes straight from the filthy hovel to our homes, and peers in upon us through the windows, while we feast and laugh. He pushes open the door, and strides in, and, sitting down at our very fireside, looks into the faces of our best beloved, so that they cry out and die!

The revenge of the slums falls not only upon the individual, but upon the city, in all its interests and activities.

It falls upon the city in losses of lives and money, taxes paid for pauperism, for crime, for the cost of disease.

It falls upon the civic organizations that ignore the slums, by the blight of their very ugliness and meanness, which frightens renters and buyers from the neighborhood, and injures all adjacent property.

It falls upon them, too, by breeding a class of citizens that are a dead weight to civic progress.

It falls upon the business interests by killing or weakening valuable working men, whose loss is felt in traffic, trade and manufacture.

It falls upon the churches, by raising up those who defeat and defy them, by lowering the whole moral tone of the community, and increasing the resistance to the powers of good. These are the ways in which we are scourged by the slums, and until we learn our lesson, we must continue to suffer as well as the poor.

"The Poor!" There passes before me a procession of those whom I have seen in the alms-houses, the reformatories, the tenements, the hovels of our country. With downcast, hopeless faces, with faltering steps, with groping hands, they file past. Some are ragged, filthy, scarred, diseased. Some are pallid, starved, pitiful. Side by side, step by step with them, march those who are of different blood and birth. One holds out beggar hands, one covers his face in bitter humiliation. Gray as a procession of shadows, gray as a drift of ashes, and with ashes upon their heads—that symbol of burnt out life and hope—they move across my vision, and are lost in the darkness.

"We must cease to cherish such as these or we shall have a race of weaklings and degenerates," we are warned.

Yet the divine plan, as given to us, is that the poor shall be delivered. And He who healed the sick, gave sight to the blind, cleansed the lepers, and even raised the dead, gave the poor into our care with the assurance, "Greater things than these shall ye do."

Greater than these!

Shall they be in the way of prevention?

The GIST of IT—

"CHILD labor is doomed," said Jane Addams at the tenth annual Child Labor Conference, in New Orleans. But sentence has not yet been pronounced and the National Child Labor Committee is harder at work than ever before. Page 49.

RICHMOND has surveyed its housing situation. Conditions are not bad, but only forehanded legislation can head off the inevitable arrival of tenements. Page 54.

THE question whether or not a convict is a slave will come before the Supreme Court of Rhode Island next week. By a quirk in the state constitution, it enters into a suit brought by a convict to recover wages for his work under the prison contractor. Page 47.

H. F. J. PORTER questions whether the standards set by the State Factory Investigating Commission have not legally O. K'd the conditions which took 147 lives at the Triangle fire. Page 48.

HOMES with a little "h" are hard to make for a family of 60 to 100 girls. But the Eleanor Clubs in Chicago have managed it, and been economically independent, too. Their fifteenth birthday was celebrated by opening the eighth club and buying ten acres of camp site. Page 60.

MAJOR HIGGINSON'S Other Fellow and the Other Fellow's critics lead an Englishman to question whether we're going in reform. What can we expect of government commissions? Can reform, of all things, spring forth complete like Minerva? Is the need, perhaps, for more thinking and less printing by a small group working out a symmetrical scheme? Page 50.

THE best place for prisoners, Mr. Lewisohn submits, is outside of jails. But once in, they should be treated like men, paid for their labor and started toward useful lives at discharge. Page 61.

AT the American Statistical Association's seventy-fifth anniversary emphasis was placed on the increasing service statistics is rendering the social sciences. Page 64.

TO celebrate its one hundred and fiftieth anniversary, St. Louis will stage a pageant and masque running back through the pioneer days of French and Spanish to the very first families of the Mississippi Valley—the mound builders. Nothing less than a civic renaissance is expected as the outcome of very careful and elaborate planning. Page 52.

THE clamor of small shopkeepers who welcome the city as a paying guest on primary and election days defeated the bill to open New York city's 620 public schools as voting places. The city and the civic bodies urged it, but the Legislature denied it. There's a chance the governor will include an enabling measure in the call for a special session. Page 53.

AFTER considering the arguments against the minimum wage, Mrs. Warbasse simmers it down to this: "Either it is desirable that all who work be given enough of the wealth they produce to live on, or it is not." Page 57.

Russell Sage Foundation

Among School Gardens

By M. LOUISE GREENE, M. Pd., Ph. D.

A terse and practical book which seeks "to instill in children a love for outdoor work and such a knowledge of natural forces and their laws as shall develop character and efficiency."

It describes in easy style, free from technicalities, the best school gardens in all parts of the country, and gives clear instructions for planting and pruning.

Not alone for teachers and children, but for all who would make their own oats, peas, beans and barley grow.

380 pages, 98 illustrations, 15 plans. Price postpaid, \$1.25.

THE SURVEY

COMMON WELFARE

THE CHILDREN'S BUREAU AND ITS APPROPRIATION

To those who, for six years, strove for the creation of the Children's Bureau, it is disconcerting news that the Appropriations Committee has allotted to it the paltry sum of \$25,000. This is the amount provided in the statute creating the bureau, for the first experimental period ending next June.

The chief of the Children's Bureau, Julia C. Lathrop, asks for \$164,640 to make possible an increase of the staff for 1915 to 76 persons, to carry out a program of work which could be but begun with the initial meager supply of money. The staff has hitherto been limited to 15 persons.

The advocates of the Children's Bureau point out that it has been at work less than two years. Its first annual report issued in March last shows that it has been occupied in laying the foundation for a future career of usefulness. It has attacked the problems of infant mortality from diverse directions. It has focussed the attention of the public upon the fact that we do not know how many children are born or how many die. And it has stimulated effort to save infant lives.

The first publication, Monograph I, Birth Registration, has been widely used in this year's successful campaign for improved birth registration laws. The publication of this pamphlet was requested by the General Federation of Women's Clubs.

Baby-Saving Campaigns is the title of Infant Mortality Series No. I, a compact and informing statement of the efforts made in cities of 50,000 population and over, to reduce the summer mortality of babies.

The monograph on Prenatal Care, intended to be of immediate, practical value to children born during 1913 and 1914, was prepared by request of the National Congress of Mothers. This is the first of a series on the care of young children in the home.

The Handbook of Federal Statistics of Children, Part I, is the first installment of a compilation giving in convenient form data concerning children from

the decennial census, hitherto largely unavailable because scattered through many bulky volumes.

In the near future, the report of the first field inquiry made by the Children's Bureau will appear, a study of infant mortality in Johnstown, Pa. This involved the use of a schedule embodying a picture of the social, civic and industrial conditions of each family studied. How this was carried out is indicated by the fact that, in a house-to-house canvass of families in which a baby had been born during the year, 1,551 schedules were filed, and there were two refusals.

A second forthcoming report is a review of child labor legislation in the United States. Advocates of legislation dealing with this evil are particularly critical of the recommendation of the Committee on Appropriations. They have waited long for a federal supply of data. They point out that the National Child Labor Committee spends annually more than twice the amount of the whole initial budget of the Children's Bureau.

The field and the task assigned to the bureau are specified as follows in the act: "To investigate and report upon all matters pertaining to the welfare of children and child life among all classes of our people, and especially to investigate infant mortality, the birth-rate, orphanage, juvenile courts, desertion, dangerous occupations, accidents and diseases of children, employment, legislation affecting children in the several states and territories."

Social workers in all parts of the country have become accustomed to refer to the bureau requests for information from clubs, from editors and miscellaneous inquirers. Its publications are recognized as authoritative and each issue is awaited by a large constituency.

Already vigorous protests against any cut in the modest estimate offered by the chief of the bureau are reaching Washington. An effort is certain to be made to amend the bill on the floor of the House, and, failing there, to obtain an increase by compromise with the Senate.

COURT TO DECIDE IF A CONVICT IS A SLAVE

THE SUPREME COURT of Rhode Island is soon to decide, for the first time in the United States, whether a convict is a slave, ward of the state, citizen, or what not.

William E. Anderson, formerly a convict in the Rhode Island state prison, has sued the contractors of that institution to recover wages for his labor during imprisonment. The Rhode Island constitution prohibits slavery as slavery no matter what the form may be. The limitation, "except as a punishment for crime," present in the federal and most state constitutions, is lacking in Rhode Island. It is upon this, that Anderson bases his suit. Behind him stands the National Committee on Prison Labor.

The court will hear arguments beginning April 15. As the constitutions of Vermont and Maryland are similar to that of Rhode Island and prison contracts are in operation in both states, similar cases may be filed.

To southern members of Congress, the suit has brought attention to the fact that slavery is not necessarily Negro slavery. It has reminded them that Indian slavery long existed in the Providence plantations; and the oratory of the '50s and '60s may now find echoes in a congressional investigation of "slavery" in a New England state.

Anderson claims a damage in that his mother and other dependents were left in poverty. Fifty cents a day was paid by the contractor to the state for his labor and the use of the prison building, light and heat. How much of this was for his labor and how much for the use of the buildings, light and heat, the contracts do not make clear.

No matter what the decision, it is conceivable that there will be a judicial statement as to what proper rates of wages really are and that the court will define conditions of employment and other interesting questions.

The proceedings are somewhat complicated by the fact that another case is being brought by Anderson against another contractor in a federal court.

Personal elements are not lacking in

FIRE DRILL AND FIRE PANIC

A drawing used by H. F. J. Porter to illustrate his contention that stairways for emptying a burning building must provide a vacant step in front of each person, or row of persons. If more crowd in, panic results.

these cases. One of Anderson's suits is against the Crescent Garment Company, the members of the firm of Salant and Salant, which includes Aaron B. Salant. The other suit is against the Sterling Manufacturing Company, of Chicago, the president of which has been Milton F. Goodman. For those who have heard Mr. Salant and Mr. Goodman express their opinion of each other, it is interesting to realize that both are now defendants to practically the same suit.

Finding the competition of the prison contractors injurious to his business, then operated with free labor, A. B. Salant some years ago formed the National Free Labor Association, an organization which must not be confused with the National Committee on Prison Labor, which is backing Anderson in the prosecution of these cases. Though hampered, as Mr. Salant himself says, by lack of funds, the National Free Labor Association was not wholly ineffective in fighting the contract system.

At that time, as now, the shirt-contracting firms known as the Reliance and Sterling Companies were Salant's keenest competitors. "Prison Labor Trust" is the epithet applied to this group of manufacturers by one "William Phillips", secretary of the National Free Labor Association. Since A. B. Salant has had power of attorney from "William Phillips", and since that is the signature which Mr. Salant is said to have appended to letters on stationery of the National Free Labor Association, it is supposed that Mr. Salant's connection with the National Free Labor Association did not end with its organization.

Mr. Salant, as a clothing manufacturer employing free labor, used the National Free Labor Association to fight the "prison labor trust". Later, Mr.

Salant, as a clothing manufacturer making a profit from contract convict labor, has continued to fight his old rivals. Mr. Salant does not hold a contract in connection with the Rhode Island state prison, but he says: "I negotiated with them [the Crescent Garment Company] after they got the [Rhode Island] contract, and up to the present time all they have made in that place they have sold to us."

In considering what might appear to be an inconsistency in Mr. Salant's activities—in that he both profits from convict labor and advocates its abolition—attention has been directed to a brief filed for him in the Supreme Court of New York in answer to a libel suit brought by Carol Aronovici:

"We submit that there is no reason whatsoever, to the mind of an intelligent man, why opposition to the system is in any way inconsistent with the making of personal profit out of that system while it lasts, i. e. while the government and the people refuse to abolish it. One may, with perfect propriety, argue that the system of prison contracts ought to be abolished, and at the same time seek to derive profit from a prison contract as long as the state insists upon letting out such contracts."

THE TRIANGLE FIRE THREE YEARS AFTER

ON MARCH 25, the third anniversary of the Triangle fire at which 147 girls in a factory loft in New York city lost their lives because of inadequate exits, H. F. J. Porter, consulting engineer, wrote to the press some sharp criticisms of the work of the New York State Factory Investigating Commission. "Astonishing as it may seem," Mr. Porter said, "the commission has actually legalized the very conditions which

it was created to relieve and correct."

The laws passed on its recommendation, Mr. Porter states, are bound to lead to crowding and panic in case of a fire. Readers of *THE SURVEY* will remember that Mr. Porter, first acting with the Fifth Avenue Association, the Public Forum of the Church of the Ascension and the Committee on Safety, and then as an expert for the commission, made a careful study of exit conditions in New York loft buildings.

He determined that in a building with ceilings 10 feet high, a flight of stairs would have 18 steps, each $7\frac{1}{2}$ inches high. Each person going downstairs must have a vacant step in front of him to step on. Therefore, every other step must be left free to afford downward movement. So that such an 18-step stairway would hold nine persons single file, plus one extra person on the landing, or 20 if double file, 30 triple file, etc.

He worked out similar proportions for various typical heights of ceiling. They held good if the stairways were made of rectangular treads, but triangular treads or "winders" reduced the capacity 10 per cent per winder.

Mr. Porter charges that although the principle here laid down was adopted by the commission, liberties were taken with the figures he had submitted when it came to drafting legislation. He charges that the commission adopted as a standard a "dwarf building" having 10 feet between floors, of which none exist except converted tenements, instead of one with 10-foot ceilings, "which I had specified and of which there are hundreds"; and that it has figured "the capacity of a flight of stairs of unit or single width would be not 10 people but 14."

Then, he charges, they fixed the reduction for "winders" at a maximum of 10 per cent, regardless of the number of "winders"; agreed that "if a sprinkler system was installed in the building the occupancy could be increased 50 per cent . . . making in all $22\frac{1}{2}$ people, instead of 10, or an increase of 125 per cent. The commission required two such stairways on each floor which doubled the number of people permitted on each floor and if one of these stairways were cut off by fire the single stairway would have to take care of the added number, thus loading it to over 250 per cent of its capacity."

Mr. Porter's remedy (see *THE SURVEY* for July 15, 1911) is a fire or division wall by means of which the part of a building in which the fire is located can be shut off from other parts and all the inmates can escape horizontally through doorways in this wall, close the fire-proof doors and be perfectly safe.

The *Engineering News*, a technical authority, has strongly endorsed Mr. Porter's fire wall device.

THE HIGH COST OF CHILD LABOR

Two panels from the exhibit of the National Child Labor Committee. First shown at the National Conference on Child Labor at New Orleans, the panels will be duplicated and sent on the road in charge of Lewis W. Hine.

WHAT DO AMERICAN PEOPLE WANT FOR THEIR CHILDREN?—BY ANNA ROCHESTER

THE FIGHT AGAINST CHILD LABOR will enter on its second decade with increased vigor, a wider outlook and a new method, if the spirit and the substance of the Tenth National Conference on Child Labor held last month at New Orleans are a fair indication of the future.

One member of the National Child Labor Committee staff who has attended all these conferences with one exception put it tersely: "These people have set their teeth against child labor. They are in for a fight to the finish." And as Jane Addams said in her address to the mass meeting in Lafayette Square, attended by some 2,000 people besides the 1,000 whom the mayor had arranged to seat: "When people are willing to stand through child labor speeches, child labor is doomed."

Is the New Orleans public typical? Does the spirit of the leaders gathered in conference reflect the temper of the American people? Or is their fighting blood aroused by increasingly insistent opposition to good child labor laws?

Two little incidents at the conference do not answer these questions but they do warn us against an indolent optimism. Telegraphic news was received from four legislatures, and from two of these states came word of defeats on the firing line. Owen R. Loyejoy's review of the needs and activities of the committee

showed how the activities—investigation, publicity, legislative campaigns and study of enforcement—had been restricted in scope and hindered in efficiency by the failure of the rank and file of thoughtful, well-to-do people to supply the wherewithal for a sufficient staff.

Less time than usual was devoted to a description of child labor, but certain unforgettable impressions on the subject were made rather incidentally by Ella Haas and Pauline Neuman, who had been child workers themselves, and by Lewis W. Hine with his stereopticon lecture on the high cost of child labor.

The indigent widow, the uninteresting teacher, the misfit curriculum, the parent who does not control his children, the employer of cheap labor, the inspector who does not know how to inspect, the judge who is out of touch with the new industrial consciousness, the editor who adds to the general inertia by drifting with the majority, and ourselves, the great American people who pass laws and let them die—all these came in for a share of the discussion. The old three-cornered fight between the employer, the reformer and the legislator is still on, but it no longer occupies the center of the stage.

There was a pretty general feeling that the motive for the effort to correlate these scattered erring elements should be found not so much in pity for

the physical harm wrought by child labor as in a keener sense of the stunting of the spirit. The loss in artistic and creative power was touched on by Jane Addams, the degradation of citizenship by Felix Adler. Alexander Johnston made the statement that unless girls are to be mothers of a decadent race they should not be allowed to work in industry until they are 16 or, better, 18 years old.

The National Child Labor Committee presented to the conference for the first time a federal child labor bill drafted by the committee and pending in Congress. Samuel McCune Lindsay reviewed the attitude of the committee in the past and predicted that the same reasons which led the committee recently to endorse the principle would shortly bring about a general demand for a federal child labor law.

The other defenders of the bill were Felix Adler, who pleaded for clear thinking and common sense as the primary guides in division of power between state and nation; Mrs. Florence Kelley, who gave incidents from her personal experience illustrating at once the relative value Uncle Sam has placed on children and on food stuffs and the contrast between our disregard of state laws and our respect for federal law; and A. J. McKelway who quoted millions from the census to show the majorities of American people who have already enacted state laws embodying the four provisions concerning ages and hours which the Palmer-Owen bill would apply to establishments manufacturing goods for interstate commerce.

Here, again, the fine temper of the New Orleans audience was manifest. for it listened with keen attention and enthusiasm to the speakers on the federal bill. Afterwards several business men confessed to immediate conversion to federal legislation on child labor.

When one remembers the relatively high standard of the Louisiana law as it is enforced in New Orleans and realizes that the Palmer-Owen bill would affect New Orleans' factories in only one respect, one wonders whether the real source of opposition is going to be not the states' rights doctrinaire but the employer whose present convenience will be at stake.

In quite another connection Wiley H. Swift gave a little parable which is suggestive. He has been working against the cotton mill lobby in the Carolinas for two years past and his analysis of the opposition to better state laws is based on personal experience: "If the sawmill men of your state had always used mules and it was proposed that they should give up using mules and use oxen instead; and if they agreed that it would be better to use oxen and a law should be introduced to compel them to substitute oxen for mules; and then if they did everything in their power to defeat the law, wouldn't you think that they wanted to use mules?"

AT THE time of the appointment of the Industrial Relations Commission THE SURVEY published a symposium¹ on its field of work. In what follows it is not desired to criticise in any way either the views expressed in the symposium or the merits of the commission itself. The usefulness of such an official study of industrial relations may be taken as proved, and the views expressed in THE SURVEY are here used only as texts for a discussion of tendencies observable, not especially in the United States, but in all civilized countries at the present day.

The symposium shows in several contributions a keen realization of the pitfalls which await government investigations of this nature. It is feared that the commission may be led away by a desire to "make a very impressive showing"; or again that its labors may result in "another bulky report which will indeed furnish abundant material for propagandists and students; but which will leave the public little wiser for effective action."

These apprehensions are not unnatural. Every public investigation is open to such dangers. But this "is to be a new kind of commission." The taking of technical or expert evidence is not to be among its duties. It is rather to draw its conclusions from evidence already at our disposal. It may indeed hear testimony, but the testimony is to come from experts in synthesis and from those who represent the passions and the living forces of the present hour; the time for the collection of mere raw material is past. "We do not need judges and umpires;" "we should try to prevent evil."

In all civilized countries at the present day men are wearying of technical reports with their bulky appendices. Government commissions are expected to furnish, not expert recommendations, but statesmanship. Their members, like the members of the Industrial Relations Commission, are chosen from among men who have given a life's attention to the problems involved.

But this being so, what is expected from them? Is it expected that, from the hour of their official designation, they will approach the massed material from a fresh standpoint and with new powers of synthesis and interpretation? Surely not; no man can be called on in one year or two years to fertilize this chaos and produce a world. What they do is to give to the state in an official capacity the fruits of a knowledge already ripened by years of study; their reports are not the digestions of the evidence printed in their appendices, but the conclusions long ago reached by private citizens and modified only slightly,

¹THE SURVEY of August 2, 1913.

FROM THE STRIFE OF TONGUES

Some Reflections on
the Tendencies of
Reform

By an
ENGLISH CONTRIBUTOR

if at all, by brief service on a government commission.

And thus the inevitable question arises: What is gained by the issue of Mr. and Mrs. Webb's statesmanlike views on the English poor law in the guise of the minority report of a government commission? Government patronage can facilitate the collection of evidence; but where the collection of evidence is not desired, can such patronage give to the views of life-long students an added prestige or effect? Can any service be rendered by such commissions in this official capacity which they could not equally well render in collaboration as private individuals? And if not, why do we continually expose ourselves to the admitted risks of publicity, when private collaboration can be made equally valuable?

It would, of course, be puerile to level this criticism at the Industrial Relations Commission, or at any other particular commission. It is only valid as the criticism of a tendency. In any particular case the government may have other and ample reasons for its action; it may need a commission to force certain questions on the public attention, or a temporary commission may be necessary to prepare the way for a permanent one; it may be necessary to have a Chicago vice commission in order to obtain the appointment of a "morals commission."

But besides all this there is, in every country where the imagination has been touched by the prevalence of abuses and the possibilities of reform, a tendency which is a fair object of attack. In a democracy we must carry through our policies in the open, before the eyes of the people. But today we are going further; we are doing our thinking in the open also. Because our creed must be made a public profession of faith, we seem to think that we must carry out into the market-place the doubts and the struggles, the prayers and fears which

go to the making of our creed. This does not apply only to the crude mistake of many young men who "go into politics" before they have prepared any mental ground on which to take their stand; it applies also, and in a far more dangerous degree, to the subtler mistake made by those who, having found a political faith, try to form a party in the open rather than a school in private.

This surely is not democracy but indolence. It is part of the general spirit of hurry engendered by modern popular government—the desire to throw ourselves at once into the breach, relying not upon an organized and disciplined regiment behind us but upon our power of rallying by our voice and our example the scattered masses of the doubting and the careless. There is no lack of energy or ideals in the world today, but there is a lack of patience; we fight with half-forged weapons and hope to convert majorities without forming a compact minority; we scamp the work of preparation, the continual labor of personal teaching, the testing and re-testing of foundations which such teaching entails, the painful processes of discipline, the intimate communication of our own faith without which we can form no reasoned school of thought worthy of the ideals which we hold. It may not be a fair criticism to say, as Walter Lipmann says in his recent book, *A Preface to Politics*:

"The desire to affect the whole mass crowds out the courage of the innovator;" but it is surely true that this desire too often leads the innovator to break the mould while his policy is still more or less an incoherent mass.

This criticism when made in any particular case has little chance of acceptance. Men who have spent the best years of their life in a weary fight for reforms are rightly impatient of any suggestion that the publicity to which they have recourse is dangerous or premature. And yet it is rare indeed to find any such fight which has not been carried on throughout in the open; such men forge weapons, but they usually forge them in large conventions or in the columns of the press; they are seldom content to miss an opportunity of forcing into law an isolated and disconnected fragment of their policy.

The Fabian Society in England is a good instance of what we mean. Its great influence on thought and politics has been mainly due to the policies with which it has devoted itself to the formation of a school. Its quiet propaganda at the universities and elsewhere will probably be found to have had a more permanent effect than its pamphlets. But in so far as it has, during its period of preparation, come into the open, advocated public measures and influenced the policy of legislators, some doubt may well be felt as to the efficiency of its

work. Many of its members deplore, and some have openly attacked, the defects of the recent insurance act; yet historians may well trace the passage of such ill-considered legislation indirectly to the influence of the society itself and to the general drift in politics helped on by it during the last few years.

We ask in all seriousness: Is it impossible to form consciously and quietly a school of study and preparation, to carry on the work steadily for a number of years and eventually to throw into the scales of politics a compact group which, acting upon full conviction and knowledge, shall devote their energies to the carrying through of a symmetrical scheme? We are doing many analogous things in the way of schemes for the training of public servants, or in the way of bureaus of municipal research. Might not a few men combine to form, unadvertised to the world, a kind of private school of statesmanship? Clubs have before now in history come to direct the course of politics for good or evil.

All such pictures are of course utopian; we shall never evolve such a perfect group or scheme; but we may perhaps approximate to the ideal. After all, the spectacle of Minerva springing fully armed from the head of Zeus was probably only startling to those who had not observed how much thinking Zeus had been doing before-hand. Minerva's birth, is, at any rate, a more satisfactory conception of truth than that classic justification of a free publicity—Milton's conception of truth as a shattered corpse to be gathered together bit by bit.

At least such an ideal way helps us to eliminate some of the dangers of present tendencies. Patience is really not so utopian as haste. If a fully armed Minerva is not possible now, it may be because the time has not yet come for the great conflict. We love to speak of these days as a time of transition, but perhaps if we were wise we should recognize that the time of transition is the day of small things, of patient plodding after truth. This is not the paradox it may sound: the farmer picks his fruit, not in the storms of March or November, but in the slow mellowing of the year. If, as we too often do, we go out into those storms with half formed philosophies on our lips, the wind of publicity may well whirl off some half considered sentence, ring the changes on it round the world and make it the catchword of a blind movement.

One of the ideas running through much of the symposium from which we have quoted may be taken as an illustration—namely, the appeal to the "principle of industrial democracy." This "principle" has much to recommend it; it has a foundation in proved fact; it has behind it the philosophy of generations. Yet to some of us it may seem to leave untouched and unexplained much which needs to be touched on and explained by any interpretation of the coming era which claims to be fundamental.

For if indeed "we have entered upon a well-defined era of industrial constitutionalism just as political constitutional-

ism took shape in the western world in the eighteenth century"—if that be the fundamental characteristic of the present movement—then there are many of us who will see in the coming era little promise and little hope. We cannot but remember how often recently our present ills have been ascribed to the character of eighteenth century constitutionalism. We may well doubt the benefits conferred upon many European countries by their imitations of the English system.

"Political constitutionalism" will not explain a hundredth part of the phenomena of the French Revolution. It lies very near the surface but very far from the heart of the movements of the last two hundred years. Socialism and syndicalism have been, each in turn, a protest against its disappointments. Perhaps "industrial constitutionalism" is like its predecessor, only some new variant of an ideal in its essence as old as the Hildebrandine popes—only another attempt to erect, by some fresh device of organization or variation of system, a new pinnacle whereon may at last be set a human power which shall be in fact, and not merely in name, "the servant of the servants of God."

Surely in a quieter study, in an inquiry which should take into account all those strands of thought which we are apt to ignore because it is hard to weave them into the fabric of public speech, we might obtain a clearer insight into our social sins and social needs, and gain from that insight at once a deeper repentance and a brighter hope.

THE GHOST

SARAH N. CLEGHORN

But twelve short paces from the lighted parlor,
Its rosy shaded candles
And tinkling pianola,
Where the young daughter of the house makes
merry
With store of boon companions,

Eileen sits lonely in the silent kitchen.
A little sad and drooping
She looks in her black house-dress.
So young she is, so strangely solitary!
So dimpled, and so sombre!

(Methinks Eileen knows how to laugh and frolic,
To turn the quick bright answer,
To dance the reels of Galway,
And sing the ancient Irish fairy ballads
In Oh, the lilting treble!)

What ghost comes gliding through the pantry
doorway?
A stalwart ghost and comely,

Red-cheeked, in gingham apron.
Straight to Eileen she goes, and lays a friendly
Touch on her drooping shoulder.

"Sure I'll stay with you now awhile, mavourneen:
There's none of them can see me:
No second sight among them:
There's not a creature in this town or county
A seventh son or daughter!

"By Bridget's soul, I wish it was the old days:
For old folks worked together,
And old folks played together.
To leave a young thing lonely in the kitchen
Would spoil an old-time party.

"Ah well! Folks were Americans in those days.
Queer! Though the work was harder,
The help was always plenty.
Whist now, don't cry! There'll soon be room,
mavourneen,
For one more in the factory."

CIVICS

THE ST. LOUIS PAGEANT *and* MASQUE

ITS CIVIC MEANING

BY ROGER N. BALDWIN

CIVIC LEAGUE OF ST. LOUIS

FOREST PARK, WHERE THE PAGEANT AND MASQUE WILL BE HELD, WAS THE SITE OF THE LOUISIANA PURCHASE EXPOSITION IN 1904. THIS VIEW IS FROM ART HILL WHICH AFFORDS A NATURAL AMPHITHEATRE SEATING 60,000 PEOPLE. THE SCENIC ADAPTATION OF THIS SETTING IS BEING WORKED OUT WITH A MINIA-TURE MODEL AS SHOWN ON THE OP-POSITE PAGE.

Behind the greatest civic drama ever projected in the United States lies the idea of building on a spectacle of the past a new city unity for the future. All St. Louis—from youngster to oldest inhabitant—is stirring with preparations for a gigantic pageant and masque to be held the last four days in May, in celebration of the one hundred and fiftieth anniversary of the founding of St. Louis by Laclède.

The drama will take place in a great natural amphitheater seating 60,000 persons, and 7,500 men, women and children will take part. The stage, thrown across one of the lagoons left from the World's Fair of 1904, will be the largest ever constructed.

The pageant will present the history of St. Louis, rich in incident and color, from the early mound-builders, through the Spanish and French occupation and on into the century of remarkable growth of the great West. The masque will portray the struggle of civilization—the triumph of the city and of democracy.

It is a civic undertaking enlisting the co-operation of public officials and the leaders of nearly a hundred civic, labor, business, professional and patriotic associations. Practically every agency of government is participating—the schools, library, park and municipal administrative departments.

This great spectacle is, however, to be merely a vehicle. It was conceived and promoted as a purely civic enterprise, devoid of any feature of com-

mercialism, to rouse a great city to a sense of unity, of common understanding, of common effort. Its purpose is well expressed in the phrase adopted as its slogan, "If we play together, we will work together."

St. Louis needs to learn that lesson. Like many other cities, St. Louis is divided within itself—geographically, racially, socially. Its very prosperity and even growth have prevented that vitalizing of domestic relations on which democratic processes for the common welfare build.

So the great drama is to visualize the city's life, and bring forth into expres-

sion all the latent power for a new citizenship. Groups of citizens who have never known of one another's existence have been brought together. On the score of committees in charge of the various departments are men and women, present-day immigrants and descendants of early French and German settlers, colored and white, young and old, business men and laboring men. Among the 7,500 performers men, women and children of all nationalities, from all parts of the city, and in all walks in life are being enrolled.

It is out of this democratic contact in the cause of a celebration of the com-

Park commissioner, who is helping to make the pageant a reality.

This mound, 16 acres in extent and 100 feet high, is now part of an Illinois farm. A movement has been started, in connection with the pageant, to secure congressional action for the preservation of the Cahokia group.

CAHOKIA MOUND, ONE OF A GROUP ACROSS THE RIVER FROM ST. LOUIS, IS THE LARGEST REMAINING WORK OF THE MOUND BUILDERS

mon civic life that a new spirit is bound to spring—a spirit which will give St. Louis the power to do big things and to do them through her citizenship as a whole. In the past it has been the business community which has done things, the men of money and power. Today with the new democracy in government, with the initiative and referendum in state and city, the whole community must be the doer of deeds. And this is the first challenge in St. Louis to the capacity of the whole community. Even the funds are being democratically raised. It is not a business man's affair. Everyone is being asked to contribute, if only a few cents. Collections are being made in every corner of the big city.

This great pageant and masque has more than a local significance. It is a significant contribution to the civic drama of America, not because of the tremendous scale on which it is projected, but because of the quality of the talent behind it. The local committee has secured the services of the foremost experts and artists in the United States to write and stage it. Percy Mackaye, the distinguished dramatist and poet wrote the Masque, and Thomas Wood Stevens of the Pittsburgh School of Drama, wrote and will stage the pageant. Joseph Lindon Smith, pageant master of international fame, will stage the masque the music for which was written by

Frederick S. Converse, leading American composer.

The inspiration of the pageant will be spread, it is hoped, to other cities by means of the participation of their representatives in the masque. Invitations have been sent far and wide by the mayor to the mayors of all the large cities of the West and Southwest, asking them to send heraldic envoys, typifying the new co-operation between cities, to take part in the demonstration.

"But," says John H. Gundlach, chairman of the Executive Committee, and leader in all movements for building the city of the future, "much as we prize the good opinion of sister cities and states; proud as we shall be of the matchless beauty of pageant and masque as it unfolds itself in never-to-be-forgotten pictures and dramatic episodes to the multitudes who will gather on the

green slopes of Art Hill in Forest Park . . . our one great hope is that out of the beauty of art, of community intercourse, of historic inspiration and uplifting prophecy of the future, will spring an aroused civic pride and love of home, that will develop a sense of community obligation and mutual co-operation of such force as will sweep into being a new era in our municipal life. . . . Ask yourself in all candor whether it will pay to bring together on the great stage at the foot of Art Hill the boys and girls, the men and women, of the East and West Ends, the North and South Ends, to be stirred by one common purpose; re-enacting with the joy of life in their eyes the romantic history not of my city, not of your city, but of our city, the place that shall give us the priceless blessings of a unity before unknown."

WHERE SHALL THE CITIZENS OF NEW YORK VOTE? —BY CARL BECK, CIVIC SECRETARY, THE PEOPLE'S INSTITUTE

THE LATEST STATISTICS show that 529 schoolhouses scattered throughout the country are already used as polling places. Chicago is thus using 70 schoolhouses this spring. This is in line with the wider civic use of schools and other public buildings, a phase of the now popular social center movement.

However, what Boston, Chicago, Wor-

cester, Grand Rapids, Madison, Milwaukee and Los Angeles have found by practical experience to be an efficient, economical and worthy use of school buildings is denied to New York city by the state Legislature. The Simpson-Goldberg bill, which would empower the Board of Elections of New York city to designate schoolhouses and other public buildings as polling places, was passed by the senate but failed in the assembly despite resolutions in its support by delegates from the Honest Ballot Association, the Citizens' Union, the Municipal Government Association, the Young Republican Club, the Board of Education, the Board of Elections, the office of the corporation counsel, the City Club and the People's Institute.

The People's Institute gave publicity to the facts concerning the availability of New York's 620 public schools; the Board of Education favored such use; the Board of Elections requested the corporation counsel to draft the bill. But the clamor of small shop owners, whose shops are rented to serve as the city's 1,780 polling places, seemed sufficient to defeat this practical legislation.

Should Governor Glynn, in calling an extra session of the Legislature, be persuaded to recommend specifically the

One of many pool rooms used as polling places in New York's last mayoralty election. The citizens of New York exercised their highest function of citizenship in 413 barber shops. Noodle shops, bakeries, butcher shops, laundries, fish stores, basements and blacksmiths' shops were also used.

This clean, spacious, dignified public school is only a block from one of the pool rooms used in the last mayoralty election. New York's 620 schools and 554 other public buildings would provide appropriate polling places and save the city upwards of \$125,000 at each election.

further consideration of the Simpson-Goldberg bill, the civic and social agencies of New York city will have another chance.

By using public buildings for the public business of registering votes, it is estimated that New York would save at least \$125,000 at each election. By eliminating the trouble and time required for hiring quarters, and the expense and bother of transporting and storing voting paraphernalia, greater efficiency would be secured. The location of the polling place would become fixed and regular and thus well-known, instead of being changed frequently to a different shop or store. Education in practical civics would be offered children in the schoolhouse where voting takes place.

A sense of ownership would be instilled in citizens, especially among immigrant citizens who have had little connection with the public schools except indirectly through their children. The sanctity of the ballot would be upheld better in quiet and dignified surroundings than in dingy stores. And untrammelled voting would have a greater chance of preservation in company with honest education free from partisan political influence.

The use of schools would eliminate pernicious political patronage through the custom of allowing district captains to designate polling places and thus have the opportunity also for graft in connection with the renting of barber shops and pool rooms. On the other hand, if polling places were in schoolhouses politicians would be freed from annoying obligations to clamoring store owners, all of whose stores cannot be rented.

The 620 schools of New York city, it has been estimated, would accommodate 1,240 polling places out of 1,780 that were used in 1913. The balance of 540 could be placed in other buildings such as libraries, armories, fire halls,

police stations, and if necessary, in street cleaning buildings of which there are altogether 554.

HOW RICHMOND IS HOUSED—By John Ihlder, National Housing Assn.

AN UNUSUALLY interesting illustrated report issued by the Society for the Improvement of Housing and Living Conditions in Richmond, Va., shows again that bad housing is confined to no one city or class of cities nor to any section of the country. The people of Richmond should find value in its presentation of facts which, though long ignored, bear directly upon their prosperity and well-being. When a death rate is as high as that of Richmond it certainly indicates that something is so far wrong that investigation is imperative. This investigation, made under the supervision of G. A. Weber, secretary of the society, shows at least where part of the trouble lies.

Richmond, like most southern cities, is fortunate in that it is still predominantly a city of small houses. According to the United States census of 1910 the average number of persons per house was only 5.7. In the districts studied by Mr. Weber the average was even smaller, 5.4 whites and 4.9 Negroes per house. But the tenement evil is already threatening. Not only are old mansions being converted into barracks for many families, but "apartment" houses designed to accommodate as many as forty families each are being erected in fashionable neighborhoods. And all this without any adequate attempt at regulation by the public authorities. To quote from the report:

"There are no regulations concerning land overcrowding. An apartment or tenement house may cover every square foot of the lot on which it is built, leaving no yard or court for light or ven-

tilation, and it may be built to any height. There are no restrictions concerning the size of rooms in such houses, no provision for lighting or ventilating halls, or for the adequacy of water supply or of water-closet accommodation. In dwelling houses of three or less families there are no requirements whatever concerning light or ventilation, and a landlord may provide as many dark rooms as he chooses."

On some of the best streets there are already apartment houses which occupy nearly all of their lots, depending for light and air upon vacant lots or the yards of old single family houses next door. When these neighboring lots are similarly occupied the district will begin to go down and Richmond will suffer as other American cities have suffered, a tremendous loss in real estate values.

But these "apartment" houses are still too new and too few in number to be much more than a threat. Before that threat has been made good we may hope that Richmond will enact a housing code which will adequately regulate future building as well as bring existing dwellings up to a fairly wholesome standard.

The conditions which contribute now to Richmond's high death rate are found chiefly in the poorer districts. There are dwellings "which are poorly lighted, unventilated, damp, imperfectly drained, exposed to undue fire peril, in bad repair, vermin infested, disease infected, with unclean surroundings, with insufficient water supply, without toilet accommodations adequate for comfort, cleanliness or privacy, with defective plumbing, with overcrowded rooms, and with cellar tenements"—all the bad features that are found in the neglected portions of our other cities. Richmond has dared to look its facts in the face. Legislation setting proper housing standards is the next step in its advance.

EDUCATING TENEMENT DWELLERS —By Nellie Reeder

Brooklyn Bureau of Charities

A CAMPAIGN among tenement dwellers, to educate them in cleanliness, order, ventilation and proper waste disposal in relation to health, fire prevention and safety, has been carried on by the Tenement House Committee of the Brooklyn Bureau of Charities. At first it was planned to make clear to tenants their rights as well as their responsibilities. But the need for informing them as to their rights was soon found to be less urgent than the need for impressing them with their responsibilities. The tenant seems to realize fairly well every one's duty but his own.

As to sanitary conditions tenants' efforts can accomplish much. Accordingly, the committee undertook, by means of clubs and associations connected with schools or churches, to make an active campaign for better sanitation in specified districts. Illustrated lectures were given, bringing out the essentials of the law and what can be accomplished by the individual tenant.

An interesting feature of the educational campaign was the establishment of demonstration flats where girls and young women are taught how to live and maintain proper standards with given conditions typical of those in the neighborhoods in which they live. In each of three flats provision is made for classes, lectures and practice work. Some of the classes are especially for mothers. The demonstration flats are maintained by organized groups of women interested in each district. They are furnished cheaply but with taste and in a strictly sanitary fashion with goods obtainable in nearby shops.

In addition to the groups meeting in these flats, two other housekeepers' clubs, sometimes called Tenants' Leagues, have been organized. These meet in the public schools. The educational secretary of the committee discusses various problems with them and receives their complaints of violations of the tenement house law.

The campaign has been carried on by means of lectures and informal talks with the aid of the housing exhibit consisting of large posters, pictures and models of an old law house and a new

TEN COMMANDMENTS REGARDING OPEN LOTS

1. Love your neighbor's lot as you do your own, but be sure to love your own.
2. Don't plant tomato cans or rubbish on unused land, their fruits are withered civic pride.
3. Don't allow yourself or your city to create dumps for waste. It can be made to pay for its own destruction at a profit.
4. Don't allow tumbled down buildings to stand on valuable land, they are financially wasteful; they create filth, invite vice and are a menace to life.
5. A fence that has ceased to be a fence and has become an offence, should be repaired or destroyed.
6. Unregulated advertising on unused land pays for the maintenance of a public nuisance.
7. Two gardens may grow where one dump has bloomed before.
8. School gardens are valuable adjuncts to education and recreation. They can be cultivated on an open lot.
9. Let the children play on the unused land so that they may become strong and keep out of the hands of the law.
10. Let not an inch of land be kept in idleness. It has a divine right to bear fruits and flowers and ever serve the highest interest of man.

SUBURBAN PLANNING ASSOCIATION

412 EMPIRE BUILDING " " " PHILADELPHIA, PA.

law house. The text of all school talks is cleanliness. All talks are supplemented by distribution of cards giving "ten housing commandments" and pamphlets giving clearly and simply what the law requires,—the duties of the tenants and the duties of landlords.

HOUSTON'S NEW TAXATION PLAN

HOUSTON, Texas, has recently made great progress in the direction of the single tax. The taxation plan now in effect provides for the taxing of land exclusive of improvements at 70 per cent and improvements at 25 per cent of their value.

The first single tax germ planted in Houston was about thirty years ago, when the shops of the Southern Pacific Railroad were brought to the city. It was tentatively agreed between the city officials and the Southern Pacific board of directors that while the property on which the shops were located should be assessed at its true valuation, the improvements on the property would be taxed at only a small figure. This tentative agreement was gradually extended to all of the railroads which improved

property in Houston.

Twenty years ago, when H. F. Ring, an ardent single taxer, was city attorney, the city council took another important step by separating the land values from the improvement values on the assessment rolls. Before that time all property, improved or unimproved, had been lumped in valuation on the assessment rolls and the tax payer had no idea how much of his taxes paid were for land and how much for improvements.

Three or four years ago, J. J. Pastoriza, a single taxer, was named city tax commissioner. He installed the Somers system of assessing property for taxation.

Writing in *The Public* in the issue of January 9, 1914, Mr. Ring said of the adoption of the plan in Houston: "It revealed here, as it will probably everywhere else, that the real estate of the rich was being assessed at about 40 per cent of its value and that of the poor at 80 per cent. The assessed values of land, exclusive of improvements, in the business part of the city and in the suburbs held in large tracts, was raised, often from 100 per cent to 200 per cent and sometimes more, in one instance the

Hutchins, Kansas Eagle

STITCHES IN TIME

Had Father Noah been quite wise he would have killed the pair of flies that roosted in the ark; he let that pregnant duty slide while he and Shem and Japhet tried to navigate their bark. Two flies were all there were, all told! And Noah might have knocked them cold with one good husky swat; he had the chance—he let it slip while he was mooning round his ship—the knowledge makes me hot! And ever since the sons of men have toiled and wrought and toiled again, to kill the measly flies; the more we kill the more we find, the more we knock the blamed things blind the more their legions rise. We're all, like Noah, more or less responsible for the distress that makes all hope seem vague; we see some ugly things alive, and let them live and grow and thrive until they are a plague. We calmly view the noxious weeds, and habits bad, and evil deeds, which breed so beastly fast! We let them grow and multiply as Father Noah did the fly and kick ourselves at last. "A stitch in time," the poet said (he had a long and shapely head), "will save you nine, by gum." And nothing truer will you find in all the years that lie behind, or all the years to come. WALT MASON.

increase was 1500 per cent, and that of the small homestead owners, and that also of the rich, was reduced in many cases."

By the new system of taxation no attempt was made to tax credits, money in the bank, household goods, etc., but the revenue of the city, with some small exceptions, came from the land valuation, with the 25 per cent of the value of improvements thrown in as good measure. To this was added 25 per cent of the value of stocks of goods carried by merchants. Franchises, under the first year of the system, it were assessed at \$1,800,000, being the first time they had been assessed. Last year they were assessed at \$2,200,000. With this income, and with the system of taxation equalized, more than 5,000 home owners in Houston found that their total taxes for the year were less than for the preceding year.

In the south end of Houston there stands a single tax cabin where single taxers frequently meet for discussions and debate. The property on which this cabin stands was purchased by J. J. Pastoriza, now city commissioner, when he was first converted to the single tax theory. He paid about \$350 for the property, as it was then far out. He put a sign on the cabin that no improvements would be made, but that when the value of the property to a purchaser became \$5,000, he would sell it. In the meanwhile the city has grown out towards the cabin and the land has jumped in value by leaps and bounds. He has had several offers that almost touch the price he placed on the property.

"There is the single tax example," he says. "I have not improved the land. It has lain idle. Yet in these years its value has raised from \$350 to nearly \$5,000. The increase is my unearned increment. I have not created the profit by any labor of mine. This land then, that increases in value by its position and the improvements about it should return of the unearned increment its pro-rata of taxes. All of the property in the city, most of it returning unearned increment, should support, by taxation, the government."

PENNSYLVANIA CITY PLANNING LAW CONTESTED

THE RIGHT of Metropolitan Planning Commissions in Pennsylvania to assess city boroughs and townships in order to defray the expenses of such commissions is being contested in the courts. Following the preparation of a bill by the Pennsylvania Suburban Planning Association, the Legislature a year ago enacted a law whereby metropolitan planning commissions were created for districts surrounding and within twenty-five miles of the limits of cities of the first and second classes.

The significance of this law was pointed out in *THE SURVEY* for June 7, 1913. Its purpose is to secure through co-ordination of the work of the various governmental units within the areas covered by the commissions, far-sighted plans for the development of comprehensive systems of transportation, better sewage and garbage disposal, improved housing and sanitation, playgrounds and

ALL THE CHILDREN OF BENNINGTON, VT., OFF FOR A SLEIGH RIDE

civic planning and improvement. Over two hundred governmental units in Pennsylvania were thus placed under supervision of metropolitan planning commissions.

According to the law the commissions may employ secretaries, engineers, or other experts and may incur expenses which shall constitute a charge on the treasury of the cities, boroughs and townships within the district not exceeding one-tenth of a mill of their taxable values.

Opponents of the law contend that it is unconstitutional under a clause of the state constitution prohibiting the general Assembly from delegating to any special commission any municipal function. On these grounds, the township of Radnor has brought suit against the Metropolitan Planning Commission appointed in its district, and other townships are expected to do the same.

CALIFORNIA RECREATION COMMISSION

The California Recreational Inquiry Committee, created by the Legislature and to report November 1, 1914, has divided its work into three sections: 1. Why we need recreation—treated from a biological, psychological and sociological standpoint. 2. What facilities we have for recreation, public and commercial; unused facilities; lack of facilities in rural communities and mining camps. 3. What the state needs in recreational facilities: recommendations to communities, industrial plants, state departments, and bills to be submitted to the Legislature.

The members of the commission are Senator Herbert C. Jones of San Jose, appointed from the state Senate; Judge H. S. Peairs of Bakersfield appointed from the Assembly; and five citizens appointed by the governor; James E. Rogers of San Francisco, representing charities; Chief of Police Vollmer of Berkeley, representing police; C. S. Stebbins, Chico State Normal School, representing schools; Dr. Grace Fernald, Los Angeles State Normal School, representing juvenile court work; and Bessie D. Stoddart of the Los Angeles Playground Commission, representing recreation.

A VARIED RECREATION PROGRAM

Bennington, Vt., had a community sleigh-ride on March 9 as part of the town's recreation program. Every sort of sleigh and box on runners was pressed into service, whether its usual job was hauling groceries, coal or baggage.

The recreation activities for last year in Bennington show how varied a town's recreation program may be and how much can be accomplished without regular playground apparatus. Not only was a summer playground maintained, providing for tennis, base-ball, volleyball and other games, but there were popular concerts, a community Christmas tree, a pageant of patriots on Washington's birthday, story telling, a baby contest, athletic meets, skating in safety for five weeks and folk dancing festivals.

The total expense last year was \$1,638.35. The village voted \$500 and the rest is raised by private subscriptions. The work is in charge of the Civic League, a group of young women. Hilda Pratt, president.

HOUSING LAW LESSENS FIRE DANGER

The state fire marshal of Indiana has found ready to his hand a most effective means of reducing the annual waste from fire for which America is notorious. Last year the Legislature enacted a housing law which applies to all the cities of the state, and which, among its provisions designed to safeguard the health and lives of dwellers in multiple houses, contains a number that will greatly reduce the fire hazard. These the marshal has discovered and the newspapers in every part of Indiana have recently told what he has said about this housing law.

The provision which appeals to him most strongly is that requiring all tenement houses more than three stories high to be of fireproof construction. Other approved sections are those forbidding a closet under a stairway leading from the first floor to an upper story, the storage of inflammable materials in any tenement building and the obligation upon the owner of providing proper metal receptacles for ashes and rubbish.

INDUSTRY

A REPLY TO THE CRITICS OF MINIMUM WAGE LEGISLATION—BY BERTHA BRADLEY WARBASSE

MOST OF THE countries of Europe and twenty-three states of our own country, have declared through workmen's compensation acts that the preservation and upkeep of an industry should include its human machines. Identical in principle and springing from the same basic idea is the proposition that the minimum of wage payments should not fall below a level at which life and efficiency can be maintained. An industry incapable of supporting its workers at such a level, for a long time has been recognized as parasitic, subsidized by that part of the community least able to bear the tax.

It would seem that anyone who recognizes workmen's compensation acts as just and economically sound should logically accept the correlative need of an established minimum wage. Nevertheless the justice and feasibility of a minimum wage law are alike being questioned. Some of the objections raised are that the personnel in industry would be unfavorably affected by such legislation; that the worker now receives all he earns; that stimulus and ambition are effective agents for securing wage increases; and that immigration will be stimulated. These contentions may well be examined.

It has been stated that a minimum wage law will throw out of work the weaklings and incompetents, none of whom can produce wealth enough to justify the payment of a living wage, and that the competent alone will be retained in employment. But obviously the places made vacant must and will be filled by workers competent to earn the minimum wage who were out of employment. That is, one class will be thrown out of work, and two will benefit—the competent unemployed and the competent who are employed but not receiving a living wage.

Now, in detail, who will be thrown out of work?

(1) Incompetents, *i. e.*, mental defectives, Binet children, in whom years can never develop ability sufficient to produce, under competition, enough wealth to be entirely self-supporting. Occupation of some kind, under some conditions is important for them and should be provided; but it is already recognized that the ordinary factory or shop is not the best solution of their problem.

(2) The old, crippled, and partially disabled, a group whose numbers in standardized industry are hardly sufficient to warrant consideration above the good of an overwhelming majority, and for whom workmen's compen-

sation acts and social insurance should provide.

(3) Children. Be they never so capable for their years, the total product of their efforts would be no equivalent for a legal minimum wage.

Second, whom will the law benefit?

When mental defectives, the crippled, the aged and children are turned out of standardized industry who will fill their places? What permanent class of the unemployed have we in America? Not women, not children. It is pitifully easy for them to get work. But it is often tragically hard for the father of the family to find it. The unemployed in America are unemployed *men*. Why is this so? Is it not because a man demands a living wage? Because he personally tries to exact a minimum wage from an employer who finds it cheaper to get several girls at a less total cost and a larger total output? Why did not the Illinois glass furnaces employ men to carry the output from furnace to furnace? Because, before the passage of legislation forbidding it, they could and did get little boys to do the work at \$1.50 a week. The average life of these ten and eleven year old children was short after taking employment.¹ But arithmetic easily shows it was cheaper for the employer to hire children whose families fed, kept and buried them than to have given a living wage to men. A minimum wage would throw out of employment the children who work all night in the glass factories of Pennsylvania, who work in mines, cotton mills, and factories all over our country. Is feeding our children into the mills of industry the best thing we can do for them? Any law, minimum age or minimum wage, that will help correct this economic abuse seems worth urging even if it carried no other benefit.

Who should do the work of the world? Incompetents, mental defectives, children, cripples, old people? While strong men cannot get work? Any re-adjustment of labor groups must work hardship to some individuals and to some classes. To such temporary distress we should apply whatever temporary relief is needed. But if this fundamental wrong is to be in some measure righted, this mal-adjustment corrected, is not the ultimate outcome worth whatever suffering it entails?

To those who have believed that labor

¹Helen Todd, formerly a factory inspector in Illinois, writes, of the Illinois glass factories: "The mortality of the children would necessarily be very great. The ages of the children employed were as young as ten and eleven years, and the wages sometimes fell as low as \$1.50 a week."

receives now all that it earns, Henry Ford's recent doubling of his minimum wage must come as a shock. Mr. Ford himself is quoted as saying that the wage increase from \$2.34 a day to \$5 (minimum) "is made because the division of profits between capital and labor has not been just."

Will the facts of today bear out the contention of some that each individual can secure for himself a living wage if only he can be "stimulated" to increased endeavor and greater ambition? What has led to the practice of collective bargaining but the bitter experience in the fallacy of this very theory? The "speeder" doubles her output, and for a time doubles her pay. Then the rate of pay per piece is reduced, and she is no better off than originally. All in the shop who cannot equal her speed are poorer. But to go deeper still,—in most industries the greatest possible "stimulus" to endeavor is already applied, the stimulus to secure by the worker's utmost exertion a wage which will purchase the barest necessities of life.

In the silk mills of Paterson the workers have been required to tend two, then three, then four looms. So that they might double and quadruple their wage? Not at all; merely that they might receive the same wage, which the increased cost of living makes actually a lesser wage.² In the sweat-shops of New York the worker has been speeded up until the limit of endurance for a continued period or a prolonged life has been overstepped.

In the clothing trades it is a frequent thing, when a girl is asked if her father works, for her to reply, "No, he is old; he cannot work any more."

"How old is he?"

"Fifty. He's all worn out. He worked so hard when he was young. He can't keep it up any more."

In individual instances and for a time, no doubt, increased effort means an increased wage, a living wage. But for industry on the whole and in the long run, for the rank and file, does not Morris Hillquit come nearer the truth about wages: "The working population as a whole gets just a little less than is absolutely necessary to maintain it in physical fitness for its task, and to enable it to reproduce the species worker?"

One of the interesting speculations in regard to minimum wage is its probable effect on immigration. It has been asserted that it will attract to America

²In an article on Making Silk, in the *International Socialist Review* for March, 1914, Ewald Koettgen gives figures and data from which he deduces the following statement: "In other words, a weaver produces 18 yards more per day and is paid \$1.05 less than before." The comparison is between work and wages today—and in 1908.

great numbers of the unskilled workers from the poorer classes of Europe. But the lure of fabulous wages is already operative in southern Europe, enhanced to its utmost capability by agents of interested companies. It seems as if the establishment of a mere minimum might be a negligible stimulus to over-immigration as compared with the tremendous and artificial stimulus which steamship companies, mine operators and employers of cheap labor now exercise. If we want restricted immigration the power to restrict is ours at any time. To resort to the indirect method of starving our workers so that America shall look undesirable to the poorer classes of Europe, seems an ill-considered method of restriction. But so far from stimulating increased immigration, the minimum wage seems capable of itself acting as a restriction. For, if a fair wage is com-

pulsory, employers will have no motive to induce cheap immigration, and a powerful artificial stimulus, now acting, will be removed.

But, all these minor considerations aside, one has to come back to the main question of justice and expediency,—what a civilized nation should do and what it cannot afford to do.

Either it is desirable that all who work be given enough of the wealth they produce to live on, or it is not. If it is, there are three ways in which it may be accomplished: The universal strike of the employed, universal agreement among employers, a universal regulation by government. Of the three methods which seems at once most probable of accomplishment and capable of inflicting the least harm in process of adjustment?

HOW EUROPE PROTECTS BLEACH WORKERS—HOW NEW YORK DOES IT—BY GEORGE M. PRICE, M.D.

[The third in Dr. Price's series of European impressions.]

AMONG THE electro-thermal and electro-chemical factories at Niagara Falls, N. Y., are many in which there are great dangers to the lives and health of the workers. Not one of the chemical establishments in that city made such a terrible impression upon the members of the New York State Factory Investigating Commission, however, as the bleach works connected with two of the largest chemical plants which they visited in the summer of 1912.

In my report to the New York State Factory Investigating Commission on the chemical trades, (published in their second report, 1913) the conditions in these factories were described in detail. The bleach workers rake up the chloride of lime (or lime saturated with chlorine gas) spread on the floors of large air-tight chambers and throw it down chutes through traps in the chamber floors. The chamber is supposed to be ventilated before letting in the workmen, although considerable chlorine gas is left in the chamber and the process raises clouds of dust. The chlorine gas is so overpowering that it is impossible for one to stay in the chamber for even a short time without some protection. The workers wear a "muzzle" of several folds of cloth through which they breathe.

The men remain in the chamber from ten to fifteen minutes. When they come out they present a pitiful appearance. They are covered with lime dust; their eyebrows and exposed parts are permanently whitened by the action of the bleach; perspiration is profuse and runs down the face; the breath is labored and hurried; the pulse is high; and the exhausted workers quickly throw off their muzzles and rush for the open windows gasping for breath.

Dante, had he lived in our age, need not have gone far to draw pictures of his "Inferno," for, if there ever was a hell in which human beings were condemned to suffer and expiate somebody's sins, the bleach chambers are certainly such. The work in the bleach

chambers is most exhausting and can be performed only by extraordinarily robust men in the prime of life and then not for long periods. These men at forty look as though they were sixty and their tenure of work in these chambers is not very long.

I asked the superintendents and owners of the establishments whether they knew of any other process by which chloride of lime could be manufactured without such great hazards to the lives and health of the workers. Invariably, I was answered that they knew of no such process.

BLEACH PACKERS' REGIMENTALS

Packers of "bleach" or chloride of lime wear several thicknesses of moistened fine white flannel over their mouths and draw breath only through this. Castner Electrolytic Alkali Co., Niagara Falls, N. Y.

While going through the large chemical establishment of Droegenbush, near Brussels, on my recent tour of inspection, I was shown a great number of practical improvements in the manufacture of acids and in other chemicals by the superintendent of the works. Just before leaving the establishment we passed an open shed with two workers, one on each side of the shed. The whole process was so inconspicuous that it would have escaped notice if I had not asked the superintendent, who accompanied us, what was being done in the shed. I was greatly surprised when I learned that the work being done in this part of the establishment was the manufacture of chloride of lime. "Where are the bleach chambers and where are the bleach workers?" I inquired. "We need no bleach chambers nor do we need any bleach workers," he replied. "This is an improved process of manufacturing chloride of lime by which a larger quantity is manufactured with less expense. As you see there are only two workers necessary, one at each end of the process."

On closer inspection I found that the whole process of bleach manufacture was done in a surprisingly simple manner. It is unnecessary here to describe the details of this improved process. It is sufficient to say that the slaked lime is drawn through a vacuum pipe into a lime hopper on the top of the machine; from there the lime is dropped into a special cylindrical apparatus consisting of several superimposed cast-iron cylinders in which are worm arrangements carrying the lime along while chlorine gas passes over in an opposite direction until it finally comes to the outlet shoot, which, when opened, lets out the saturated lime, now chloride of lime, into a packing cask which is then headed up and ready for shipment.

The whole process was automatic and entirely closed; there was hardly any smell of chlorine gas in the vicinity and the two men, one at each end of the process, did not need any protection whatever as there was no dust or gas present from first to last.

Here then was an illustration of the practicability of preventing the dangers and injuries to which bleach workers are subjected. Why is it that our manufacturers at Niagara Falls did not know, or claimed they did not know, of such a process?

My elation in having discovered a new process in manufacture of bleach powder was, however, short-lived, for, on further study and inquiry I have found that not only is this process of bleach manufacture not so very new, but it is one that has been employed in the Rhenania factory at Aachen, Germany, for a great many years. It is called the Hasenklever process. On looking over some old English factory reports I found a description of this process with photographs, etc., as well as a description of another similar process, that of Mr. Milnes, fully described in the report of the chief inspector of factories in England in 1893.

The moral of this tale? Ignorance is not always bliss; at times it is a crime.

SWEDEN'S NEW LAW FOR THE PROTECTION OF WORKINGMEN—BY OLGA S. HALSEY

SWEDEN IS LEARNING from the experience of other nations to prepare for her coming industrial era. Although in 1904, agriculture was an industry of greater magnitude than all manufacturing enterprises combined, the development of her water power indicates the dawning of an industrial era. In anticipation of this change a new factory act was passed in June, 1912, and became effective January, 1913.

The first impression that this "law for the protection of workingmen" makes upon the readers is that its provisions are indefinite. The law aims at results, and has left the interpretation of the terms to inspectors. The inspectorial force meets regularly, so that a uniform interpretation may be maintained. The indefiniteness is particularly noticeable in the sections that aim at the prevention of industrial accidents and diseases. For protection in case of fire, "such steps shall be taken as may be regarded necessary considering the nature of the work, the location of the place of work, and the number of workers."

To maintain general good health, the law requires that escaping dust, steam, and gas, shall be prevented, and that factories shall be adequately lighted, heated and ventilated "to the degree that the nature of the work permits."

A novel regulation is that the duration of employment of those working in an unhealthy trade, shall be limited. The only instance, in which this appears to be in force, is in the use of white or yellow phosphorus for match-making. The law of 1896, which covers this special industry, provides that those engaged in the preparing or dipping of matches may not be so occupied for more than one month; they may not be re-employed until after the expiration of four weeks and then only upon the condition that the health of the worker has not suffered. Every three months, at the expense of the employer a medical examination is given.

The law contains no limitations of the hours that men may work. More protection has been extended to the 58,000 working women, who may not be employed underground, in quarries, nor at night work, nor within 6 weeks after childbirth unless the doctor testifies that without danger to her health she may resume work earlier. There seems no immediate prospect of attaining a ten hour day for women, because the feminists, with shortsightedness, oppose restrictions upon women alone and because the unions devote their energies to working toward an eight hour day for both men and women.

The law has made its greatest restrictions in the employment of the 59,414 children, or minors under eighteen. The first requirement is that the minor shall have finished the public school. This is strengthened by a carefully enforced compulsory education law which requires attendance at school from seven years until the completion of the course. The public school system is so managed, that practically all finish school at twelve,

Miss Halsey is a recent graduate of Wellesley College and is now a student in the London School of Economics. Under the general direction of Prof. Katharine Coman of Wellesley, Miss Halsey is taking advantage of this opportunity to observe social conditions in Europe.—Ed.

thirteen, or possibly fourteen. Boys under thirteen, and girls under fourteen may not begin work. These regulations apply only to those work places that are defined as "factories" (i.e., where there are ten or more employees; five or more employees, and three or more horse power; or places with five horse power or more). Places smaller than these are called "shops." As these "shops" frequently carry on light work, often out-of-doors in the northern provinces, age standards have been lowered, so that boys of twelve may be employed for six hours a day.

Before a child may begin work he must have his certificate book. In this the parish priest certifies that the child has fulfilled the educational requirement, and gives the child's name, age, parents' name, and address. After a child has begun work his hours are limited according to the following table:

Under 13.	6 hours a day.	30 hours a week
13 14	8 " " "	48 " " "
14 18	10 " " "	60 " " "

With a few exceptions minors may not be employed between the hours of 7 p. m. and 6 a. m. No child may be employed at work that is especially dangerous, such as mining, or which may prevent his physical development. To insure this the law provides that each minor under eighteen at the expense of the government shall have an annual medical examination, to determine how far the work may have injured his health. The results are recorded in the certificate book, which has pages specially arranged for the purpose.

If the occupation has been injurious to the child's health, he is not allowed to continue. In 1911, 37,971 out of the total 59,414 working children were so examined (63.9 per cent); 501 were assigned to lighter work, and 81 forbidden to continue work. The results of these examinations are available for statistical purposes when the books of the eighteen year old boys and girls are returned to the Social Board.

In the management of her inspecting force, Sweden has solved her problems in an individual manner. With a total inspecting force of 48 it is impossible to inspect annually all the 20,371 registered factories. In fact, in 1911, only 2,596 or 12.3 per cent were inspected. Although the inspectors need a larger force the Riksdag is unwilling to grant money for the increased salary expenses. The present law aims to meet this difficulty by requiring that inspections are to be made first of those plants which have shown a high rate for accidents, or industrial diseases. Where such dangers

are at a minimum an inspection need not be made. The policy of the inspectors is to persuade rather than to compel the manufacturer to introduce necessary improvements. It is only in extreme cases that they resort to police authority to close the factory until alterations are made. This was done in about eight cases in the first half year in which the law was in operation.

One of the marked changes of the law, is the provision that one of the chief inspectors shall be a woman, charged with the oversight of women and children in industry. Kerstin Hesselgren, who has been appointed to fill this position, hopes to secure the complete supervision of the garment and laundry industries, which employ largely women.

Through a special force of communal inspectors, the act provides for the inspection of the small "shops." The local board of health, the communal board, or specially appointed persons, may be selected to undertake this work. In theory, the chief factory inspector supervises the reports of the communal inspectors within his district. Whether this supervision is to be lax, or systematically rigid depends wholly upon the individual inspector. Success demands close oversight. This is a most significant attempt to provide for the supervision of these small work places, that everywhere have been the despair of inspectors.

A SURVEY OF SOCIAL PROGRESS

The executive committee of the national survey of social progress which the National Civic Federation is to undertake has announced the selection of Roland P. Falkner as director of the survey. Mr. Falkner has had a wide experience in the statistical field. He was instructor and later assistant professor in statistics in the University of Pennsylvania from 1888-1900. He was chief of the Division of Documents in the library of Congress from 1900-1904; commissioner of education in Porto Rico for the three years following. Afterwards he was connected with the Immigration Commission, and since 1911, has been assistant director of the United States census. Mr. Falkner was statistician of the Senate Finance Committee in 1891 which made a federal investigation into prices, secretary of the International Monetary Conference in 1892, and chairman of the United States Commission to the Republic of Liberia in 1909.

BIRMINGHAM STRIKE SETTLED

Through the intervention of Sir George Askwith, of the British Board of Trade, the strike of the unskilled iron workers in the vicinity of Birmingham, England, has been settled. After eleven weeks on strike, the men have obtained their principal demand for a minimum wage of \$5.60 a week. Some 36,000 men were involved in the strike—members of the National Union of Gas Workers, the Amalgamated Iron Workers, Brickmakers, General Labourers, and The Workers' Union. The loss in wages was approximately \$1,330,000.

SOCIAL AGENCIES

HOMES FOR YOUNG WOMEN: THE ELEANOR CLUBS OF CHICAGO—BY ANNIE MARION MACLEAN

TIMOTHY'S QUEST for a mother was a simple and innocuous pastime compared with the young girl's search for a home when an unfriendly fate thrusts her out of the one nature designed her to have, and sends her scurrying around a big city looking for work and a place to live. Work may be obtained, but where shall she lay her head? The work may not be very profitable as work goes; it may not pay her more than five or six dollars a week, a mere pittance, where bread and butter are dear. There are doors ajar for this young girl, but the glimpse within is disheartening, and she is wise to pass them by even in utter desolation. But she is fortunate not to find worse things than dreariness and dirt.

Young girls are poor judges as a rule, and are likely to accept things on their face value. It seems too bad therefore that they should be obliged to go home-hunting so early in life in the great and insincere city. People who love girls have felt this, and some have come to the rescue with homes of various kinds spelled with a capital H. Many are probably good, and the sponsors are offering their quota to the blessedness of the world.

I have in mind now, not the homes whose name is legion, but one particular kind that seems to be filling a want in the great western metropolis, the Eleanor Clubs of Chicago, which have long since passed the experimental stage. Just so sure as Timothy found a mother at the end of his quest, the young girl who works in Chicago will find a home with a small h if she pursues her quest as far as the chain of buildings skirting the industrial parts of the city, and bearing on a simple door plate, the magic words "Eleanor Club." There are six now, with a seventh in sight, and as the Englishman reported of colleges in Ohio, they are always pulling stakes for another.

This work was started fifteen years ago, by a woman then scarcely more than a girl herself with the grace of God in her heart, as they still say in the country districts, or, as the more sophisticated city folk would put it, she longed to help bring about the brotherhood of man or the sisterhood of woman. She sought a new heaven on the old earth, for what is a good home for young women but a bit of heaven brought down? The first club has been in operation fifteen years, and this is the gala year in the organization's history, since a wonderful new house is being opened in a densely peopled industrial area, away on the northwest side of the city. This is designed to accommodate a full hundred and to serve as a

INA LAW ROBERTSON
Founder of the Eleanor Association

neighborhood center for non-resident girls.

There is also a summer camp, as well as a downtown club and social center, all operated by the Eleanor Association, but getting their inspiration from one woman, Ina Law Robertson, without whose organizing power and generosity, they would never have achieved their present success. Other philanthropically disposed people serve as directors and on committees, but the brunt of the labor has always fallen on the founder. And it is no small task to keep six houses going, not to mention summer camps and other things, such as providing an interesting and wholesome life for about 2,000 girls in the run of the year.

The association, heretofore has not been a house-owning body, preferring, for some very good reasons to lease property. But two exceptions have been made recently, and for equally good reasons. The association now owns the camp grounds of ten acres on the wooded shores of Lake Geneva, Wis., and a new house recently opened.

The plan of organization always has been to equip a house to accommodate at least sixty guests, but in some cases over a hundred are cared for, the basic principle being that there must be a number sufficiently large to make the place self-supporting, but not large enough to make it appear institutional. Opinion will always differ as to the ideal number, some claiming that it must be at least

forty to meet expenses in a large city, and never over fifty, if the reality of a home is to be preserved. This is the plan of the Girls' Friendly Society houses. But the Eleanor clubs are ordinarily larger than this, and yet homelike.

This work is in no sense a charity except that a great deal of time and thought are given to it by several people who have no other occupation in life than doing good. Young women who are wage-earners do not want charity of the material kind, but they are most grateful for good homes in which they pay their way. And they do pay their way at the Eleanor Clubs at the rate of from three to five dollars a week, according to the accommodation they desire or can afford. They can live, after a fashion, for such sums in any city, but not usually in ways that keep body and soul together, at least not on friendly terms with each other for very long.

Each club is in charge of a liberal-minded superintendent, with the necessary housekeeping and clerical assistants. Experience has shown that a fund of a few hundred dollars must be advanced to meet the exigencies of the first month or two after occupancy. After this each club can pay not only its own way, but its debts. The income from guests covers all the expenses of the clubs, including interest on the sum spent for furnishings, and advanced in most cases by the founder. This interest is turned over to a fund for the benefit of sick and needy girls, a form of help that may some time be necessary to people in almost any walk in life.

The average girl on a low wage may get along when she is in health with the many economies she knows so well how to practice; but when she falls sick or is out of work, things are very different. It is then that her soul as well as her body needs help, and what better first aid to the financially injured than a benefit fund? Employers' organizations and some employers make provision for such emergencies, but the overwhelming majority of young girls who work are out in the cold so far as such ameliorative influences are concerned, and need some other kindly providence.

It will readily appear that the Eleanor Clubs are much more than mere life-saving stations where board and lodging may be purchased at low cost. They aim to provide all the essentials of health and happiness. There are classes of various kinds organized to meet the demands of the young women, but they are not urged upon them, the theory being that bodily relaxation may be better sometimes than learning when the two cannot go together. But for those who enjoy evening work, there are classes in physical culture, dramatics, choral work, and foreign languages. And for all, by way of relaxation, are

ELEANOR ASSOCIATION SUMMER CAMP, LAKE GENEVA, WIS.

One hundred girls at a time can enjoy a two weeks' outing in these ideal surroundings, seventy-five miles from work

small dances, musicales, and all sorts of interesting parties. Especially is the latch-string out on Sundays to young women strangers in the city, and they are all cordially invited to stay to tea.

The clubs recognize the fact that young girls with very little money must have laundry and sewing done at small cost, and therefore privileges for such work are provided. They may use the laundry at the rate of five cents an hour, and sewing-machines are free. Thus it happens that evenings and Saturday afternoons are more likely to have exhibitions of Hebe at the washtub than of Minerva at the dictionary.

The down town club rooms in connection with the office of the Eleanor Association are full of interest every day in the week, but especially on Sunday afternoon, when there is a stimulating address, good music and a reception. This opportunity is highly prized by those who attend, and this means any young women who wish to go. Many use the rooms as a place of rest or for meeting young men friends during the week, and such use is hospitably urged.

Since eating and sleeping and working in the gloomy city are dull tasks at best, it is to the country that girls must go to see the festive side of the Eleanor Association. It is on the shores of Lake Geneva, Wis., seventy-five miles from Chicago, that the summer camp is located. The inception of this camp was the contribution of a young woman who had never known the enveloping gloom of monotonous labor, and had never had to wonder how a summer outing could be managed on an empty purse. The camp has grown apace since it was started four years ago, and now has several buildings, many tents and a good system of sanitation, all on its own land.

A hundred girls at a time can enjoy a two weeks' outing in ideal surroundings. The camp is self-supporting, and is managed from the central office like the other clubs, except as to its internal affairs, which are in the hands of a successful superintendent. The charges here are \$3.75 to \$4.75 a week for a tent bed, good food, and the great outdoors with all its charm. There is also a recreation tent, full of fun when the outdoors palls, as it is sure to do at times with the average city worker, when she lets her mind

revert to the glamor of indoor lights and sounds.

The Eleanor Association would justify its existence if it had never done anything more than maintain the summer camp. But it has done much more than this, much of course that can never be estimated, but some things can be written down that those who come after may have an example. When club seven opens its doors, there will be bed and board and home, costing from three to five dollars a week, for about 600 young women who work hard all day, and need all three, if life to them is to be more than meat and the body than raiment. In addition there is the down town center before mentioned which has a procession of scores a day marching in and out, and finding relaxation and pleasure.

It is an achievement to have done this in fifteen years, with most of the ex-

pansion during the last five. Expert business administration is the secret of the success of the enterprise. Busy young workers alone could never provide such homes for themselves, because they have neither the time nor the knowledge, and seldom the talent or power of initiative, and they could rarely control the funds necessary to make a start.

The Eleanor Clubs have helped to make a real home for thousands of girls, as the years have passed, and the total sum upon which interest is paid—interest that goes into a sick benefit fund, is less than some American women have paid for a string of beads. Each one to her taste, of course, but most of us—thank God!—would rather use the money, if we had it, in buying a case for jewels like unto Cornelia's, or in founding Eleanor Clubs with their camps and other bits of glory.

PRISONERS: SOME OBSERVATIONS OF A BUSINESS MAN—BY ADOLPH LEWISOHN

CHAIRMAN EXECUTIVE COMMITTEE, NATIONAL COMMISSION ON PRISON LABOR

IT SHOULD BE our aim to improve conditions in all our prisons. Men who are free can either singly or by co-operation with others protect their rights and see that they are treated fairly and properly, but such is not the case with prisoners, who cannot protect themselves or secure fair treatment through their own efforts. It seems therefore to be the duty of every fair-minded man to see that in their helplessness they are not subjected to injustice and oppression.

After a person has been found guilty of a punishable offence, the first thing is to determine the penalty or pass sentence. I think that in a great many cases the prison sentence should be omitted entirely, especially for first offences, the judges or magistrates to have the right in their discretion to suspend sentence of imprisonment altogether. There are many cases of which judges say they would prefer not to impose sentence, as they think it would be better that the offender should receive a warning only. By giving him another chance they feel he might become a good citizen and not repeat the offence, while sending him to prison might make him a great deal worse or even result in his becoming an habitual criminal.

I believe it is only about half a century ago that people were put in prison for debt, and I think in some places in Europe that is still done. This added greatly to the amount of imprisonment and certainly did not improve the prisoners; on the contrary, it made them lazy, indifferent and in many other ways did considerable harm. As a matter of fact, although imprisonment for debt has been abolished in this country, there are no more failures than formerly; in fact, I think there are fewer.

The First Offence

Two offences occur to me in respect to which it might be better not to imprison first offenders. In cases of petty larceny I think the law could be changed so that those who are guilty of this crime would, for their first offence, be compelled to make restitution of the amount taken and then dismissed with a reprimand. That is, there should be no imprisonment for such offences, only for a repetition of such offence.

Another is the offence of false representation. I presume a great many people have been imprisoned for this offence. While this is, of course, punishable, it is quite a natural and com-

mon thing for people in business, especially the smaller business men, when they find themselves in financial difficulties, to try to stretch a point.

I know it is the experience of many banks, in most cases where they have suffered losses through failures, in looking over the statements which furnished the basis of credit, to find that most of these failures are what might be called "crooked." That is, where statements were demanded before extending credit the statements are found to be false. The banks do not usually prosecute these offenders as there is not much to be gained by doing so, but try rather to make a settlement with them.

I have no statistics, but I suppose throughout the United States there have been a large number of people imprisoned for making false representations previous to failure, and there are a great many who have committed the same offence but have not been prosecuted at all. Perhaps the law in regard to this particular offence could be modified so that punishment could be effected in another way and the ends of justice nevertheless attained.

Prison Sentence

I would like to see the length of sentence usually imposed greatly reduced, say on an average cut in half. I think there should be a further reduction of time for good behavior, up to say 50 per cent of the total sentence, such commutation to be based upon different degrees of good conduct. In my opinion, shorter terms would be more just and equally efficient in preventing crime, and besides would reduce the number of prisoners to about 30 per cent of the

number now incarcerated and make the problem much easier to handle. With fewer prisoners it would not be necessary to have more than one prisoner in a cell, the prisons would not have to be so large, it would be easier to make conditions in them more sanitary and the cost to the community would be greatly reduced.

The question of indeterminate sentences should also be thoroughly inquired into. I believe that for a certain period the discharged prisoner should be under supervision, but there should be some limitation to such supervision, as otherwise he always has the consciousness of something hanging over him, and that naturally interferes with his normal life. The sooner he gets back to natural living and feels that he is the same as other citizens the better, and this is hardly possible while he has the fear of some one standing over and watching him.

Behind the Bars

Next, as to the treatment accorded the prisoner after he is incarcerated.

All penal institutions should be made perfectly sanitary, and I hope I do not shock anybody in saying that they should also be fairly comfortable for prisoners. While the greatest simplicity should be exercised, everything ought to be done to keep prisoners healthy in body and mind. They should be given regular employment and the strictest discipline maintained, with the idea of making the punishment of the prisoner consist more in his forcible detention than in hardships during imprisonment. The average person values his liberty and does not want to be deprived of it even

though he receives humane treatment during his incarceration.

I do not think that many criminals are deterred from committing crime by the knowledge that they will be badly treated during their imprisonment, nor do I believe that an increase in crime is likely if prisoners are accorded fair treatment. At any rate, we can take our chances as to that. Unless we carry out a humane policy we are going back to the old idea of torture which was practiced in the Middle Ages.

In Russia the treatment accorded prisoners is very harsh. There are long terms for what we consider comparatively slight offences and prisoners suffer great hardships. That has not decreased crime in Russia; in fact, I think statistics will show that there are more offences committed against society there than in other countries, like ours, where the laws are milder.

What we should aim to do is to try to improve the prisoner so that there will be some chance of his becoming a better man and a useful citizen when he is liberated. I hope that we may gradually reach a state where the number of people in prisons will be greatly diminished. It seems a pity that we are compelled to keep such an army of men and women in prisons in order that the rest of the people may be able to live in safety.

Prison Dress

I think that stripes, or any special prison dress that brands the prisoner, should be done away with. It might, of course, be well to have the prisoners dressed so that they can be distinguished, but not in a way to make them feel degraded. We have, for instance, a special dress for certain public employes, such as letter-carriers, policemen, and others, but as far as prisoners are concerned, my idea would be to do away with anything in the nature of branding them either on their person or in their dress.

With further reference to physical conditions, I think the appearance of all forcible restraint, such as prison bars and fortifications, should be done away with and that prisoners should not be made to feel that they are caged up like animals. In other words, notwithstanding their offences against society, convicts should continue to be treated like human beings and the better side of their natures appealed to. A prison should not necessarily look different from any other habitation.

Humane treatment is likely to result in fewer attempts on the part of prisoners to escape; in fact, it is my belief that while every man values his liberty and would like to regain his freedom when he is deprived of it, the many ingenious and desperate attempts to escape are due in a large measure to inhuman treatment which makes the prisoner ready to take almost any chance to get out. It seems to me that the elaborate preparations and safeguards for preventing escape are due to an entirely wrong conception of the proper method of treating prisoners and often in themselves have the effect of making the prisoner want to get out at any cost.

Another point to be considered is the

PYGMALION AND GALATEA AT A SETTLEMENT

The crowning work of the year by the Dramatic Association of Greenwich House, New York, was the presentation of *Pygmalion and Galatea*. Writing of it in the settlement's annual report, Marion Curtiss shows that the attempt to come up to the high standard demanded had a marked effect. It gave a definite idea of team work, of "house" pride and self-confidence. It brought forward boys and girls who had lingered in the background, and it created so strong a demand for dramatic work on educational principles that a trained teacher has been provided.

brutalizing effect which harsh and inhuman treatment of prisoners has on keepers and wardens. From reports in the papers it seems that for the slightest offences prisoners are punished, especially those let out to contractors as it enables the contractors to get more work out of them. The wardens and keepers have practically all power and the prisoners practically no redress or very little if any. Quite an army is employed in guarding and looking after prisoners. If they have to treat these men, who are at their mercy, in the right way, if dark cells and lashes and other cruel punishments were abolished and humane treatment accorded the prisoners we would not be brutalizing this great army of men who have them in charge.

Every prisoner should of course have a reasonable number of hours of occupation provided for him, so arranged, if possible, that it would not come in competition with outside labor. I think that prison labor under contract is very apt to be abused. First, it is unfair competition to business which has to pay regular wages, but the particularly bad feature of it is that contractors are apt to either directly or indirectly overwork prisoners and otherwise misuse them for their own personal advantage.

It would be well, wherever it can be done, to have prisoners employed on farms. The influence of direct contact with nature is very good, and the product of prison labor employed on farms would not disturb other business. Even if it should happen to reduce the cost of farm products it would to that extent help towards the cheaper cost of living which is so much desired. At any rate,

part of the products thus raised could be used in the maintenance of the prisoners themselves.

After the Discharge

When the prisoner is finally discharged he should be helped in getting employment and not left to the danger of relapsing into lawlessness through idleness.

Of course, the question of the segregation of prisoners into classes is an important one. Obviously, those who are guilty of comparatively slight offences should be kept apart from those who are guilty of more serious offences, or from those who are apparently incorrigible. That, however, is a matter upon which every one agrees and only needs careful observation and judgment to put into effect.

With reference to what I said at the beginning, that fair-minded people should protect the prisoner in his helplessness, I think it would be an excellent thing if committees were formed in different communities to keep in close touch with conditions in our prisons with a view to seeing that fair and humane treatment is accorded to this class of unfortunates and to study the whole question of the best way to handle the problem. The criminal should be regarded by society not in the spirit of enmity but rather as a defective which he undoubtedly is, and every effort should be made to bring him back into a normal state.

The prisoner should be paid for his labor. Part of it should be used for his maintenance and part for the support of his family. When he is discharged, employment should be provided and opportunity given him to lead an honest life.

OHIO CHILD WELFARE DEPARTMENT—By Hastings H. Hart

THE OHIO Board of State Charities is making encouraging progress in the development of its new Children's Welfare Department, under the Ohio Children's Code. The Board of State Charities selected as director and assistant director, C. V. Williams, superintendent of the New Jersey Children's Home Society, and Esther Faton, of the Department of Child helping of the Russell Sage Foundation. The Children's Welfare Department is responsible for the supervision of institutions and societies caring for dependent, neglected and delinquent children, and will ultimately be responsible for the placing-out of children committed to the care of the Board of State Charities under the Children's Code.

At the outset some difficulty was experienced because the representatives of the children's institutions of Ohio, especially the county children's homes, were uneasy lest their interests should suffer in the administration of the new law.

A special conference of superintendents and officials connected with institutions and agencies caring for dependent and neglected children, was held at Columbus under the auspices of the Board of State Charities. This was a very representative gathering. After the free discussion the conference adopted resolutions in which they favored the fullest co-operation with the Board of State Charities; confidential registration by the State Board of Charities of all children cared for in institu-

tions; state inspection of child-helping institutions; use of county children's homes for the temporary care of children whose parents are in temporary distress, with the proviso that such parents should pay board when possible; placing of children who are absolutely dependent in family homes as early as practicable, but with the exercise of the utmost care in the selection of foster homes; obtaining complete family histories as an indispensable guide to dealing with dependent children; careful physical examination to discover the needs for medical and surgical care.

The conference reaffirmed the principles adopted by the White House Conference in 1899. It promises well for the efficiency of the new code.

THREE SCORE YEARS AND 15 OF STATISTICS

THE SEVENTY-FIFTH anniversary meeting of the American Statistical Association, recently held in Boston, was noteworthy for the messages which came from foreign delegates several of whom were in attendance. The papers and addresses were appropriately devoted to the main to a review of the achievements of the past and an emphasis upon the services which statistics may render to science, business and government.

Particular interest attached to points raised by S. Rossiter in speaking of the work of the federal government. He showed that twenty-nine different government bureaus devote a part of their time to the collection of various kinds of data and he held that in the establishment of the permanent census bureau, the independence and authority of the census office had been sacrificed. It became a part of the regular system of government bureaus, with the consequent delays and diffusion of authority. He contended that the work of the thirteenth census had thus been hindered and rendered less effective than the previous ones.

The increasing service of statistics to the social sciences was emphasized. Prof. Franklin H. Giddings for sociology, and Prof. David Kinley, for economics, showed how these studies are becoming more scientific because of the application of statistical methods and how social legislation is being founded on fact instead of theory.

Prof. Walter Wilcox discussed the training of the statistician and declared that the student should acquire knowledge of statistical method not only in lecture rooms but by experience in an official statistical office. The late Carroll D. Wright, he said, did much to develop a group of American labor statisticians while he was in charge of the Bureau of Labor, and in this same manner William Farr trained men in England and Ernest Engel in Prussia.

The officers elected for the coming year are president, John Koren of Boston; treasurer, S. B. Pearmain of Boston; secretary, Carroll W. Doten of Boston; assistant secretaries, E. P. Secker, of Washington and R. E. Chad-dock of New York city; editor, William B. Bailey of Yale University.

HOSPITAL SOCIAL SERVICE AND RELIEF SOCIETIES

At a recent meeting of the New York Hospital Social Service Conference steps were taken to bring about closer co-operation between the medical social service departments of New York city and agencies which provide relief. The meeting was called to consider the standardization of hospital social service in New York city and the discussion brought out sharply the divergent

THE LARGER CHARITY

McConnellsburg, Pa., has 597 people. House rents average \$60 a year. The streets are lighted by oil lamps. From a spring on the mountain side, the village water supply is piped.

A leisurely stage furnishes transportation to the railroad, ten miles away. There is no almshouse, no poverty. When accident, sickness or shiftlessness make life difficult for some, the neighbors or the village sewing circle help.

New York city has ten thousand times more people than McConnellsburg. Its problems are infinitely more complex. They must be met with invention, organization and vision—electricity, twelve-story apartments, subways, Croton aqueducts.

McConnellsburg methods will not solve transportation and congestion for New York, nor can our poverty be met by the haphazard kindness of its sewing circle. Our social problems demand administration, broad human sympathy and constructive vision—the type of mind that plans Hudson tubes and Brooklyn bridges.

This is the ideal behind the Charity Organization Society—applying to an enormous task the best that modern progress affords. It is the larger charity.

—From the weekly "Bulletin" of the New York Charity Organization Society.

points of view which have made co-operation difficult.

Frank J. Bruno of the Charity Organization Society, reported that the relief societies were unanimous in their willingness to co-operate and that the societies found their relationship with the medical social service departments satisfactory. Dr. Alexander Lanibert, on the other hand, revealed a wide divergence both in the practice of the social service departments in seeking co-operation with relief societies and in their estimate of the results which are obtained.

The divergencies came out sharply in the discussion. Dr. Lambert had defined hospital social service as "that part of organized charity which endeavors to rehabilitate individuals or families whose need for assistance is in some way due to accident or ill health." There was an evident feeling on the part of the medi-

cal social service workers, explicitly stated by Dr. Sidney Goldstein of the Free Synagogue, that every case involving sickness under the care of a social service worker in which other agencies are concerned should be regarded by all such agencies as under the direct supervision of the social service department.

It was pointed out by Morris D. Waldman of the United Hebrew Charities that the purpose aimed at by hospital social service as defined by Dr. Lambert, has been the function of relief societies since their inception. Mr. Bruno also made it clear that the position of exclusive leadership claimed for medical social service workers involved a readiness to assume full responsibility for the welfare of families in their charge on other sides than that of health.

In spite of the disagreement the conference did not lose sight of the fact that co-operation between the two fields at work is imperative. The outcome of the discussion was that the question was referred to a committee.

WINDSOR, VERMONT, AND ITS COUNTY SURVEY

A social welfare exhibit in a small village, bringing 1,700 people from twelve different communities, the thermometer standing at 25 below zero, sounds like a dream. But this very thing occurred in White River Junction, Vt., several weeks ago. The moving spirit was the Windsor County Y. M. C. A. county committee, whose progressive work has been noticed before in THE SURVEY.

Co-operating with this committee were the local organizations—educational, business, religious, philanthropic, the County Agricultural Association, various state and national agencies. All joined to set forth by charts, models, moving pictures, and talks the subjects and conditions in which each is interested, with all the emphasis placed upon the needs of the town of Hartford.

The school exhibit was as vital as any. What Hartford Schools Have Done, Defects in our School System, and The Future of Our Children were shown on three screens. Conditions in 1907 were contrasted with conditions in 1913—fewer schools and more and better teachers, and old-time buildings replaced by new. Defects also were shown—the waste of non-attendance, and of allowing children to attend in poor physical condition when medical inspection costs so little. And for the future, the demand was shown for more emphasis upon the practical in education. For this section of the exhibit, and one other, all the work upon the charts was done by thirty school boys under the direction of the drawing teacher.

The influence of the social welfare exhibit is already showing itself in new interest and enthusiasm for a better social order, in funds raised for nursing, and in the annual town meeting where a broader attitude toward public questions was evidenced and a higher tax voted. A rural school survey was made in this same alert county of Windsor.

Communications

"SOME INFORMATION FOR MOTHER"

TO THE EDITOR: Some Information for Mother is a classic and should be inserted in school readers throughout the country.

H. M. FINCH.

[Gen. sec., Railroad Department,
Y. M. C. A.]

Rocky Mount, N. C.

TO THE EDITOR: I am much impressed with Some Information for Mother, and am writing to ask if I may reprint it in *American Motherhood*, with due credit to THE SURVEY.

DELLA T. LUTES.

[Editor, *American Motherhood*.]

Cooperstown, N. Y.

TELEGRAM TO THE EDITOR: Would like very much to run in *California Outlook* Some Information for Mother, and will appreciate your securing consent for us. Please wire answer collect.

MEYER LISSNER.

[Editor, *California Outlook*.]

Los Angeles.

TO THE EDITOR: John Palmer Gavit's *Some Information for Mother* is the best exposition of the sex story I have ever seen. I have read volumes upon the subject and it puts the whole thing in those two pages more effectively than most writers do in a good-sized volume.

CHARLES F. F. CAMPBELL.

[Executive Secretary,
Ohio Commission for the Blind.]

Columbus, Ohio.

TO THE EDITOR: I should like to have 100 copies of Mr. Gavit's article, *Some Information for Mother*. I want to distribute them among mothers and donkeys.

JOHN P. PETERS.

[Rector, St. Michael's Church;
chairman, Committee of Fourteen.]

New York.

TO THE EDITOR: Mr. Gavit's article is really an unusually clever example of how one might instill elementary ideas of sex. But the keynote of the whole article is the sentence, "When the child is old enough to ask he is old enough to have an honest answer." If we could only establish that fact in the minds of all the parents and teachers: if we could only make them see that the very shyness of the child would prevent its asking a question that had any double meaning to the youngster, we should have achieved the greatest victory for intelligent sex education. The best that biology can do is to prepare the child to understand the honest answers to its honest questions; and the

best that lecturers in later life can do is to counteract in the mind of the listener as far as possible the effect of dishonest answers.

EDWARD L. KEYES, JR., M.D.

[President, Society for Sanitary
and Moral Prophylaxis.]

New York.

TO THE EDITOR: Mr. Gavit's idea of sex instruction for small folk impresses me as being splendidly done. Of course, it may be difficult for the average parent to find just the right opportunity as "Iconoclast" did. Those of us who are fortunate in living in or near to country life, however, have the same opportunity, and this sketch indicates how easy it would be to instruct our little children properly in these matters.

WM. H. HAGER.

[Hager & Bro., Department Store.]
Lancaster, Pa.

TO THE EDITOR: I like Mr. Gavit's article very much. Children respect simplicity and truthfulness. They don't like a hazy poetical roundabout statement. The attempt to make a fact "beautiful" is often a lazy excuse on the part of the beautifier to avoid clarity. But I don't believe in anticipating the rise of curiosity in the child. Many children develop late. One has to be intimate enough with one's child to know when that curiosity springs up.

MARY K. SIMKHOVITCH.

[Headworker, Greenwich House.]

New York.

TO THE EDITOR: I think we all agree on the necessity of imparting such information. It depends altogether upon who tells it and how it is done. Personally, I approve of the article by Mr. Gavit. A mother of several children said after reading it, "I want to keep that article, it is the best ever."

A. W. BUTLER.

[Secretary, Board of State Charities.]
Indianapolis, Indiana.

CONFIDENTIAL EXCHANGE

TO THE EDITOR: Can you give me space in your columns to raise the question as to whether the term "Confidential Exchange of Information" is the best that can be devised for the central registration bureau to which it has been widely applied?

It appears to me to have two serious disadvantages: In the first place, it tends to convey to the mind of "the man in the street" an unfortunate idea of secret detective service. The first impression is, of course, very liable to stick and not only give undue prominence to a branch of charity organization activity which for every reason should be kept sub-

ordinate, namely, the negative work of detecting fraud and preventing imposture, but also to keep many people from registering their "cases" with the bureau through an unthinking fear of some sort of prying or spying.

Secondly and more seriously, the term is a misnomer. What information the bureau has to give is not real information. It is only the indication of where information can be secured if desired. What would be thought of a commercial or civic information bureau that directed all inquirers elsewhere for the information they came seeking?

If the current name, confidential exchange of information, is infelicitous and inexact, what can best take its place? Social registration bureau has the advantage of being a label that fits the goods, so to speak, but it smacks a bit, perhaps of red-tapery. Social service exchange would seem to have many good points, among them, as has well been stated, that of being "attractive" instead of repellant.

Can your readers suggest a better term?

FREDERICK A. BLOSSOM.

Baltimore, Md.

SOCIAL WORKERS AND ALCOHOL

TO THE EDITOR: Hurrah for you! At last you've got your good medicine and had the sense to print it. May the good work go bravely on and you lead social workers to take the field against alcohol in the most enlightened way. My thanks to the writer in March 21st issue. I am an enthusiastic supporter of THE SURVEY and all it stands for. By the next generation you'll start in on tobacco.

EVA G. PRICE.

Lansing, Mich.

ANTI-PENSION LEAGUE

TO THE EDITOR: Is it not about time for the social workers of the community to organize an anti-pension league with a view of reducing the tremendous annual bill for pensions which retards the development of social work by the federal government, because of the lack of funds? The charity organizations of the various cities and towns of the country could make reports upon the conditions of individuals now receiving pensions with a view to securing the cancellation of pensions to those not actually entitled to same.

R. J. NEWTON.

[Secretary, Texas Conference
of Charities and Corrections.]

Austin, Tex.

BILLBOARDS

TO THE EDITOR: Referring to J. D. Hailman's letter on billboards in THE SURVEY of March 21, I should like to call your attention to another aspect of the subject.

THE SURVEY has from time to time shown an interest in the cost of living. The billboard industry, aside from all its destructive qualities and the fact that practically all billboards are a nuisance, offensive and useless to the general public, is a heavy tax on the people.

SURVEY ASSOCIATES, Inc.

105 EAST 22d STREET, NEW YORK

In a talk before the City Club of Chicago on December 7, 1912, Frank Warren of the Bill Posters' Union said: "In the city of Chicago we have, at a minimum, 30,000 men employed in the printing and bill-posting industries. Multiply that by two, because the families will average two—the children of the men that are married will make up for the bachelors—and that gives us 60,000. There are, then, 60,000 mouths to be fed out of the bill posting industry."

I do not know what the figures may be for the country at the present time but some time ago I saw a statement that there are 8,500,000 lineal feet of boards ten feet high, or about 1,600 miles. It was also stated that \$10,600,000 was invested in hoardings, \$100,000,000 in the allied trades and that the annual cost of such advertising at that time was \$430,000,000, or \$15 per wage-earner.

As I see it, it would be better for the people if the army of men engaged in this work were maintained in idleness, though it would not be so good for the men. The boards we could better get along without on account of the qualities above mentioned. They enable owners to maintain undeveloped land by making the community pay the taxes on the land while they keep it idle.

On the other hand, if this army of men were engaged in intensive agriculture or other constructive work it would be difficult to measure the contrast.

Chicago feeds her 60,000 people and gets worse than nothing in return. The country feeds an enormous army in the same way.

E. T. HARTMAN.

[Secretary, Massachusetts
Civic League.]
Boston.

JOTTINGS**DIRECTORY OF CRIPPLES**

If you should suddenly turn a corner anywhere in New York city and bump into a cripple you will be able to find him, his name, his past physical care, education and industrial training in the registry now being compiled by the Federation of Associations for Cripples. A similar registry for Brooklyn will be made by the Bureau of Charities. A year ago the federation, which includes fifteen homes, schools, and other organizations, started a study of the facilities for their physical care, education and industrial training. As a result it discovered that many cripples are not reached. One estimate of the number of cripples in New York is 25,000. Yet

some of the industrial schools for cripples have vacancies in their classes.

The result has been the establishment of a central bureau and the beginning of the registry, which follows the plan of the London Invalid Children's Aid Association. A permanent shop and exhibit are planned and a periodical, the *American Journal of Care for Cripples*.

MISSOURI CONTRACT LABOR

With sentiment throughout the state against contract labor in the penitentiary, and with a legislative investigating committee working on a new system, the people of Missouri have no hope of abolishing it under two years. It was thought a year ago that agitation against contract labor had been successful but the Legislature was unable to agree on a substitute plan. Recently it let contracts for two years, which affect practically all of the 2,400 inmates, men and women.

The contractors are to pay seventy-five cents a day for eight hours' labor of each prisoner—five cents more than before. The contracts were let to the Ruart Saddlery Co., Star Clothing Co., and Priesmeyer Shoe Co.

CHARITIES CONFERENCE COMMITTEES

Committees on organization, nominations, resolutions and time and place, to report at the Memphis meeting of the National Conference of Charities and Correction, have been announced by the president, Professor Graham Taylor. The appointments are as follows:

Organization: Homer Folks, chairman, New York; E. M. Williams, Cleveland; Ida M. Cannon, Boston; Grace Trumbull, San Francisco; M. J. Tappins, Madison, Wis.; Virginia McMechen, Seattle; Dr. Frank P. Norbury, Springfield, Ill.; J. Byron Deacon, Pittsburgh; Kate Holladay Claghorn, New York; Daisy Denson, Raleigh, N. C.; J. W. Magruder, Baltimore; Rabbi Stephen S. Wise, New York; Wilfred S. Reynolds, Chicago.

Nomination: James Mullenbach, chairman, Chicago; Eva Whiting White, Boston; Robert W. Heberd, Albany, N. Y.; Sherman C. Kingsley, Chicago; Maurice Willows, New York; Aretas E. Kepford, Des Moines; Charles C. Stillman, St. Paul; Ernest P. Bicknell, Washington; Jean Gordon, New Orleans.

Resolutions: Jacob Billikopf, chairman, Kansas City; Adah Hopkins, Grinnell; G. B. Robinson, New York.

Time and Place: Judge G. S. Addams, chairman, Cleveland; Joseph C. Logan, Atlanta; Robert J. Kelso, Boston; Harriet E. Anderson, Louisville; Frank D. Loomis, Indianapolis; A. J. McKelway, Washington; Kate Barnard, Oklahoma; William Thomas, Denver; Minnie F. Low, Chicago; J. T. Mastin, Richmond; C. L. Stonaker, Newark; George B. Mangold, St. Louis; T. J. Edmonds, Cincinnati; Frank E. Wade, Buffalo; Dr. John R. Haynes, Los Angeles; Prof. John M. Gillette, University, N. D.; Robert J. Newton, Austin, Tex.; V. R. Manning, Portland, Ore.; Edwin D. Solenberger, Philadelphia.

WOMEN'S votes in Chicago while not enough to elect any women candidates for the city council, displayed discrimination and intelligence on public questions. They knocked out 946 saloons "down state" and elected many women as township officers. Jane Addams served as a judge of election in her own precinct and Mary McDowell said that the election gave her a sense of a "great new neighborliness." Page 69.

"TEACHING by falsehood" is Dr. Williams's description of much of the "scientific temperance" in school text-books. More's the pity, he holds, with "the steadily rising tide of alcoholism and pernicious cigarette smoking in this country." Page 74.

METHODS of promoting industrial peace were considered at the first week's hearings before the Federal Industrial Relations Commission. There was discussion of protocols, collective bargaining and unions, but the greatest impression was made by a witness who, from his personal experience, interpreted the part that a "third man" can play in labor disputes. Page 71.

LIFE insurance as a business of state government is now in operation in the United States. Wisconsin's experiment leads the way. The first policies were issued last fall. State and county officials are authorized to handle applications and premiums, thus saving cost of special agents. Page 72.

SEX hygiene education for college and normal school girls is now furthered through a Y. W. C. A. traveling lecturer. Page 76.

POLLUTED water in Mikveh baths in New York tenement basements is a health menace. Page 77.

A "philanthropic pilgrim's progress" was the feature at the first birthday party of the Cleveland Federation for Charity and Philanthropy. It showed how Mr. Citizen journeyed from disorganized benevolence to a clearing house plan which brought more money and more givers. The average is now \$1,000 a day and the goal \$400,000 this year. MAKE Civic Club day your shopping day —this slogan has rallied out-of-town shoppers for social welfare discussion at luncheons of the Sacramento Civic Club. Page 69.

GUNMEN grew in city streets. Does New York's west side wilderness of asphalt provide fertile soil for a new crop? Hine's pictures show how boyhood lawlessness is merely play unprovided for. Page 80.

PHILADELPHIA'S Health Bureau gets reports on home conditions of hospital patients. Sometimes it means a concerted attack by a hospital social worker, a relief agency, doctor, nurse and sanitary inspector before conditions can be righted. Page 78.

Russell Sage Foundation

Among School Gardens

By M. LOUISE GREENE, M. Pd., Ph. D.

A terse and practical book which seeks "to instill in children a love for outdoor work and such a knowledge of natural forces and their laws as shall develop character and efficiency."

It describes in easy style, free from technicalities, the best school gardens in all parts of the country, and gives clear instructions for planting and pruning.

Not alone for teachers and children, but for all who would make their own oats, peas, beans and barley grow.

380 pages, 98 illustrations, 15 plans. Price postpaid, \$1.25.

COMMON WELFARE

THE PROBLEM OF POOR LUNGERS WHO GO WEST

NINE SOUTHWESTERN states have joined in an effort to secure federal legislation to provide hospitals for consumptives without means who come from other states seeking health. The constant influx of such persons, for whom support and care must be provided, constitutes a problem which, the advocates of the legislation contend, is interstate in its proportions and properly one to be handled by federal authorities.

At the request of the Southwestern Tuberculosis Conference, Governor Colquitt of Texas organized a committee of ninety-nine, the members being appointed by the governors of Arizona, California, Colorado, Kansas, Nevada, New Mexico, Oklahoma, Texas and Utah. This committee stands sponsor for the Shafroth-Callaway bill now before Congress.

This bill provides for the use of abandoned military reservations and other government property in the Southwest for tuberculosis hospitals for indigent consumptives, the hospitals to be operated under the direction of the United States Public Health Service and the regulations for the administration of the institutions to be issued by the secretary of the treasury. The bill also provides that the United States Public Health Service Hospital at Fort Staunton, N. M., may be used for any indigent consumptives who "have contracted their infection in another state and who by reason of their affliction are a menace to interstate commerce."

The advocates of the bill urge its passage on the grounds that:

"The states and cities of the Southwest cannot care for these unfortunates. They do not, as yet, adequately provide for the care of their own sick. The states and cities from which these people come do not aid them. The people of the United States as a whole should act to assist these consumptive citizens.

"The health records of one city in Texas for twenty-three years show a total of 34,608 deaths from all causes, of which number 6,959 or 20 per cent were reported to have been caused by

tuberculosis. Of the 6,959 tuberculosis deaths, 2,282, or 33 per cent had lived in the city less than six months prior to their decease, the most dangerous period of their illness from the standpoint of infection of others. Furthermore, 4,016 cases lived in the city less than three years prior to death."

Some critics of this legislation who are in sympathy with the efforts of the Southwest in the solution of their problem feel that the Shafroth-Callaway bill does not meet the situation. It is contended, for example, that there is nothing in the bill as now before Congress which would serve as a check upon physicians, poor authorities, relief societies and others against sending an increasing number of indigent consumptives to the Southwest. They contend that if the bill specifically provided that a certain percentage of the cost of maintenance of an indigent "hunger" who becomes a public charge before he gains residence in the Southwest were chargeable against his home town or county, officials and doctors would stop sending such patients away, since they could care for them more cheaply and as well at home, and save the cost of transportation besides. This would help also, they point out, to stimulate increased local hospital provision.

SCHOOL BOARD AS BANKER FOR CHILDREN

"BE THRIFTY" has long been a precept taught in the public schools, but the school board of Little Rock, Ark., has decided to give the children of that city practical encouragement to carry it out. To that end it has organized itself into a banking corporation and has established a penny provident fund in the schools.

This was conducted last year by the United Charities and in taking over the institution the school board added to its membership a representative of that organization. Six banks are paying the salary of a manager for the School Savings Association.

During the first week the school children of Little Rock, a city of 50,000, deposited \$343 and during the second \$510.

PIONEERS OF A NEW SPIRIT—REFORMATORY TO FARM

"WHAT'S THIS any way? Some kind of show?" said a man the other day to an energetic woman going through the Erie railway station in Jersey City with twelve young fellows, each of whom carried bedding rolled up and tied with a string, a box of sandwiches and a change of underclothes.

"Oh, my, no," she laughed. "It's just a school."

The woman was Katharine B. Davis, commissioner of corrections of New York city, and her "troupe" consisted of boys from the New York Reformatory for Male Misdemeanants on Hart's Island. They were bound for the city's new 610-acre farm near New Hampton, N. Y., where they were planning to camp out until they could build their own bunk house.

Last year the city bought these 610 acres of beautiful, hilly land and \$450,000 was appropriated for improvements and buildings. Then a stringency came along and the appropriation was rescinded. Commissioner Davis thus came into office with 610 acres of land and no money.

Conditions at the Hart's Island Reformatory are very bad. The boys there are between sixteen and thirty, just the age of the girls Miss Davis was in charge of at Bedford. Many are first offenders. The institution is overcrowded; there are no facilities for recreation or classification; and although the industrial and school work is fairly good there is only a tiny patch of ground for agricultural purposes.

Rather than wait for another appropriation Commissioner Davis started to beg in order that she might begin to transfer the boys to the farm immediately. She secured a transfer of eight thousand odd dollars in her own department. A friend gave the salary of the farm superintendent. A philanthropic woman gave \$500. Seven saddle horses were about to be abandoned by the aqueduct police near the farm and Miss Davis got them transferred to her department. These will be used for plowing. Cabot Ward, park com-

missioner, gave a plow and manure spreader. The Department of Health had three milch cows at Otisville, a few miles from the farm, and these were turned over to her. After the boys arrived at the farm, some of them tramped to Otisville and drove the cows back.

The twelve pioneers ranged from 18 to 24 years old. They were selected from the 389 boys at the island, all eager to go, because of their physical soundness and because they had shown disposition to make good. The night before they went Commissioner Davis had a heart-to-heart talk with them and showed how the success of the whole experiment rested on them. Each gave his word of honor to do his best.

The bedding, dishes, and food supplies for the first week were sent ahead in a freight car. But that broke down just outside Jersey City, so every boy had to carry his own stuff. Commissioner Davis was with the boys when with the reformatory band playing Auld Lang Syne, they embarked at Hart's Island for a boat ride around the Battery to the Erie station. Just as they were leaving, Warden Murtha ran down to the boat with a white bull pup for mascot. "We named it John Martin," said Miss Davis, "but discovered later it was a female dog so we shall have to call it Jane."

At Jersey City they were joined by Robert Rosenbluth, who is in charge of the farm, and the boys carried his suitcase, violin and typewriter. Nearly the same age as the boys (he is twenty-seven), he is a graduate of Yale and of an agricultural school. Four gradu-

ates of the Cornell agricultural school are to be farm instructors.

The boys are building a bunkhouse for twenty-five under the direction of the Cornell graduates who live, eat and sleep with them. One of the boys is the cook for the party. When they first arrived they camped out in an old tenant's shack. When the bunk is finished another group will be sent from the reformatory. During the summer it is hoped to increase the number at the farm to fifty or seventy-five. They will begin gardening as soon as the ground is ready.

Eventually the farm will need more living houses, a bakery, laundry, sewage disposal plant, schools and out-buildings. But even if she had had the money to take all the boys to the farm at once, Commissioner Davis said, she would rather have done it this way. A wholesale transference would have meant carrying along also the traditions and spirit of the reformatory on Hart's Island. She believes the little group there now will develop a new spirit which will be imparted to those who come after.

Since the first group was sent to New Hampton a tiny ray of financial hope has come to the farm. Some time ago it was determined that the money accruing from the sale of the King's County Penitentiary should be used only for institutions of the department of corrections within the city. But Governor Glynn has signed a bill which releases the money for any department institution. The whole amount is \$165,000. About \$30,000 will be available for the development of the new farm.

FIRST YEAR OF THE CLEVELAND GROUP PLAN IN GIVING

THE RESULTS of a year of Cleveland's experiment in co-operative collection of support for philanthropic agencies were recently presented at the first birthday party of the Cleveland Federation for Charity and Philanthropy.

Over 700 charitable givers, trustees and representatives of the 55 federated organizations which are forming the federation were in attendance. Music was provided by groups from four of the federated organizations, and there were moving and talking pictures in which Andrew Carnegie discussed The Duties of the Man of Wealth. The working of the federation plan was shown in a stereopticon report entitled The Philanthropic Pilgrim's Progress. President Martin A. Marks reported on the year's progress. James R. Garfield spoke for the trustees on the problems which the federation must solve, and Executive Secretary C. W. Williams called for continued interest on the part of givers.

The Philanthropic Pilgrim's Progress showed the journey of Mr. Citizen "from the old world of disorganized benevolence to that which is to come, of federated philanthropy, a series of motionless but moving pictures, passed by the directors of the city of good will, which lies in the state of universal well-being." Mr. Citizen is oppressed by a burden of 10,000 unwholesome Cleveland homes, 4,000 babies who die each year, 20,000 children who do not have the proper chance in life, and 3,000 families which are losing in the battle for right existence.

After many adventures, he lightens his burden by putting his giving on the federation plan of a clearing house for charitable funds and information. He finds that:

In 1911-1912 4,118 federation members (October 1) gave to federated institutions..... \$126,735

In 1912-1913, federation members pledged to the same institutions:

(a) Through federation \$188,335.00
(b) Direct 26,027.50

Total..... \$214,363.00
69.1 per cent gain

Of this amount, 2,063 persons who gave nothing to federation organizations in 1912 subscribed.. 14,749

The same persons, therefore, who gave \$126,735 in 1912 gave in 1913 directly and by federation subscription blank..... 199,614
57.5 per cent gain

Where, in 1912, a giver gave to one organization, he gave to three through the federation in 1913. (In 1909 two-thirds of all givers of \$5 gave to one organization only.)

Mr. Citizen finally enlists in the federation's march toward the goal of \$400,-

CLOSE FRIENDS
THOUGH A
CENTURY
APART

"Aunt Fanny" Banks, 107 years old, has a smile for everyone and is the center of the household at St. Monica's Home for Sick Colored Women and Children at Roxbury, Mass. With her is seven-year-old "Margaret Elizabeth," who reads the bible to her every day.

000 for current expenses in the fiscal year closing September 30, 1914.

President Marks appealed for the same sort of co-operation as that which, in the five months which preceded March 1, had brought in \$158,000 in pledges, with the stream continuing close to \$1,000 per calendar day. He bespoke especially a Cleveland in which the givers should not number a mere 6,000, as they did before the formation of the federation, but close to 60,000—a Cleveland in which every man and woman with a margin over the bare necessities of life should be doing a share in helping those who did not have those necessities.

SOCIAL WELFARE LUNCHEONS FOR OUT-OF-TOWN SHOPPERS

SACRAMENTO, like many other American cities, is the interurban and steam railroad center of a region containing numerous small cities and towns, each with a woman's club. These women do much of their shopping in Sacramento. The Civic Club of that city in conjunction with the Chamber of Commerce holds weekly luncheons at which social betterment topics are discussed, and to which women are invited.

As a next step the Chamber of Commerce organized a campaign carrying the slogan "Make Civic Club day your shopping day" to every civic organization and women's club in the Sacramento Valley. The result is a large attendance of out-of-town shoppers who listen to the addresses and join in the discussions. Some of the topics and speakers have been: The Peace Movement, by David Starr Jordan; Wider Meaning of City Planning by John Nolen; Housing Conditions in California by Jessica B. Peixotto; The City Manager Plan by Prof. T. H. Read.

Other subjects discussed have included playgrounds, sanitation, eugenics, filtration plants, social injustice and municipalization of street railways.

TIME EXPOSURES by HINE

ILLITERATES IN MASSACHUSETTS

THE THREE YOUNGEST IN THIS GROUP AT A FALL RIVER MILL ARE PORTUGUESE CHILDREN WHO COULD NOT WRITE THEIR OWN NAMES. ONE COULD NOT SPELL THE NAME OF THE STREET HE LIVED ON. ALL THREE SPOKE ALMOST NO ENGLISH.

CHILDREN IN MASSACHUSETTS ARE SUPPOSED TO PASS A FOURTH GRADE TEST BEFORE RECEIVING A WORK PERMIT, BUT THE OFFICERS WHO ISSUE PERMITS OCCASIONALLY HELP A CHILD TO READ EVEN THE SIMPLEST ENGLISH SENTENCE.

AT BEST THIS STANDARD IS SO LOW THAT THE MEAGER ENGLISH LEARNED IN SCHOOL IS SOON FORGOTTEN BY CHILDREN WHOSE WORK FAILS TO STIMULATE INTELLIGENCE AND WHO HEAR LITTLE OR NO ENGLISH AT HOME AND IN THE MILL.

THE MASSACHUSETTS CHILD LABOR COMMITTEE HAS FOUND MANY WORKING CHILDREN WHO CAN NEITHER READ NOR WRITE ENGLISH AND WHO CANNOT SPEAK IT WELL ENOUGH TO TELL WHAT KIND OF WORK THEY DO.

WOMEN'S VOTING SIGNIFICANTLY TESTED IN ILLINOIS—BY GRAHAM TAYLOR

ILLINOIS and Chicago give the country the most significant test of women's voting. The local elections held April 7 are recognized to be epoch making throughout the state and city. The possibility of increasing the electorate by over a million and a half women voters in the state and by nearly half a million in Chicago was anticipated with far more concern than curiosity as to what would begin to happen on the registration days in February and March. What actually did happen then and on election day furnishes official figures and cold facts on a larger scale as to whether and how women will vote.

As registration is required only in larger places, the figures for the state can not be given at this writing, but in Chi-

cago 217,614 women registered at their first opportunities. Added to the 455,283 men on the polling lists, these new voters increased the electorate to 672,897 voters, the largest number registered in any city in the United States.

At the primaries the women's votes came within 1 per cent. of equaling the men's. At the election the women polled, at the lowest count of the police returns, before the official revision, 158,686 or 73 per cent of their registered voters, while the men's votes numbered 328,987 or 72 per cent of their registrations. This is conceded by all concerned to be a very favorable showing for the women at their first registration and election. It ought to dispel the conjecture that few women want to vote or will not vote if

given the right, whether they seek it or not.

Next as to the test of the way they will vote. In the increased number and classification of candidates for the city council and in the decision required upon no less than twelve measures of great public importance by the "little ballot," measuring no less than 40 by 12 inches of solidly printed matter, this election exacted of all Chicago voters as great discrimination as they had ever been required to make. It therefore severely tested the interest and intelligence of all new voters, especially women who had hitherto had so much less occasion than men to consider closely such subjects. How did they stand the test?

The aldermanic candidates numbered 154, each ward having from two to seven names to choose from, and designated as Democrats, Republicans, Pro-

gressives, Prohibitionists, Socialists, Independents and Non-partisans. Reporting on the character and qualification of these candidates, the Municipal Voters' League offered the voters its impartially stated facts and its advice based thereon; the United Charities issued a different list of candidates endorsed on the sole issue of "personal liberty" in the sale and consumption of liquor; and the newspapers urged preferred candidates, all the influential papers endorsing with scarcely any deviation those favored by the Municipal Voters' League. The independence and agreement of the principal papers in taking this non-partisan position in local elections give the public-spirited citizens of Chicago a unique advantage over those of most other large American cities.

THE votes of the women, which were awaited with equal eagerness by partisan leaders and by the rank and file of those who had hitherto constituted the non-partisan balance of power, tended decidedly toward non-partisanship. The newspapers agreed with the Municipal Voters' League in crediting the women with electing no less than seven of the better candidates and with wielding their power either to defeat or lessen the majority of many more undesirable candidates.

While eight women were candidates for the city council no one of them expected to be elected, but each entered the lists to make an educational campaign. Two of these campaigns were especially noteworthy. Marion K. Drake led the forlorn hope in running against the notorious alderman, "Bathhouse John" Coughlin, who for over twenty years has disgraced the first ward and the city of Chicago by exploiting the floating vote of the lodging-houses. Her spirited campaign against his character and the conditions for which he stands, was well supported by many of the most influential men and women of the city, and resulted in doubling the vote cast against him as compared with that of two years ago. With 7,355 men voting in that ward, and only a few more than 3,000 women, this is a good showing, although nearly 600 more women voted for the discredited man than for the worthy woman candidate, which is not surprising in view of the dependence of the underworld upon its patrons.

In the great cosmopolitan tenement house family ward surrounding the Northwestern University Settlement, its head resident, Harriet E. Vittum made a most effective educational campaign. Her slogans were "For the babies," "For the school children," "For the working boys and girls," "For men and women," under each of which she grouped the better home conditions and municipal policies for which she asked votes. A house to house canvass among the foreign people, rousing mass meetings with many men speaking for her in the foreign languages

and a children's parade of many hundreds of little boys and girls were some of the features of the campaign. That any woman in such "a man's world" as this ward has been, could have secured 1,421 votes, the number next highest to that of the re-elected alderman speaks highly for her candidacy.

In deciding the important public measures, including heavy bonded issues, the women showed as intelligent discrimination as the men. In proportion as these propositions were actually most dangerous or doubtful, they were overwhelmingly defeated,—notably a discredited subway scheme, a suspicious county hospital bond issue, and some city bond issues for purposes for which other funds are available.

The Bureau of Public Efficiency discovered that nearly two millions of previously authorized bonds are still unsold by the administration. It therefore advised the defeat of more bonds for police and fire stations. The need of these is acknowledged, but money for most of them is in hand. The people heeded this advice. With unerring discretion, two other bond issues of importance to public welfare were carried by heavy votes. A contagious disease hospital and other buildings for the health department, and the acquisition and improvement of bathing beaches, were thus secured. A demand upon the Legislature to restore home rule for the control of public utilities within the city limits also received a majority.

Many women served as clerks and judges of election throughout the city, with two noteworthy results—that their services were highly commended by the election commissioners and that every woman official reported the most considerate and decorous speech and conduct upon the part of the men during registration and election days. The leading election commissioner issued the following statement on the morning after election:

"Chicago women are again to be congratulated as an influence for good in politics. Their presence was like oil upon the turbulent waters in every precinct of every ward in which there were bitter clashes. In no precinct did the presence and activity of women in the political contest make them mannish. There was less drunkenness around the polling places than there has been in years, because the practical politicians knew that drunken workers around a polling place would drive away the vote of the women for their candidates. Today's election really demonstrated that elections and government have been brought closer to the home. The women have shown that. Above all, the women in all walks of life, and in all parties, proved they are interested in and appreciate their duty."

In one of the best residential wards, where influential women were very ac-

tive in electing a good alderman, one of them said: "It has been the most wonderful feeling, working shoulder to shoulder with the men in something that has really been our duty all along." Mary E. McDowell, who led the fight for a better candidate who almost won out in the stockyards district, had this to say: "After nineteen years I thought I knew my ward. But I never really began to know it till I came to experience this great new neighborliness which has come to all of us women through the political work of the election."

Jane Addams, who was judge of election in her own precinct surrounding Hull House, said:

"I was amazed at the way the women of my own ward had informed themselves. Of the 159 women registered in the precinct, 139 voted. The women in every ward of the city showed that they had an intelligent understanding of the issues. I think it was a great thing to have women in Chicago brave enough to run in this aldermanic election and to be willing to face the probable defeat. There was something very exhilarating, something very young and courageous in the willingness of a woman to tackle the fight against Alderman Coughlin. It has been a red-letter day for women, this first day of voting."

WOMEN'S votes "down state" get full credit from both the politicians and the newspapers, not to say the liquor dealers, for having put out of business 946 saloons in 114 incorporated cities and villages. In 29 more the vote to remain dry rolled up a majority of 8,888, aggregating a total dry vote in these districts of 35,462. While the liquor forces carried 60 cities and villages and thus kept them "wet," they failed to win a single township which was dry prior to the elections. In some places, as at Springfield, women's votes helped swell the majority for the saloons. But in a total vote estimated at 200,000 cast on the saloon issue outside of Chicago, where the issue was not raised, the *Chicago Tribune* figures that 100,000 were cast by women and that 65 per cent of these were against the saloon.

Clearly in anticipation of women's voting in Chicago, an ordinance was passed by the Chicago City Council abolishing the "family entrance" and "ladies' entrance" signs from saloons. This action was not opposed by the liquor interests represented by the vigilant and aggressive United Societies. To the representative women who promoted this action, one of the most notorious of Chicago's aldermen, who for many years has led the forces for evil in the city council, once a majority and now a hopeless minority, declared: "You are doing a noble work, ladies, you should now clean up the dance halls."

The handwriting seems to be on the walls, the enemies of the good themselves being judges.

INDUSTRY

THE "THIRD MAN" AND HIS PART IN INDUSTRIAL DISPUTES—BY JOHN A. FITCH

WHETHER GATLING guns or protocols are most efficient promoters of industrial peace, whether the best instrument with which to settle a dispute is negotiation or a club, and whether a fight should go to the limit of a knockout, or arbitration should displace the fight altogether were among the questions before the Industrial Relations Commission in Washington last week. Not that Gatling guns or clubs came in for much actual discussion, but they were in the background of everyone's thoughts with the House Committee on Mines and Mining holding hearings at the same time on the Colorado strike.

Linked up with this question was that of collective bargaining, or unionism, and during the four days that witnesses were heard there were presented some remarkable tributes to the efficiency of union methods and the character of union leaders. With equal force deficiencies and shortcomings were pointed out.

Francis Peabody, one of the big coal operators of Chicago, talked with an air of utmost frankness, tempered with a delicious irony. Mine owners recognized the union because they couldn't help themselves, he said. The miners were very clever, too clever for the operators, it would seem. And yet it was good for the miners. Mr. Peabody had been very happy in the non-union days, he declared, but he hadn't paid the men enough. Now he can't help himself. The union makes him pay.

"The miners haven't demanded anything they didn't think they were entitled to," said Mr. Peabody. "They have demanded a lot of things, though, and by hook or crook have got them."

"Then, in other words, they have done just what any of us would do?" queried the counsel.

"Exactly," was the reply.

When he spoke of the improvement in conditions of living among miners, Mr. Peabody paid a striking tribute to John Mitchell. "I have been in many a miner's home," he said, "and found John Mitchell's picture enshrined there. The place he occupies in the hearts of these people makes him a tremendous force for betterment. Many of them may never have seen him or heard him speak, but his influence is among them, raising their standards of living and improving their morals. To many an immigrant miner John Mitchell stands for America."

To turn from mining to the clothing trades, Joseph Schaffner, of Hart, Schaffner and Marx, Chicago, told how one day in 1910 a friend stepped into his office and congratulated him on the great business he and his partners had built up.

Probing the Causes of Unrest

The first of a series of interpretations of the hearings before the Federal Industrial Relations Commission by a staff representative of The Survey.

He thanked his friend, but told him that the thing in which he took greatest pride was the happy condition of the 10,000 employees.

"I thought they were happy," said Mr. Schaffner, "but two days after this incident the strike came. They had not known the firm, and we had not known them."

"And now they have a chance to express themselves?" was asked.

"Now they can maintain their self-respect," said Mr. Schaffner.

It may be assumed that these views were not shared by all the employers or representatives of employers who were present. For example, James A. Emery, counsel for the National Association of Manufacturers, who appeared on the last day of the hearings felt differently. It was a real misfortune, however, that Mr. Emery apparently did not feel inclined to give full expression to his views. A complete statement of the basis of the opposition to unionism by the Manufacturers' Association ought to be on the records of the commission.

O. P. Briggs of Chicago, for many years an officer of the National Foundrymen's Association, testified that in 1904 after five years of dealing with the International Molders' Union, his association had been compelled to abrogate the contract. The policies of the union that he named as being responsible for this action were the minimum wage, an unreasonable limitation of apprentices, objection to the use of machines and an unwillingness on the part of the union to submit matters in dispute to arbitration.

Joseph Valentine, president of the Molders' Union and John P. Frey, an executive officer, answered Mr. Briggs with spirit, and then Thomas J. Hogan, also of Chicago and secretary of the Stove Foundry National Defense Association, came before the commission. Mr.

Hogan said that his association represented nearly all of the stove manufacturers of the country and that for twenty-four years they had had a contract with the molders' union which has worked with satisfaction to both sides and without a single strike in all that period. He described the period prior to the signing of the agreement in 1890 as a period of warfare, but now he said they had found a better way.

The chief subject before the commission was arbitration and the witnesses were asked to state their opinion of arbitration as a method of settling industrial disputes and to state whether the government could assist in any way by setting up an agency in the form of an industrial council.

All the union men who appeared before the commission, except those representing the clothing trades, expressed themselves as opposed to arbitration which involved a "third man" or umpire. Negotiations that could be carried on without the aid of an outside party—in other words conciliation and conference—they believed productive of better results. The point they made was that an outsider cannot understand the technique of the industry involved and his decision, however honestly made, is likely to be an unsatisfactory one. "I'd as soon toss a coin to decide a dispute as to call in an outsider to settle it," Samuel Gompers told the commission.

With this position the employers were for the most part, in substantial agreement. Charles Francis of New York, representing the National Printers' League, told of an arbitration award made by the late Bishop Potter, which could not be put into effect because of the arbitrator's lack of technical knowledge.

It began to look as if an outsider had no place in an industrial dispute. Just at this juncture, however, the most unassuming man in the room was called to the stand. What he could contribute to the question under discussion was unknown. It created no ripple of excitement when the chairman called for J. E. Williams, of Streator, Ill. It is a fair guess that most of the members of the commission would have been as likely as not to call him J. E. Streator of Williams, Ill., if they had been obliged to give his name a moment after it had been pronounced by the chairman.

But when he left the stand he had unquestionably made on the commission and on everyone present a deeper impression than had any other witness. No one who heard him will soon forget J. E. Williams, not because of his testimony alone, but because of what it revealed in personality and character. Here was a "third man" who could interpret the part.

J. E. Williams is chairman of the arbi-

[Continued on page 85.]

SOCIAL INSURANCE

THE WISCONSIN LIFE FUND: HOW IT IS MANAGED —BY REUBEN MCKITRICK

PROFESSOR OF ECONOMICS, IOWA STATE TEACHERS' COLLEGE

Among the various experiments being carried on in Wisconsin's social laboratory is a life insurance system, conducted and managed by the state. Its first policies were issued last fall. THE SURVEY has asked Prof. Reuben McKittrick to explain and discuss the Wisconsin plan. Professor McKittrick was for two years an assistant of Charles McCarthy in the Wisconsin Legislative Reference Library at Madison, where he specialized on insurance problems.

THE STATE OF WISCONSIN, in 1911, established what is known as a "life fund," in which any able-bodied citizen of the state may insure his life. Bills providing for similar insurance were introduced during the legislative sessions of 1913, into at least eight other states. None of these bills were enacted into law. Their simultaneous introduction, however, into so many legislatures representing every section of the United States indicates a marked tendency among the people to look to the state for the performance of a function hitherto regarded as a purely private business.

Briefly stated, the Wisconsin law establishes a fund derived principally from the payment of premiums which is administered by the state for the purpose of granting life insurance and annuities to its citizens. The state does not assume any liability beyond the amount of the fund.

The published premium rates are based upon the American experience table of mortality with interest at 3 per cent. An expense charge of two dollars a year for each thousand dollars of insurance is included in each premium, together with an amount equal to one-sixth of the present value of the cost of insurance estimated according to the mortality table. With the exception of a two-dollar medical fee these two items constitute the charge for expense. A surplus is to be accumulated out of net profits and the balance of net profits is to be distributed to policy holders. Loans may be made which, together with interest at 6 per cent, shall not exceed the reserve. Premiums not paid when due are to be regarded as loans until they, together with interest at 6 per cent, equal the reserve, at which time the policy terminates. Such loans and interest charges may be paid, however, at any time before they become

equal to the reserve. Thus the policy is continued in force so long as the reserve lasts. Tables have been published which show exactly what the reserve is at any year during the life of any class of policy issued.

The state has no regularly employed agents for this business, but authorizes every state factory inspector, the clerk and treasurer of every county, town, city, and village, and every state bank to fill out and transmit applications for insurance to the insurance commissioner; also to receive and transmit insurance premiums. These may be transmitted directly, however, by the policy-holder. The fees allowed for such transmission are twenty-five cents for each application and 1 per cent on each premium collected or transmitted directly.

Policies of life insurance may be issued to persons between the ages of twenty and fifty years in amounts of \$500 or multiples thereof not to exceed \$3,000. Annuities may also be granted to persons between the ages of twenty and fifty years to begin at the age of sixty. These annuities may be had in sums of \$100 or multiples thereof, but not to exceed \$300 on the same risk. No policies can be issued under the act, however, until at least 200 applications for insurance amounting in all to not less than \$100,000 have been received and approved. No deposits of securities with the auditor or treasurer are required.

By the autumn of 1913, the number of applications required had been received and approved. The first policies were issued October 27, 1913, and thus life insurance in a state fund became an accomplished fact in the United States.

There are at least three particular points of view from which this legislation is of special interest to social workers: the ability of the state fund to get business; the security provided for the policy-holders; and the cost of insurance to the policy-holder. These points will be considered in the order mentioned.

The state does not aggressively solicit business through the personal representation of agents. It relies upon the ability of its administrative officers to explain the nature and operation of the plan clearly and concisely to its citizens, and upon the judgment of the citizen to know whether or not he wants such insurance. If he does, the insurance is dealt out to him in an "over-the-counter" fashion. It is said that the delay of one year in putting this state insurance idea into effect "has

disclosed its great fault—the absence of any provision to solicit business—and has further developed the fact that people generally do not hanker for insurance on their lives, being insured chiefly when some enterprising agent of a private company has persuaded them to append their signatures to policy applications."

That the foregoing statement concerning the solicitation of business has been true of the past no one will deny. That it will always be true of the future does not necessarily follow. In fact, within the past year the New York insurance department has issued a report setting forth the good financial standing and somewhat remarkable increases of business that have been attained by a private company in that state which relies entirely upon advertising and correspondence for the solicitation of its new business. Although many persons doubtless would hesitate to make application to insure their lives in a plan not yet in actual operation, there are many indications that when a state life fund once gets into a working condition it may be liberally patronized and be of no little benefit to the citizens of a state.

State Assumes No Liability

As set forth above the state does not assume any liability to policy-holders beyond the amount of the fund. This freedom from liability may at first seem to be a serious objection to the plan. Whether or not it is so regarded will depend upon the standard which the reader adopts as a test for safety in starting a new insurance business. Since the requirements for this purpose are different in different states, a further explanation and comparison of this feature of the Wisconsin plan may be advantageous.

Insurance in the Wisconsin life fund is mutual insurance. It differs from that offered by the familiar form of life insurance company chiefly in the fact that the administrative organization of the state has been substituted for the business organization of a private corporation. As the principal executive officer of this fund the commissioner of insurance has worked out the tables of premium rates on the basis of the mortality experience of private insurance companies doing a level premium, or what is more commonly known perhaps as an "old-line," business. These rates do not show any disposition to trifle with safety merely to reduce cost to the policy-holder. The similarity between the insurance provided in this fund and that of private companies may be more clearly indicated by the following quotation from the report sent out by the insurance department:

"The basis and plan of this insurance is exactly the same as that in use by the larger and older companies in this country. It differs in that premiums generally provide a smaller amount for expenses than in other cases where dividends or refunds of savings and gains are to be paid, due to the fact that the law provides for no agents or solicitors."

The officers and directors of a level premium private company are not personally liable for the policy contracts entered into by such companies. In a purely mutual level premium company there are not even any stockholders who are liable for the policy obligations of the company for such companies are composed only of policy-holders. When mutual insurance is conducted on the level premium basis these policy-holders can not be assessed to make up a deficit because the limit of the charge upon them is fixed by their policy contracts. The success of such an undertaking depends (1) upon the accuracy and adequacy of the original charge upon the policy-holders in the form of premiums and (2) upon the number of persons insured; the larger the number usually the more certain will the experience of the company be to conform to the law of average. This is the fundamental principle in all insurance.

Statutory Requirements

The widely differing views that prevail in different states as to what constitutes a reasonable requirement of a private company, for safety in beginning a mutual life insurance business may be illustrated by the citation of three typical instances. Wisconsin requires that at least two hundred persons must have subscribed for insurance amounting in the aggregate to not less than \$200,000 and have paid one full annual premium in cash amounting in the aggregate to at least \$20,000. No deposits of securities with the state are required before a domestic mutual life company may begin business. New York, on the other hand, requires that at least five hundred persons must have subscribed for insurance amounting in the aggregate to not less than \$1,000,000, that one full annual premium must have been paid in cash, and that securities amounting to \$100,000 must have been deposited with the superintendent of insurance before such a business may be started.

Iowa, being more liberal than New York, but more rigid than Wisconsin, requires that at least 250 persons must have subscribed for insurance amounting on the average to \$1,000 each, that one full annual premium must have been paid in cash and that a deposit either in cash or securities equal in amount to three-fifths of a full annual premium must have been made with auditor before policies may be issued. It will readily be seen therefore that so far as domestic mutual life insurance companies are concerned, there is a wide range of variation in the statutory requirements for safety in the starting of a new business.

Even though Wisconsin is the most liberal of the three instances cited, yet the life fund is put upon practically the

same basis as a domestic mutual in that state. All the requirements for issuing policies in the Wisconsin life fund are the same as those for issuing policies in a private mutual company except that the minimum amount of insurance subscribed for may be only \$100,000 in the former instance, whereas it must be \$200,000 in the latter. It does not seem to the writer, therefore, that a policyholder in this life fund would be running an unreasonable risk even though the state does not assume any liability beyond the amount of the fund. Indeed such a safe-guard is of utmost importance for otherwise a subsequent ill-advised foolhardy administration might regard the state treasury as a haven of rest for all weary and cost burdened policy-holders and by arbitrarily reducing premium rates without regard to science or experience speedily steer the state's financial ship into the shoals of bankruptcy.

Whether or not this new undertaking will be able really to reduce the cost of insurance to policy-holders would seem to depend largely upon its ability to earn dividends. The savings which are expected to be made for this purpose are clearly set forth in the following interview given out by Commissioner Ekern:

"The purpose of the state life fund is to give the people of the state the benefit of the best old-line insurance on a mutual plan at the lowest possible cost. To benefit the policy-holders is the sole consideration. Of the total expense of old line companies, more than one-half goes to agents in commissions and salaries. Under the state plan policy-holders are saved this great expense. Besides there will be gains from excess interest earnings and mortality savings.

"The premium rates require that 3 per cent interest shall be earned. The funds should earn at least 5 per cent, leaving a margin of 2 per cent as a source of dividends to policy-holders. A greater item of savings for the dividends of policy-holders, however, comes from the fact that the actual number of deaths runs about 40 per cent below the number calculated in the table."

Only experience can demonstrate whether or not these expectations will ever come to pass. A comparison of the published rates of the Wisconsin life fund with those of one of the strongest and best known old line companies shows that nominally they are somewhat lower. There is a difference of 90 cents, for instance, in favor of state insurance on a \$1,000 ordinary life policy at age twenty-five. This difference increases to \$3.56 on the same kind of policy at age forty-five. On twenty payment life policies for \$1,000 the difference in favor of state insurance is \$1.82 at the age of twenty-five, and \$4.76 at age forty-five.

It should be born in mind, however, that old line companies have the same opportunity and really do make savings on all the items contemplated by the state fund except that of salaries and commissions to agents. When the dividends, therefore, allowed by old line companies to their policy-holders are applied to reduce the premium rates, it

may well be doubted whether any very substantial gain in reducing the cost of insurance to policy-holders will be accomplished by the Wisconsin life fund.

What then will justify the trying of such an experiment in social legislation? The description of the fund sent out by the insurance department claims the following advantage at the end of a long list of others: "It will increase confidence in life insurance and encourage the extension of its protection to every resident of the state and will increase the business of sound companies and societies."

Circular on State Insurance

The administration of this act thus far bids fair to accomplish this desirable end. Under the direction of an able commissioner a circular has been prepared which concisely sets forth all the advantages of state insurance and explicitly informs applicants in regard to steps to be taken to obtain such insurance. The brevity and simplicity of the policy and the remarkable clearness with which such terms as premium, cost of insurance, and reserve, have been described and the methods of computing them have been illustrated should greatly assist in developing a widespread understanding of the general principles of insurance. If life insurance is socially beneficial, it seems just as desirable that the state should contribute to a general understanding of insurance principles and benefits as that it should "show farmers how to grow two stalks of corn where one grew before." In so doing it would supplement the work of private companies as the postal savings banks do private banks engaged in a savings business.

If other states could be assured of the same kind of able administration and more private companies would adopt the same simplicity in their policies and directness in their methods as is manifest in the management of the Wisconsin life fund, confidence in life insurance would be increased and its protection would be more generally extended to every citizen of the state.

Objection to this plan will doubtless be raised wherever it is seriously considered for adoption, on the ground that the men relied upon to administer it are likely to become involved in politics. In fact, an unsuccessful attempt was made for political reasons last winter to remove the commissioner who worked out the plan of a life fund for the Wisconsin Legislature and whose administrative ability is of utmost importance in successfully beginning the operation of this social experiment.

Social workers will not be dismayed, however, on account of such an objection for devices of government are now being perfected which enable the state to retain the services of able scientific men in spite of adverse political conditions. Wisconsin, indeed, furnishes a good object lesson in the permanency of tenure which seems to have been accorded to men who are serving on its railroad and public utility, tax, and industrial commissions regardless of which party faction may be in control.

EDUCATION

TEMPERANCE INSTRUCTION IN PUBLIC SCHOOLS AND ITS RESULTS—BY EDWARD H. WILLIAMS, M. D.

A FEW WEEKS AGO former President Taft in an address delivered at the commencement exercises of a college in Philadelphia made the following significant statement regarding certain text books used in our public schools:

"Criticism . . . might well be directed to many text books that seek to inculcate aversion to the use of intoxicating liquor. The unwise extremity to which legislators have gone in the requirement for such teaching has stimulated a class of books which dwell on the results of the use of intoxicating liquors in such an exaggerated way that pupils soon begin to understand that they are grotesque exaggerations, and therefore they become skeptical in respect to the whole matter."

This statement is but a reiteration of the warning given more than ten years ago by one of the most learned, conservative, and non-partisan bodies of men ever organized in America, co-operating directly with the leaders of thought all over the world,—namely, the Committee of Fifty, organized for the purpose of studying the alcohol question in all its phases. After several years of investigation this committee said, in its publication of 1903:

"Under the name of scientific temperance instruction there has been grafted upon the public school system of nearly all our states an educational scheme relating to alcohol which is neither scientific nor temperate nor instructive."

Meanwhile this "educational scheme" has been carried into other states and teaching by falsehood has gone unblushingly on. The text-books in the schools today, which nearly every child in the country is required to study, show no improvement over those scored by the Committee of Fifty.

Let us see how the trouble started. In 1879, Mary H. Hunt presented to the National Convention of the Woman's Christian Temperance Union, her scheme "for thorough text-book study of scientific temperance in public schools as a preventive against intemperance." The scheme was adopted and as a result the W. C. T. U. began an active campaign to secure legislation requiring the teaching of "scientific temperance" in the public schools. By the time of the investigation of the Committee of Fifty, forty-three states had passed such laws and twenty-four text-books, "authorized" by the W. C. T. U., were in use.

The Committee of Fifty, which reported that these books were not scientific included such educators as Charles W. Eliot, Seth Low, and Prof. R. H. Chittenden; such ecclesiastics as Bishop Alexander Mackay-Smith, the Rev.

Father A. P. Doyle, and the Rev. Washington Gladden; such physicians as Dr. William H. Welch, Dr. H. P. Bowditch, and the late Dr. J. S. Billings; with such names as Carroll D. Wright, the late Richard W. Gilder, William Bayard Cutting, and some forty others no less distinguished, completing the galaxy.

Science is but another name for accepted truth. We must infer, therefore, that these books contained statements which were not accepted as facts by the members of the committee. As a typical example, we may take the statement, made in practically every one of the accepted text-books, relating to the physiological action of alcohol. In these books, none of them vouched for by any authoritative writer's name, and eight of them written anonymously, appear such sentences as the following:

"We can find nothing about it [alcohol] that gives us any idea that it is a food." "Alcohol is not in any sense a food." "Alcohol is not a food . . . Close observation of its effects on man does not warrant us in believing that it has any value whatever as a food." "Alcohol is not a food, for it cannot build up any part of the body. It contains no mineral substance and will not make healthy fat." And so on through the entire twenty-four volumes.

It should be noted that the question of the advisability of *using* alcohol as a food is not involved. It is simply the question of alleged physiological facts that were at once open to challenge, and were so challenged by the leading scientists of the world.

This committee did not stand alone in its criticism. Sir Michael Foster laid the matter before the International Physiological Congress, and more than sixty members signed a statement contradicting the dogmatic teachings of the American public school text-books. The statement they affirmed is in part as follows:

" . . . The results of careful experiments show that alcohol, so taken (in di-

luted form, and in small doses) is oxidized within the body and so supplies energy like common articles of food, and that it is physiologically incorrect to designate it as a poison, that is, a substance which can only do harm and never good to the body."

Thus it will be seen that the statements made in the American text-books were contradicted generally, and specifically, by men who had proved their right to a hearing, and who did not express their opinions in anonymous publications. It is evident, therefore, that the authors of the American books were either ignorant about facts, or had wilfully stated untruths—for neither of which can there be any valid excuse.

The committee interrogated the author of one of the American text-books which was being used in hundreds of public schools. His answer removes all doubt as to his purpose:

"I have studied physiology and I do not wish you to suppose that I have fallen so low as to believe all of the things that I have put into those books."

Another author showed his dishonesty in the most brazen way by writing two text-books, one for medical students, the other for school children, which was listed as "authorized." His attitude is shown in the following quotations:

"AUTHORIZED" BOOK (for school children)	UNAUTHORIZED VERSION (for medical students)
"Has alcohol a just claim to be called a food? Is alcohol a tissue-forming food? To this the answer is certainly, No . . ."	"ALCOHOL . . . according to circumstances, alcohol may be a poison or may be useful; when useful it may be regarded either as a force regulator or as a force generator. . . . If the facts lead us to conclude, against the extremists, that it is to a certain extent a food, it is nevertheless a dangerous one. . . ."

TEACHING BY INNUE- ENDO

"There is more poison in the one on the right than in the one on the left" says the caption under this picture. Quite possible, but not a hundredth part of the nicotine in the cigars enters the smoker's system.

From *Health Lessons*, Book I. Copyright, 1910, by Alvin Davison. By permission of the American Book Company, publishers.

This attitude of deception characterizes all the "authorized" text-books condemned by the committee, wherever the question of narcotics is involved.

The food-value of alcohol is treated much less grotesquely than many other topics. Indeed, some of the statements were of such character that the Committee of Fifty in its official report asserted that: "These books, especially those intended for the lower grades, fairly bristle with statements of a character to work upon the fears of the reader, and remind one in this respect of patent medicine advertisements."

This statement was not published, however, until after the committee had called the attention of the Department of Scientific Temperance Instruction of the W. C. T. U. to several glaring errors in these "approved" text-books. This kindly criticism elicited no reply. But the following year the advocates of scientific temperance teaching issued a circular, in which the statement was made that their "experts" had examined all the endorsed school books, and that "not a single member reports finding them inaccurate, but exactly the reverse."

This finding is entirely comprehensible, however, if we consider the avowed point of view from which the "experts" conducted the investigation. It is summed up in one of the official publications of the promoting organization. "This is not a physiological, but a temperance movement," it declares. "Temperance should be the chief and not the subordinate topic and should occupy at least one-fourth the space in text-books for these grades."

Meantime the work of converting states to the régime of enforced instruction in scientific temperance steadily progressed. Forty-three states had passed laws stating specifically that such instruction should be given, at the time that the Committee of Fifty made its report. At the present time it is the boast of the W. C. T. U. that they have brought every state in the Union, and every American dependency, under the sway of such laws, and that the laws are being rigidly enforced.

The laws of New York state may be taken as representative. In New York, "All pupils . . . below the second year of the high school and above the third year of school work . . . shall be taught and shall study this subject

[scientific temperance] every year . . . for not less than three lessons a week for ten or more weeks, or the equivalent of the same in each year. . . . All pupils in the lowest three primary, not kindergarten, school years, or in corresponding classes of ungraded schools, shall each year be instructed in this subject orally for not less than two lessons a week for ten weeks . . ." And the paragraph containing this clause closes with the sentence: "Nothing in this act shall be construed as prohibiting or requiring the teaching of this subject in kindergarten schools."

Thus we see that every pupil who attends school for the usually prescribed length of time, must devote some 250 hours to studying the effects of alcohol and narcotics. Considering the number, and importance, of the branches that must be studied during these crowded school years, this amount seems greatly disproportionate. It impressed Professor Kronecker, of Berne, as being so when he examined our school systems. "I was quite shocked," writes Professor Kronecker, "when I read that in the primary and middle grades every child from six to seventeen years is instructed 250 hours in the physiology of alcohol. If I were to teach this subject *five* hours I should know of nothing more to say, and should probably be discharged by the authorities as a stupid teacher."

I have before me an imposing array of volumes, all of them endorsed by the W. C. T. U. and used in the schools of one or more states at the present time. One of these books for smaller children,—a book in use, the publishers assure me, in more than a thousand schools throughout the country,—is presented in twenty-four chapters. Nineteen of these are devoted wholly, or in part, to the subject of alcohol and narcotics.

One full chapter is devoted to How Narcotics and Stimulants Affect the Brain and Nerves; one chapter on Alcohol and Health; one chapter on Tobacco and the Drugs Which Injure Health—mostly tobacco; and one entire chapter devoted exclusively to a minute description of how beer, wine, whisky, brandy, and rum are made, with pictures of the various materials used, and carefully described illustrations of whisky stills that should prove inspiring to almost any embryo moonshiner.

Yet this book is not a manufactur-

er's manual, but a "physiology," and the W. C. T. U. speaks of it in glowing terms. Even the modest author (who, needless to say, is not a physician) admits that it is a good book. It is simply representative of its class, and conforms to the accepted method of teaching scientific temperance. The following quotations, taken at random, will give some idea as to what extent the authors have corrected the defects criticised by the Committee of Fifty:

"Any one who tires his jaw by chewing tobacco is not likely to chew his food well." . . . "Now, this same busy stomach has no liking for alcohol which is in all kinds of strong drink. Just as your eye will smart and become red if something gets into it that does not belong there, so the stomach is made red and inflamed by alcoholic liquors." . . . "The old tobacco user is often cross, peevish, and liable to fits of anger." . . . "It [wine] . . . makes the muscles which mix the food in the stomach act more slowly. *Some of the food may sour before it gets wet with the juice.*" . . . "Sound teeth which will do good work in chewing food are worth more than a foot or an arm." . . . "Don't you remember how, when you have breathed the fumes of a burning match, they have irritated your throat and made you wheezy and hoarse for a few minutes? Now it is in this same way that strong drink often acts to make the voice rough and broken." . . .

The tone and character of the books "authorized" for the smaller children differs very little from those used by more advanced pupils. In the advanced courses, however, the authors tend to devote more space to therapeutics; and, not being physicians (or, at best, physicians who must "conform"), they indulge in all manner of puerile grotesqueries. Thus in one book, written for "advanced" pupils, and used in thousands of schools, appears this sentence: "The body can be made comfortable out-of-doors in cold weather, by wearing an overcoat or wrap."

In another book, such useful bits of information as the following are given: "A man is so sensitive about the dull red end of his nose that he is ready to welcome almost any device which may rid him of it." (A picture of a man having his nose treated is shown in this book.) "One pint of such liquor (referring to adulterated whisky) at one time will kill the strongest man." . . . "No cigarette smoker can attain the highest position in the world." . . . "The use of tobacco daily seems in some degree to affect the sense organs of the mouth so as to lead to a desire for strong drink."

The cause and treatment of diseases offer attractive fields for these authors. "If there is an inherited tendency to cancer," one of them asserts, "the irritation of the membranes of the mouth by the constant presence of tobacco is likely to cause the disease to break out in that place." This should be welcome news to the scientists who have as yet been unable to fathom the cause of cancer, or determine its heritability. There

This illustration seems to tell how a youth can avoid one evil effect of the use of alcohol. The caption under it reads: "By electricity through the point of a needle many capillaries are destroyed; after that the man is cured of his red nose." The picture is copied from the *Literary Digest* and appears in *The Body and Its Defenses*, by Frances Gulick Jewett.

is, perhaps, a connection between cancer of the lip and the irritation due to the touch of pipe or cigarette; but why not state this in a straightforward way?

The same author, who appears to have a *penchant* for therapeutics, although not a physician, states that "neither whisky nor beer is of much value in curing disease." Osler, perhaps the most conservative authority in the use of drugs, recommends alcohol in the treatment of twenty different classes of diseases, to say nothing of special conditions, and says, "I should be sorry to give up its use in the severe forms of enteric (typhoid) and pneumonia." He recommends it particularly in cases of collapse; but our school-book author disagrees with the Oxford professor. "Do not give alcohol," he admonishes, in suggesting treatment for this condition. Incidentally he assures us that appendicitis may be prevented by proper diet.

Hundreds of thousands of children in our country are having these statements reiterated to them every day. It would be interesting to know just how many parents realize that their children are spending 250 school hours in acquiring this sort of "education."

In the last analysis, educational movements and methods of any kind must be judged by results, although most educators do not believe in methods of teaching that are based upon falsehoods or deception. And yet I believe that a vast majority of persons would be inclined to deal leniently with any form of teaching, truthful or otherwise, that would lessen the steadily rising tide of alcoholism and pernicious cigarette smoking in this country. It is the hope that something definite might be accomplished, regardless of method, that probably explains why scientific temperance teaching has been allowed to obtain such a grip on the schools.

It so happens that we are now able to measure the extent of this accomplishment by an accurate index—the relative consumption of liquors and tobacco since scientific temperance teaching has been in active operation. Government records show that in 1896, a period of unusual activity in promoting scientific temperance teaching, 67,039,910 gallons of whisky were consumed by the American people. The same records show that in 1913, with every public school in the United States teaching scientific temperance, 140,418,289 gallons were consumed. In other words the actual quantity of whisky used had considerably more than doubled during those years of active teaching; and we are confronted by the appalling fact that "the average American today consumes almost six times as much liquor as did the average American of 1850."

Yet in the face of these figures, the school text-books continue to make the assertion that "The actual quantity of alcoholic drinks consumed is steadily decreasing."

The increase in the consumption of tobacco is even more startling. The government reports show that in 1903 the number of small cigarettes consumed was a little over 3,000,000,000. The war against this particular form of cigarette

has been waged in countless pages of text-books since that time. Yet in 1912 the number of cigarettes consumed had risen to more than 13,000,000,000—four times the number used nine years before. Meanwhile the number of cigars, which escape with scant mention in the school books, has increased only about 8 per cent.

Thus we see that despite these thirty years of most active legislation, which brought under its sway practically every American boy and girl for a period of several years, there was an increase in the consumption of the very narcotics this legislation sought to suppress, that is unparalleled in the history of the world. Judged by results, this active legislation seems to have been far more

beneficial to the manufacturers of whisky and cigarettes, than to the pupils of the public schools.

"More evil will probably accrue to the next generation through this legalizing of lies than would result without direct effort for moral teaching," wrote Professor Sewall to the Committee of Fifty seventeen years ago. "I believe that the temperance cause is likely to be injured rather than advanced by such instruction," Dr. F. W. Ellis asserted. And now Mr. Taft sounds the warning that "pupils are becoming skeptical in respect to the whole matter."

Certainly they have grounds for their skepticism. But what will be its limits if the present methods of instruction continue?

Y. W. C. A. TRAVELING LECTURER ON SEX HYGIENE —BY W. G. TINCKOM FERNANDEZ

TO DETERMINE its attitude on the question of sex education the National Board of the Young Women's Christian Association recently appointed a commission whose findings are now incorporated in a small book containing the addresses of Dr. Richard C. Cabot delivered before the Y. W. C. A. conference held in Richmond, Va., in April, 1913. The Y. W. C. A. feels that it is "under obligation to promote knowledge of the fundamental facts of life, to arouse a sympathetic attitude toward them, and to call forth the power whereby this knowledge shall make for individual and community morality."

The first step toward putting these recommendations into operation has come with the appointment of Dr. Mabel Sims Ulrich, of Minneapolis, as lecturer to schools and colleges. The national board has affiliated associations in 675 schools, colleges and universities. Dr. Ulrich's work will carry her throughout the country.

The method of imparting knowledge is through a series of talks. Wherever possible, as in regular school courses, the biological approach is made through courses covering at least one term's

work. After the first year the plans may extend to additional courses to provide for consecutive study and extended work.

As a pioneer worker in sex education Dr. Ulrich is already well known. A graduate of Cornell, she obtained her medical education at Johns Hopkins, and went to Minneapolis in joint practice with her husband. In the course of her medical work Dr. Ulrich found the matter of sex education intruding on her every-day experience. Herself a mother, she was continually consulted by mothers on this problem. Five years ago a school teacher voluntarily came to her with the problems of her young charges. She confessed her inability to suggest or direct; besides, she said, the subject was not in the curriculum, and so outside her province.

This discovery extended to other teachers and graduates of the state university, and soon Dr. Ulrich found herself in a consultative relation to the young women of the University of Minnesota. In recognition of her pioneer work in education, the mayor of Minneapolis appointed her a member of the vice commission.

During a recent visit to New York Dr. Ulrich summarized her ideas:

"While my experience has been largely confined to young women in colleges and normal schools, I am not in favor of introducing sex education into the elementary schools, as is now being agitated, where the girls have not reached the age of puberty. Touching my work I feel that its value lies in its impersonality. I mean that since I come a perfect stranger to a girl's institution, and chiefly in a consultative capacity, perfect confidence is shown me by my listeners, and they frankly confide, and ask advice in matters they have kept from their mothers and teachers. In many cases these secrets have eaten at the heart and life of a girl to such a degree as to induce utter lack of ambition in any life work or vocational future.

"It is my endeavor to diagnose such cases, and directing the morbid or warped outlook into some healthy channel of activity, to stimulate the natural tastes and interests."

HEALTH

MIKVEH BATHS OF NEW YORK CITY—BY W. A. MANHEIMER, LABORATORY, DEPT. OF BACTERIOLOGY, COLUMBIA UNIVERSITY

MIKVEH BATHS are located usually in the basements of tenements in the crowded sections of the lower East Side of New York city and in the West Side of Brooklyn, where they are patronized by Jewish people.

A charge of five cents is made for as long a stay as is desired. At certain times in the year (e. g., the Passover) their use is compelled by religious custom for both men and women. Women are required to use these pools regularly within seven days after menstruation. The Hebrew law is very strict regarding the method of using these baths, and states that after thorough cleansing, the person should immerse himself or herself in a purified plunge filled with uncontaminated water, i. e., rain-water, ice-water, or water that has not been polluted by human beings, and that this plunge should contain at least three cubic yards of water.

But these excellent laws are not carried out. The men and women in their respective pools wash themselves in polluted water, in plunges the capacities of which average 200 cubic feet, and which are used at times without change of water by as many as 300 different individuals. In connection with some of these Mikvehs there are either tubs or shower-baths, but neither of these is patronized to any extent because of an additional charge of five cents for use. Hence the same water is used over and over again, becomes contaminated, and in no sense fulfills the requirements of the biblical law.

Forty-one of these baths were examined in twenty-three different buildings. An inspector from the department of health was assigned to me by courtesy of the commissioner and we took an interpreter who could talk Yiddish.

The plunges are usually cast iron tanks, the bases of which are 6 by 10 feet and the depths 3 or 4 feet.

There are usually, in one building, several plunges containing water at different temperatures. The bathers go from the lower to the higher temperatures where they remain for several minutes till they have sweated, thus removing most of their dirt. When sweating rooms are provided bathers often prefer to use these in place of the Mikvehs. The temperatures of these plunges range from 18° to 50° C. After use the water is thick and slimy, the surface covered with scum from the bodies of the bathers, and a disgusting odor noticeable. The average attendance varies; in several instances 80 to 100 persons bathed in 200 cubic feet of water, while in one instance, 300 persons used a slightly larger pool.

The following article is part of a paper now in preparation on The Sanitation of Swimming Pools. The attention of the writer was directed to Mikveh baths by H. E. J. Porter, industrial engineer, who having made a preliminary study of them' believed that additional investigation and publicity would be productive of much good. All the data collected and used by him were turned over to the writer and used as a basis of comparison and control with the data reported in the table to be. The biblical data were furnished through the courtesy of Rabbi Hirschensohn of Hoboken, N. J.—THE AUTHOR.

There can be small wonder, therefore, at the very large bacterial findings (see table). The counts ranged from 1,000 to 3,000,000 bacteria per cubic centimeter, reaching, in fact, in one instance 18,144,000 bacteria in one cubic centimeter. The counts for colon bacilli are very interesting and astonishing. In the instance where 300 persons had used the water the bacterial count reached the enormous figures of 10,000 colon bacilli per cubic centimeter.

That these pools are a serious menace to the health of the people using them is clear. Radical measures to improve their condition or to substitute other means of ablution, should be immediate.

The neighborhoods where these baths are located are extremely crowded, and the tenements there are not equipped with bath-tubs. The people of these poor districts, therefore, must depend, either upon the very few public baths in their neighborhood, or these unsanitary Mikvehs. In spite of the fact that the latter do not comply with the Mosaic laws, their abolition would be strongly op-

posed by the Jewish people who bathe there. The writer, however, believes that several recommendations could be made which would insure cleanliness and at the same time permit the exercise of the required religious ritual. These are as follows:

1. Basements of public schools could be modified into public shower-bath rooms. The authorities of many foreign cities have done this with success and have encouraged the use of these showers, not only as a regular part of the elementary school instruction, but also as a means of bathing for the general public. Such baths have been established in several public schools in New York city, but their use has been restricted to students. The operating of shower-baths for adults would be in beneficial competition with the Mikvehs, especially if the baths were free of charge.

2. That this plan is feasible and economical is unquestionable. It is preferable to the erection of new buildings because of the high cost of land, the cost of erection, and the duplication of running expenses, such as salaries for janitors, cleaners, and the like. The basements of public schools are at present frequently used for recreation purposes for which the roofs would be far superior. The use of the basements, or part of the basements, in the evenings, for shower-bath rooms, would work a great benefit to the people of these crowded districts and would operate to reduce the cost of public baths.

3. Jewish charities should be encouraged to establish sanitary bathing places free of charge, either in connection with Synagogues or otherwise.

4. Settlements in the vicinity should make an effort to install showers for the adults of the neighborhood.

5. Because a fee is charged, these baths are licensed by the city, and through this licensing power the city could compel the enforcement of sanitary laws. Such laws should include the following requirements:

All Mikveh plunges should be abolished, because of their unsanitary and polluted condition. Mikvehs consisting of individual tubs might be substituted in their place. It will be remembered that Mikveh plunges are used for cleansing purposes and are necessarily dirty. They differ, therefore, from swimming pools in which a larger quantity of water is used and for swimming only.

Shower-bath establishments, with or without sweat-rooms, because of their cleaner nature, should be fostered. A reduction of their license fee might encourage their increase.

All individual tubs should be cleansed after each bath. Failure to observe this precaution, should cause forfeiture of license.

SUMMARY OF BACTERIOLOGICAL TESTS (Condensed and modified.)

1. BACTERIAL COUNTS.			No. of Plunges
Bacteria per c. c.	1,000 found in...		2
Between 100 and 1,000 "	10,000 "		7
" 10,000 "	100,000 "		7
" 100,000 "	500,000 "		10
" 500,000 "	1,000,000 "		4
1,000,000 or above	"		11
Total plunges examined....			41
2. COUNTS FOR COLON BACILLI.			No. of Plunges
Colon bacilli per c. c.	0 found in....		3 ²
Between 1 and 10 "	100 "		7
" 10 " "	100 "		6
" 100 " "	1,000 "		13
" 1,000 " "	10,000 "		11
10,000 or over	"		1
Total plunges examined....			41

²As colon bacilli are constant inhabitants of the intestinal canal, their presence in water is an indication of fecal contamination.
³Attendance less than 10.

ADULTERATED WITH WOOD ALCOHOL

These preparations, which have caused suffering, blindness and death, would have been made illegal had the Griffin bill passed the Senate of New York state.

PHILADELPHIA BUREAU OF HEALTH HELPING IN SOCIAL SERVICE—BY ELLA D. HARRIS

SOCIAL SERVICE DIVISION, DEPARTMENT OF PUBLIC HEALTH AND CHARITIES

TO VISIT THE HOME of every patient admitted to the tuberculosis wards of the Philadelphia General Hospital, proved too big a task for the small staff of the social service division. A plan was therefore worked out by which every case not only of tuberculosis, but of all other reportable diseases admitted to the hospital, is referred first to the medical inspectors of the Bureau of Health who make the preliminary home inspection. The reports returned to the social service give a complete census of the household, whether tenement or lodging house or private house, with the age, occupation and health of each person.

In addition, they note home conditions needing attention, such as overcrowding, nuisances, extreme poverty, or sick persons receiving no medical attention. This plan has now been in operation for almost two months, and the results have been most satisfactory.

Formerly a case was referred to the social service division when, from the hospital point of view, social conditions were bad. Now reports come from a new angle, and the field is covered thoroughly.

The scope of these home inspections is shown by the fact that the Philadelphia General Hospital is the only one accepting patients with the following reportable diseases: Chicken-pox, erysipelas, measles, mumps, pertussis, scabies, trachoma and ophthalmia neonatorum. Other hospitals take patients with pneumonia, typhoid and tuberculosis, but the Philadelphia General Hospital has the largest number of beds for tuberculous patients,—310 for men and 70 for women.

It was expected that the medical inspectors, all graduate physicians, would give adequate reports upon the health of each member of the household and the sanitary arrangements of the house, but they have gone further than that. They indicate with great care conditions of unusual poverty or neglect of children. The return on one inspection had this important note:

"Would suggest that someone look

into the matter of Harry, white child, two years of age, being reared by colored family, bad surroundings."

The relation of overcrowding to the spread of infection is very apparent in every one of the reports. Two children with measles were found to have come from a very dirty tenement. Their mother had been sent to the Municipal Hospital with the baby who had diphtheria, and two other children left at home were in need of medical attention.

Another family of recent immigrants, from which a case of erysipelas was admitted to the hospital, had eight adults and five children living in four rooms on the second floor of a tenement house. This necessitated two beds in the kitchen, which was small and dark.

Many of the men with tuberculosis, pneumonia or erysipelas come from lodging-houses or missions. Typical conditions in the latter are indicated by the significant words of the inspector:

"As a mission and shelter for homeless men, it may be a place doing good work, as a lodging house it must be overcrowded at night and insanitary."

Inspection of a den in Chinatown, from which one of our Chinese tuberculous patients came, was not possible without police help. Sometimes in addition to the services of the hospital social worker, a relief agency, doctor, nurse and sanitary inspector must all be called on before conditions can be righted. The following statement led to such a joining of forces:

"Six adults and nine children were found to be living under grossly insanitary conditions. Two women and one boy, members of the family who lived on the first floor, were found sick in bed, and no one to take care of them with the exception of a little girl."

A later report on this case is as follows:

"A reinspection was made today and as per instructions given the owner and tenants, the house was vacated and preparations are being made for the general overhauling and re-

pairing of the entire drainage system and cleaning up the premises. I have arranged to have the house thoroughly disinfected tomorrow. For your further information, would say, that this family has moved to 609 M. street. This office will endeavor to see that they do not create any insanitary conditions at this address."

RECENT FICTION: "POISONED NEEDLES"

THE *Journal of the American Medical Association* does us all a service by publishing the truth about "poisoned needles."

It reminds us of the vogue of hypnotism which followed the publication of *Trilby*—how Svengali with his hypnotic eye at once became a real and possible person in the public imagination. Newspapers were full of stories of girls and women who had suddenly become fixed and paralyzed by the hypnotic gaze of some mysterious stranger, and who had been compelled by his will to do things that horrified them. It was used as a plea in criminal cases, the culprits saying that they had been hypnotized and forced to do unlawful acts. Yet every scientific man knows that hypnotism has very definite limitations, that nobody can be hypnotized unknowingly or against his will and that few are so susceptible to hypnotism that they can be compelled to perform acts beyond their own volition and knowledge.

Another popular fiction which later on took the place of hypnotism was that of instantaneous anaesthesia. A cloth or a handkerchief pressed for a moment over the mouth, or chloroform sprayed into an open window, or a chloroform soaked rag thrown into a bedroom, were supposed to cause immediate unconsciousness in the victims. Anyone who has ever seen the difficulty of putting a patient under an anaesthetic even under the most favorable conditions and with every possible means of controlling him knows how absurd such stories are.

The latest variation of these exciting fictions may be found in the poisoned needle stories which have been going the rounds of the press. A woman goes to a moving picture theater, enters a crowded elevator, a street car, or an elevated train, or is caught in the press of a crowd. Suddenly she sees beside her our old friend the mysterious stranger with the compelling manner. At the same time she feels a sting and knows that she has been stabbed with a "poisoned needle," charged with some mysterious South American drug. She immediately becomes unconscious or dazed and irresponsible for a longer or shorter time, during which she goes through a number of marvelous adventures and hair-breadth escapes.

It is not possible to say that no woman was ever without her knowledge given a hypodermic injection of a drug which produced unconsciousness. However, it can be said very positively that there is no drug known to the scientific world which could be administered in the manner described in recent newspaper reports, or which would produce the effect that they claim.

GREATER CARE IN OPERATIONS FOR REMOVING TONSILS

A RECENT STUDY of the methods now in vogue in New York for operations for the removal of tonsils and adenoids, showed that these methods were very inadequate and the results most unsatisfactory. A special investigation was made by Dr. Gerard H. Cocks for the State Charities Aid Association. In consequence of the facts which Dr. Cocks' investigation revealed, the Public Health Committee of the New York Academy of Medicine called a conference of various representative bodies to consider the situation. That conference passed the following resolutions:

RESOLVED, That it is the sense of this committee that all operations on the tonsils should be performed in hospitals or in such dispensaries as are provided with operating rooms and with recovery ward facilities.

RESOLVED, That private hospitals of the city be requested to co-operate with the Health Department of the city in the operative care of children with enlarged tonsils and adenoids; that these hospitals provide proper and adequate facilities for such cases and that the city compensate the hospitals for this special service; and, further, that the public hospitals be requested to provide similar facilities, without special compensation.

IS INFECTION CARRIED IN THE AIR?

THE OLD IDEA was that most diseases were carried by the air. Typhoid fever came from breathing sewer gas, so did diphtheria and cholera. Malaria came from the white mists which rise from swamps morning and evening. Yellow fever and typhus were carried by the air of ships and jails and hospitals.

Later on, influenza and scarlet fever were supposed to be caused by a massive infection of the atmosphere. Not so long ago people were hanging sheets dipped in carbolic acid before the door of a sick room just as some centuries ago they used to sprinkle the streets with vinegar and burn aromatic wood to rid the city of plague. The earliest followers of antiseptic surgery depended on the use of the carbolic spray to cleanse the air even more than on cleanliness of hands and instruments.

Dr. Charles V. Chapin, superintendent of health, Providence, R. I., has written an interesting paper for the *Journal of the American Medical Association*, in which he shows how the theory of air-borne infection has lost ground year by year until now tuberculosis, and possibly anthrax, are the only diseases left in which air is believed to be an important factor in carrying infection.

Cases of diphtheria, scarlet fever and measles are now treated in the general wards in the Providence Hospital, as well as in many foreign hospitals, and the precautions which are taken are against contact infection from patient to patient or through the hands of doctors and nurses. Even smallpox seems not to be carried by the air, at least no good proof is offered of the spread of smallpox around an isolation hospital or an

From a chart prepared by the Massachusetts Association for the Relief and Control of Tuberculosis

The chart tells a splendid story of results for the fight against tuberculosis in Massachusetts. In 1850, the death rate from tuberculosis was 47— for the state, 40— for Boston alone. Today it is 13— for the state, 14— for Boston. Active causes in this decline of the death rate have been Koch's discovery of the tubercle bacillus, and recent efforts of both public and private organizations, such as the State Board of Health, the Massachusetts Association for the Relief and Control of Tuberculosis, the Boston Consumptive's Hospital Department.

The state maintains in all 1,654 beds for tuberculous patients. These are in special hospitals, in the State Infirmary, State Insane Asylum and the Prison Hospital. Local institutions have 792 beds; private sanatoria, 569—in all 3,015 beds within the state. The general, well-defined policy of the state is to provide for incipient cases in the state hospitals, leaving the care of advanced patients to municipalities with state aid when necessary.

As a result of special studies recently completed new legislation is now pending. It will give full power to the State Board of Health for inspection and supervision of institutions, for enforcement of rules and regulations, for ventilation, removal of wilfully careless patients, and for devising a system for district nursing both in cities and in towns.

infected house, except by contact with the infected person.

Of course it will be a good while before the public as a whole will accept this view, but meanwhile the doctors will go on regardless of the public and will greatly simplify our care of communicable diseases.

COURSE IN TROPICAL HYGIENE

According to the *London Hospital*, a course in tropical sanitation and hygiene will be added to those conducted by the London School of Tropical Medicine. The first of the two annual courses now proposed will start on May 1, and the second on October 1. Each will extend through eight weeks. The subject will be interpreted to include such important topics as the care of the sick on board ship in the tropics, port hygiene, surveying and sanitary engineering, medical entomology, and bacteriology. Practical demonstrations will be frequently held that the course may not be merely theoretical.

BETA RAYS AND CANCER

Public interest in the radium treatment for cancer continues to be very great, though reports of one or two rather striking failures have come to perplex us. One explanation for these failures has been offered lately by Dr. Robert Abbé, who tells us that experiments made by Dr. Alexis Carrel in the Rockefeller Institute seem to show that the different emanations from radium have not been rightly understood up to

now. Dr. Carrel has been testing the effect of the different rays on tissue growth, and has found that the so-called "beta" rays which have been heretofore looked upon as dangerous and have been kept away from the patients as much as possible, really have a more retarding effect on cell growth—and therefore probably on cancer growth—than the "gamma" rays, so far generally relied upon. Dr. Abbé is testing these beta rays, on simple warts only for the present, and he hopes to be able to clear up the confusion as to the properties of these rays.

RADIUM IN CANADA

It is announced that a government bill has been introduced into the provincial Legislature, offering a reward of £5,000 for the first discovery of radium in the Province of Ontario, Canada.

A STUDY OF GARBAGE DISPOSAL

An interesting contribution to the study of sewage and garbage disposal made by the bureau of foreign and domestic commerce of the United States Department of Commerce, has been issued in pamphlet form under the title *Scientific Sewage and Garbage Disposal*.

The pamphlet summarizes consular reports concerning European cities of 50,000 population and upward, which make some attempt at sewage purification. This excludes nearly all the municipalities of southern and eastern Europe. No reports were asked for from London, Berlin or Paris.

Boyhood and Lawlessness on *the* West Side of New York

Boyhood and lawlessness—kids and cops on asphalt streets—are at the very heart of the "West Side Problem." A study of them has been made under the direction of Pauline Goldmark for the Bureau of Social Research of the New York School of Philanthropy, and is to be brought out soon as a Russell Sage Foundation volume. The pictures by Lewis W. Hine show boys rowing with a policeman, parading, shooting craps, boxing and, in the center, organizing for the Junior Giants."

HALVING THE TAX RATE ON BUILDINGS

TO THE EDITOR: I believe it will be many a day before the state of New York will enact a law reducing the tax on improvements and buildings, and laying an additional tax on the value of the land.

The single taxers are of the opinion that the trouble of unemployment would cease if their doctrines and theories were enacted into law. They lay the trouble of unemployment entirely on the present methods of taxation.

Others, as well as single taxers, are troubled with this problem of unemployment. Whether or not single taxers are right in their theories, I think the people would be willing, perhaps, to lay a tax, a special tax, a separate tax, on the land only, on land values, to cover the expenses the state would be put to "by giving employment to all those that are unemployed at any time."

It would be, in my opinion, a compromise measure that might go through the Legislature. Even if there is only a suspicion of truth in the theories of the single taxers, and even if there is no truth in them at all, it would not harm the landed interests very much to tax them on the value of their land for the cost of giving the unemployed work. I do not think there would be much opposition on the part of land-holders to such a measure.

SELMAR HESS

New York.

TO THE EDITOR: Professor Seligman's arguments against the Herrick-Schaap bill are substantially the same as he voiced before the Board of Estimate at the public hearing held not long since. The mere fact that he is a very able teacher of college economics would, no doubt, influence very many to accept his opinion in preference to their own judgment.

However, when we consider how very wide a divergence there is among college professors of economics, the question arises whether they are any more fit to act as guides in sociological matters than the average intelligent layman who has studied such problems.

Prof. Alvin S. Johnson, professor of political economy at Cornell, says in a recent number of the *Atlantic Monthly* that all the social heresies find their exponents among political economists high in their profession, all of which might tend to make one doubt whether political economy is really a science at all, or, if it is, whether the aforesaid professors have a speaking acquaintance with the real thing.

Professor Seligman's arguments rather tend to confirm this view, since some of his premises and conclusions do not

square with either the fundamentals of political economy or the facts of the case, while his logic at times is mixed to the extent of self-contradiction. At one point he says that the passage of the bill would result in over-production of buildings, and at another, that it would retard building and keep land out of use.

His citing of the Vancouver building permits failed to disclose one very important fact, and that was that while there was a considerable shrinkage in the total value of building permits between 1911-1913, that in the latter year the number of permits per capita were much larger than before, and that is very much more important for the general welfare than the erection of a limited number of buildings of very high cost.

In the opposition to the Herrick-Schaap bill one thing is very apparent, and that is that the great majority of those who are frantically fighting it are actuated solely by the immediate money interests which they think are endangered, while most of those who are supporting it are doing so simply from a conviction that it will benefit the community. In other words, there seems to be an utter lack of understanding on the part of most of the bill's opponents that there is anything else to fight about excepting self-interest.

MABEL C. KITE.

[Social Worker.]
Stamford, Conn.

TO THE EDITOR: Will you grant space for a reply to some of the fiscal objections urged by Professor Seligman in your columns against halving the tax rate on buildings in New York city, or completely untaxing them? He says of the fiscal aspects: "In considering these we must bear in mind that while land values will be lowered, land rents will not be less than before."

Of course, facts are not ruled out in this discussion.

In 1913, the assessed values of New York city were \$1,223,658,604 greater than in 1906, although the tax levy on land values was increased by \$33,451,834 during these eight years. The stupidity of claiming that an increased levy of about \$20,000,000 on land values will decrease the assessed value of land is apparent. It might prevent the usual increase.

Even with the heavy taxes on buildings, the assessed value of buildings in the city increased, during this period, by \$837,165,390, a total increase in the assessed value of ordinary real estate of \$2,060,823,994.

Professor Seligman inadvertently admits this point earlier in his statement: "The enlargement of the buildings zone, therefore, will cause land rents to rise throughout the city." Professor Selig-

man knows that land values are merely land rents capitalized. He neatly disproves his own charge that land values will be reduced, inadvertently demolishing his claim that the land value of the little home owner would be thereby wiped out. He also admits that more buildings will be constructed.

New York's great borrowing capacity, which Professor Seligman defends and wishes to conserve, is, however, a serious menace. The city's net funded debt on December 31, 1913, was \$898,013,401, an increase during the past eight years of \$467,457,001. The city paid in interest in 1913, \$45,721,775, over six-sevenths of the total taxes on buildings.

During these eight years, the ownership of land was worth to the lucky owners, including ground rent (calculated at 6 per cent upon full value) and increase in land values, at least \$3,251,000,000. Land owners paid in taxes and assessments on land less than \$590,000,000, while during this period, the city paid over \$234,000,000 interest on the city debt, but paid off less than \$64,000,000 of the debt.

Professor Seligman is right. "Land rents will not be less than before" when land values are taxed more heavily, but land owners' share will be less, and the people's share more. We can appropriately and easily stop our stupid orgy of indebtedness, of which Professor Seligman is inexplicably an advocate. The people will get the advantages of having apartments and homes taxed less, by taxing land values more.

BENJAMIN C. MARSH.

[Executive secretary, Society to Lower Rents and Reduce Taxes on Homes.]
New York.

TO THE EDITOR: Let me touch only on certain portions of Professor Seligman's article which seemed to me characteristic of its logic, its accuracy—or lack of them—and its point of view generally.

As to logic, Professor Seligman tells us several times that land rent is determined by population. No one disputes this, but how does Professor Seligman reconcile it with the statement made elsewhere in this article that an increased tax on land values will diminish the rental value of land? If population determines the rental value of land, what has the tax to do with it?

And again, in concern for the modest house owner in the suburbs who is a land speculator in an equally modest way (according to Professor Seligman) the professor reiterates the statement about diminishing the rental value of land by the tax as proposed and his fears that it would keep back building. But scarce a half-page further on we find him stating that the change in taxation advocated by the Herrick-Schaap bill would stimulate building and push out the building periphery, which in turn would cause land rents to rise throughout the city. Why then should the modest speculator on the periphery worry about the Herrick-Schaap bill? Furthermore, in speaking of Vancouver, Professor Seligman says: "The whole system of land value taxation is playing right into the hands of the land speculator." And as we are speak-

ing of Vancouver I would respectfully call Professor Seligman's attention to the fact that they have not yet got the single tax in Vancouver.

On the further count of logic, Professor Seligman states that he does not altogether disagree, in theory, with the suggestion to take some part of land values for local revenue, but that he favors rather an unearned increment tax, because it deals only with future values, while the Herrick-Schaap bill deals with present values. Now the present values of today were the future values of yesteryear, and the future values of today are the present values of tomorrow. If it is right to take them tomorrow, why is it not right to take them today?

And as to the count of accuracy—Professor Seligman tells us that the Herrick-Schaap bill favors our rich men who build fine mansions on Fifth avenue, at the expense of the small house owner. In his own words "our more sumptuous residences are precisely those that cost more than the land on which they stand." Are they? Here are a few figures from the latest Tax Department lists concerning three excellently typical examples of millionaire mansions on Fifth avenue:

Mrs. Cornelius Vanderbilt's house northwest corner Fifth avenue and Fifty-seventh street; land, 200 by 135 feet, assessed at \$2,950,000; house, 5 stories, cov. 143 by 125 feet, assessed at \$400,000.

Huntington house, southeast corner Fifth avenue and Fifty-seventh street; land, 85 by 175 feet, assessed at \$1,550,000; house, 5 stories, 65 by 160 feet, assessed at \$250,000.

John Jacob Astor residence, 840 Fifth avenue; land, 125 by 150 feet, assessed at \$1,300,000; house, 4 stories, 125 by 100, assessed at \$600,000.

There are any number more but these are typical.

Then there is another matter which has to do with the ethical side of the question. Professor Seligman grants us that the Herrick-Schaap bill might in a measure decrease congestion as to room in our city, but says that it would bring about a congestion as to acre which in his mind is just as bad as the other. It hardly seems credible that a thinking man, in this day and generation, could make such a statement.

Does Professor Seligman realize what room congestion means? Does he realize what it means to have anywhere from five to fifteen human beings living in one room, with no privacy, with no decency, without opportunity to develop any trait that differentiates man from the brutes? We can see this condition in our slums quite frequently and we can see the results to our city in the night courts, in the police and hospital annals. Surely no one who has studied this matter can say that any other condition is preferable to room congestion.

All this while I have said nothing about the merits of the Herrick-Schaap bill. But oftentimes the fallacy of the arguments used against a measure are the best argument in its favor.

GRACE ISABEL COLBRON.

New York.

TO THE EDITOR: Although the title of Professor Seligman's article in your issue of March 7 is Halving the Tax Rate on Buildings, he rarely mentions his subject, but instead, invokes the bugaboo of the single tax. Do not these tactics constitute an admission that he cannot oppose the Herrick-Schaap bill on its merits?

As Commissioner Murphy very aptly points out in the same number, single tax means the total abolition of all taxation, federal, state and local, and the raising of revenue by taking the entire ground rent. In New York city the single tax would mean the annual collection of about three hundred million dollars from land values, which are now paying only eighty-three million dollars. The Herrick-Schaap bill provides for a vote of the people on the question of making land values pay nineteen and a half million dollars more. This is the proposition which Professor Seligman did not meet.

He claims, however, that if the Herrick-Schaap bill were passed, that would be merely the beginning or entering wedge, and that after the dire results that would be caused thereby the people would demand greater reductions of taxes on buildings, and greater increases of taxes on land. It is no wonder that he does not consider his article a scientific discussion, but refers us to his work on *The Shifting and Incidence of Taxation*.

It is not remarkable, therefore, that Professor Seligman opposes a referendum on this question. Of course the people will be fit to vote on a new constitution next year, which may involve hundreds of changes, but they are clearly unfit to vote on this simple question: Shall the city of New York tax land values more than labor values? Perhaps, however, his fears are justified; for voters who, after being ruined by the Herrick-Schaap bill, will run double quick to the single tax, are surely not fit to vote on any question or for any person.

A few comparisons will show that he does not consider his article a scientific discussion of either the Herrick-Schaap bill or the single tax. At one place he says that "if buildings are exempted from taxation there will manifestly be every inducement to prospective builders to enlarge their profits by increasing the height of the buildings * * * as a result, the old and low buildings in the slums will be replaced by high apartment houses, each of which may house two or three times as many people as before."

He also says that "most houses are built now-a-days on building loans, and the amount of the loan, as well as the rate of interest, is in certain proportion to the value of the land. If the increased tax on the land diminishes its value, either less money can be borrowed or a higher rate of interest will have to be paid, and in either case there will be an impediment to the erection of new houses." Professor Seligman might have put his proposition more briefly: The cause is an impediment to the result.

The so-called single tax in Vancouver looms large in Professor Selig-

man's eye. As a matter of fact, Vancouver never adopted the single tax, and although improvements there are now entirely exempt from taxation, land values are taxed at a lower rate than they are in New York city. The entire exemption of improvements was adopted in 1910, in which year the building permits amounted to about thirteen million dollars, and increased to seventeen million dollars in 1911, and nineteen million dollars in 1912. Professor Seligman gloats over the fact that they dropped to ten millions in 1913. He probably does not know, however, at least he fails to note, that the figures for 1913 are three times as great as those for 1902, when buildings were still taxed. He also fails to note that although both land and building values in Vancouver have increased more than 500 per cent since the policy of partially exempting improvements was adopted, rents in that city have decreased 15 per cent, and the wages of ordinary laborers are three dollars for an eight-hour day, with no unemployment.

He also ignores the experience of Houston, Tex., which has begun to exempt improvements from taxation. In two years the population increased enormously, as did both improvements and land values, but rents fell one-sixth; and the tax commissioner writes that there are no unemployed in that city.

Professor Seligman claims "that the more sumptuous residences are precisely those that cost more than the land on which they stand." Again does he demonstrate the admittedly unscientific nature of his article, for a perusal of the assessment rolls would have shown him that the great majority of the mansions on Fifth avenue and Riverside drive will pay more taxes under the proposed system than they pay today; for the land is more valuable than the improvements.

So, too, with the exception of perhaps a half dozen skyscrapers, there is no large office building that is not worth less than its site. But the owners of the half dozen are active in opposition to the Herrick-Schaap bill. According to Professor Seligman, they should favor it. Having studied the subject scientifically, however, they realize that they will lose more in the reduction of rents than they will gain in the reduction of taxes.

"What we need in our large cities is more revenue not less revenue." I heartily endorse this, and I am glad to have found one statement in the article with which I am in accord. Our present system of discouraging the erection of more buildings by penalizing people who have the temerity to attempt it, *does* reduce our natural taxable base. With more buildings and more people to occupy them, the greater the land values.

Professor Seligman claims, however, that the reduction of the rate on improvements would endanger the constitutional limitation of indebtedness, which is 10 per cent of the assessed value of real estate. He does not attempt to prove it, but merely admits it. The constitution states that such indebtedness shall not exceed "ten per centum of the assessed valuation of the real

estate of such county or city subject to taxation." Under the Herrick-Schaap bill, at the end of five years, on the basis of the present budget, the rate on land would be about 2.20 and improvements about 1.10. Are they not both "subjects of taxation"?

Professor Seligman suggests "two remedies" for congestion: increased transportation, restriction of height and depth of buildings, broad streets and more parks and playgrounds. It is unfortunate for his attitude as a friend of the poor that each of these suggestions, if adopted, would increase the land owners' profits. The land owners will be glad to sell their land to the city for parks, playgrounds and wide streets, at several times the assessed value, and those who are not fortunate enough to own the sites selected would benefit in the increased value of their land. I think that the various land speculators' associations and their coadjutors in Wall street, who welcome city bond issues and who own and have their offices in the skyscrapers that the professor claims should, but do not, favor the Herrick-Schaap bill, will heartily second his suggestion.

The gist of Professor Seligman's argument is in the sentence: "Heavier taxation of land values than of buildings is confiscation." Of course, he is entitled to his opinion on this, but so is every other voter who creates land values. The only way 99 per cent of the voters can record their opinions is by a referendum.

FREDERIC CYRUS LEUBUSCHER.

[President, Society to Lower Rents and Reduce Taxes on Homes.]

New York.

TO THE EDITOR: Professor Seligman has started his article in your issue of March 7 by stating that the agitation in favor of the Herrick-Schaap bill has been "ingenuously managed" to "identify it in the popular mind" with a project for lowering rents. The Herrick-Schaap bill will reduce rents and Professor Seligman admits it later on in his article, although he questions to what extent they will be lowered. We, therefore, do not think that the implication contained in this sentence is just or fair.

The reason why no mere building boom will occur, as Professor Seligman fears, was pointed out to him at a hearing before the special committee appointed by the Chamber of Commerce to look into the merits of the Herrick-Schaap bill, and neither then, nor in his article did he make any reply to the facts presented. Aside from the wearing out of old buildings, and the necessity for better buildings due to improvements in the art, the only reason for the erection of new buildings is the increase of population. If the Herrick-Schaap bill were in force, people in the slums would no longer be forced to crowd many into one room, or many families into one apartment, but they would occupy considerably more space than at present. It is a conservative estimate that each individual would occupy twice as much space. Consequently, the increasing population would continue to require twice as much building as here-

tofore, provided the increase in population continued the same.

It will therefore be seen that far more building would go on under the Herrick-Schaap bill than before, even after the present needs of the city had been provided.

While in the first part of his article Professor Seligman declares that there would be a building boom, followed by a collapse, and that there would then be no greater amount of building than at present, later on in his article he points out that the removal of the tax from buildings would cause the city to be built up solid with lofty apartments, and adds that we would soon have a "repetition throughout the whole length and breadth of the city" of conditions that we find in Manhattan. These two statements do not completely harmonize, and we think the correct conclusion is that they are both in error.

Again, the professor argues elaborately on the relative merits of congestion per room and congestion per acre, and represents that if anything, he believes congestion per acre is the worst of the two. May we suggest that the growth of tuberculosis in the city, for example, is caused much more by congestion per room than by any other cause? The habits of people living where congestion per room is the order of the day, are apt to be neither sanitary, moral, honest or in any way praiseworthy, although this is through no fault of their own but due entirely to the environment in which they live.

Professor Seligman points out that, in his opinion, the Herrick-Schaap bill would produce congestion per acre, high buildings, buildings close together without any garden space, land advantages for the rich and against the poor, high rents in the centre of the city, a gradual change from private house owners to apartment dwellers, and similar evils.

We wish to call Professor Seligman's attention very strongly to the fact that the present system of taxation in New York city, as it exists today, has caused the very evils which he predicts, in a more aggravated form here than in any other spot in the world, and yet Professor Seligman asks us to stick to our present system which experience has proved does cause these evils rather than change to another, which, in the opinion of many who have studied the matter carefully, would decrease these evils.

Professor Seligman has offered no satisfactory alternative proposition to the Herrick-Schaap bill, and consequently he is presumably satisfied with present conditions, including congestion per room, high buildings, and the rest.

Personally, we think that the settlement of so simple a question as to whether labor and land shall be taxed at the same rate, had better, under the circumstances, be referred to the people, as required by the Herrick-Schaap bill, especially in view of the fact that Professor Seligman has, as yet, made no objection to their voting next year on the delicate points involved in a new constitution.

E. VAIL STEBBINS.

[Vice President, Business Men's Association to Untax Industry.]

TO THE EDITOR: To judge from the asperity of the attacks on my modest contribution, I feel almost as if I had fallen into a hornet's nest. The stings are, however, less virulent than they seem to be, either because my hide has been a bit toughened by a long experience or perhaps because the poison is a little less venomous than it appears. As the communications seem to have been prepared according to a concerted scheme, whereby each writer takes up successively different points, an adequate rejoinder would necessitate an essay of at least as much bulk as the original. I shall therefore content myself with a few reflections. And I shall not endeavor to vie with the writers in personalities or in courteous charges of stupidity, ignorance, lack of logic, inhumanity and the like, with which the letters are replete.

In the first place, let me call the attention of my critics to the fact that a sound criterion of criticism is clearly to understand what the person criticised actually states. Thus the gravamen of several of the objections is that I assert one thing on one page and the opposite thing on another page, as for instance that buildings will increase and not increase, or that land values will fall and rise, etc.

A careful perusal of my paper would show that in the one case I was discussing a hypothesis and in the other a fact. Thus, in answer to my opponents' statement that more houses would be erected, I argue first on that hypothesis and contend that if more houses are built, the result would be only a temporary boom; whereupon secondly I leave that hypothesis and state my reasons for believing that as a fact more houses will not be built. So again, in reply to the argument that rents will fall, I contend that if the building zone would be enlarged by reason of the change in taxation land rents (and land values) would rise; but since I take the position that the hypothesis is untenable and that the building zone will not be enlarged (for reasons that I give) I conclude that as a fact land values will not rise, but on the contrary fall, because of the capitalization of the increased tax on land. A little more attention to the exact steps of my argument would have obviated a large part of the criticisms.

To come now to the specific points which do not rest on the above misconceptions. One writer maintains that the new law will enable each individual to occupy on a conservative estimate twice as much space as at present, and that there will therefore be a permanent need for twice as many additional buildings every year. That is to say, he asserts that after the present fringe of boarders and lodgers come to occupy apartments of their own (which he thinks will be the effect of the bill), not only would every possible future boarder or lodger permanently occupy such apartments, but every tenant that now occupies for himself 2, 3, 4 or 5 rooms would in the future occupy 4, 6, 8, or 10 rooms of the same size, and for every man who now builds a 10 room house to live

in, there would be a man in the future to build a 20 room house.

It would follow that if the tax on buildings were completely removed, instead of being only halved, every tenant would occupy from 8 to 20 rooms, and every owner build a 40 room house. But this we are told, is a conservative estimate; so that if we desired to be simply normal and not conservative we should be justified in looking forward to the tenants occupying apartments up to 40 rooms, and owners building houses of from 60 to 80 rooms. And all this would be the result of a change in taxation. Surely, great is the power of generous enthusiasm!

Another critic quotes Professor Johnson to the effect that economists differ about almost everything. But she fails to quote the real point sought to be made by him, namely that notwithstanding disagreements on well nigh every possible subject, there is not a single economist of note who approves, or who has ever approved, of the single tax. We may have our sins, but that heinous charge at all events cannot be laid at our doors.

Another fair critic thinks that there is no difference in principle between the unearned increment tax and the Herrick-Schaap bill, because the future value of today is the present value of tomorrow. But she fails to realize that if I invest my money today on ample notice of what is to happen tomorrow, this is a very different proposition from having allowed me to invest my money in the past *without* notice of what will be done today. It makes all the difference between taxation (which can be allowed for) and confiscation.

Still another critic selects certain houses on Fifth Avenue which stand on plots which are considerably larger and more expensive than the houses. If he had selected some of the many houses which, as is customary in New York, occupy as much of the plot as the law allows and which are none the less of a costly and luxurious nature, the figures would have been very different.

Several of the writers credit me with the delightful doctrine that I favor overcrowding. What I said was that the bill in question would in my opinion not appreciably relieve congestion per room, and would surely increase congestion per acre. The first result is problematical, the second result is certain—so certain, in fact, that not a single one of the critics has even attempted a reply thereto. My point is this: is it wise to endeavor to secure a very doubtful relief from one kind of congestion at the cost of a certain increase of congestion of another kind; especially when better methods are possible to secure the reduction of both kinds?

Many of the critics refer to Vancouver. They now take refuge in the statement that even if there has been a great falling off in building permits more houses are being built than 10 years ago; but they tell us nothing as to the comparative ratio, now and then, of houses to population and wealth. Nor do they compare Vancouver with other Canadian cities, or even with American cities across the border. Were this the

proper place to do so, interesting figures might be presented to show that the change in tax methods in Vancouver had virtually no effect one way or the other, and that all the alleged consequences can be duplicated in cities of a similar economic position where no such changes in taxation took place.

My critics are of two classes—the professed single taxers and the social workers. With the single taxers it is useless to argue—for no argument can change the burning enthusiasm of the zealot. To the social workers, however, I would say: do not play with fire. Every tax scheme is a fiscal as well as a social proposition, and whatever its social implications, it remains primarily a fiscal matter. Do not let your zeal for social reform run away with your appreciation of the fiscal considerations; and before you take a public position on the subject, decide to make as profound a study of public finance as you have already made of social reform.

EDWIN R. A. SELIGMAN.
[Columbia University]
New York.

SUBJECTS WANTED

TO THE EDITOR: Your readers are asked to suggest to the committee on organization of the National Conference of Charities and Correction for 1915, such topics of special interest as they would like to have discussed at that conference. Will they please send suggestions promptly, direct to the chairman?

HOMER FOLKS.
105 East 22d Street, New York.

TO THE EDITOR: In my note on juvenile courts in THE SURVEY for December 27, 1913, I sought to emphasize the direction which the development of the court might conceivably take in the future.

In connection with the item, Judge Ben. B. Lindsey of Denver calls my attention to the fact (which I knew) that covering a period of ten years he has had a woman assistant sitting with him in all girls' cases and that these cases are heard in private. Judge Lindsey argues that inasmuch as he is sitting as a chancellor he has the power, regardless of any express provision of law, to designate a woman to hear just such cases. He makes the further point that the court over which he presides is clothed with ample civil and criminal jurisdiction to reach all of the cases referred to in the item by me and is actually doing so.

In the light of the foregoing, it may appear as if I have done the Denver court an injustice in referring to the Chicago court in the item, and to the extent to which any injustice may have been done the Denver court I want expressly to correct it. Aside from the work that Judge Lindsey is doing in Denver, the whole juvenile court movement is indebted to him far too much for any of us interested in the movement to detract, even in the slightest degree, from what he has done and is still doing.

BERNARD FLEXNER.
Chicago.

Calendar of Conferences

APRIL AND MAY CONFERENCES

ADVANCEMENT OF COLORED PEOPLE, National Association for the Baltimore, Md., May 3-5. Sec'y, Miss May Childs Nerney, 70 Fifth Avenue, New York.

AGRICULTURAL COMMISSION OF THE AMERICAN BANKERS' ASSOCIATION, Hot Springs, Va., April 30-May 1. Chairman, B. F. Harris, Champaign, Ill.

BACKWARD, TRUANT, DELINQUENT AND DEPENDENT CHILDREN, National Conference on the Education of. Memphis, Tenn., May 6-8. Sec'y, F. Leslie Hayford, 274 Boylston St., Boston, Mass.

CHARITIES AND CORRECTIONS, Arkansas State Conference of. Fort Smith, Ark., May 5-6. Gen. Sec'y, Murray A. Auerbach, City Hall, Little Rock, Ark.

CHARITIES AND CORRECTIONS, Colorado State Board of. Denver, Colo., May 12. Sec'y, William Thomas, State Capitol, Denver, Colo.

CHARITIES AND CORRECTION, Connecticut State Conference of. Bridgeport, Ct., April 26-28. Gen. Sec'y, Charles P. Kellogg, Waterbury, Ct.

CHARITIES AND CORRECTION, Fifth New York City Conference of. Manhattan, Brooklyn and Lincolndale, Westchester County, May 19-21. Sec'y, John B. Prest, 287 Fourth Ave., New York.

CHARITIES AND CORRECTION, National Conference of. Forty-first Annual Meeting. Memphis, Tenn., May 8-15. Gen. Sec'y,

W. T. Cross, 315 Plymouth Court, Chicago.

CHARITIES AND CORRECTION, New Jersey Conference of. Asbury Park, N. J., April 19-21. Sec'y, Ernest D. Easton, 45 Clinton St., Newark, N. J.

CHILD-HELPING CONFERENCE, Lehigh Valley. Fifth Annual Meeting. Allentown, Pa., May 9. Sec'y, Mrs. Jere Schindel, 124 S. Fifth Street, Allentown, Pa.

CHILD, Third International Congress on the Welfare of the; Under auspices of National Congress of Mothers and Parent Teachers' Associations, Washington, D. C. April 22-27. Secretary Mrs. A. A. Birney, 806 Loan and Trust Bldg., Washington, D. C.

CITY PLANNING, National Conference on. Toronto, Can., May 25-27. Sec'y, Flavel Shurtleff, 19 Congress St., Boston, Mass.

FIRE PROTECTION ASSOCIATION, National. Chicago, Ill., May 5-7. Sec'y, Franklin H. Wentworth, 87 Milk St., Boston.

JEWISH CHARITIES, National Conference of. Memphis, Tenn., May 8-15. Sec'y, Louis H. Levin, 411 West Fayette St., Baltimore, Md.

KINDERGARTEN UNION, International, Springfield, Mass. April 20-24. Corresponding Sec'y, Miss Catharine R. Watkins, 1720 Oregon Ave., Washington, D. C.

LIBRARY ASSOCIATION, American. Washington, D. C. May 25-30. Sec'y, George B. Utley, 78 E. Washington St., Chicago.

NEWSPAPER CONFERENCE, National. Lawrence, Kan., May 11-14. Under auspices of the University of Kansas. Sec'y, Merle Thorpe, University of Kansas, Lawrence, Kan.

PUBLIC HEALTH NURSING, National Organization for. St. Louis, Mo., April 23-29. Held in connection with the American Nurses' Association and the National League for Nursing Education. Exec. Sec'y, Ella Phillips Crandall, 54 East 34th St., New York.

SOCIETIES FOR ORGANIZING CHARITY, American Association of. Memphis, Tenn., May 8. Gen. Sec'y, Francis H. McLean, 130 East 22d St., New York.

TUBERCULOSIS, National Association for the Study and Prevention of. Washington, D. C., May 7-9. Sec'y, Dr. Livingston Farrand, 105 East 22d St., New York.

WOMEN, International Council of. Rome, Italy, May 5-31. Sec'y, Alice Salomon, Neue Ausbacher Str. 7, Berlin W. 50, Germany.

WOMEN WORKERS, National League of. New York City. May 14-17. Sec'y, Miss Jean Hamilton, 35 E. 30th Street, New York.

TRIP TO THE MEMPHIS CONFERENCE

THE MONDAY Evening Club of Boston is this year following its usual custom of arranging its trip to the National Conference of Charities and Correction so as to include points of interest en route. Under the leadership of Parker B. Field, who had charge of the trip to Seattle last year, the club plans to leave Boston on May 3. The route will be through the Shenandoah Valley with stops at the Luray Caverns and the Natural Bridge. A day will be spent in and around Chattanooga with opportunity to visit Look-Out Mountain. Missionary Ridge and the battlefield of Chickamauga. The arrival at Memphis will be on May 8 just in time for the opening of the conference.

Returning, after the conference ends on May 15, Sunday will be spent at Asheville and then after a day at Old Point Comfort travel will be by boat to Boston, arriving May 21. Those with shorter time may return directly by an all rail route.

Registration must be accompanied by a \$5 fee and deposit should be made before May 1 with Mr. Field, 279 Tremont Street, Boston. It is expected that the total cost will be about \$110, not counting the expenses of the week in Memphis or the side trips while in Chattanooga or Asheville.

Other tours in connection with the conference providing a sea trip from New York to Savannah and thence by rail via Atlanta and Chattanooga, have been arranged by George E. Marsters who may be addressed in New York at 31 West 30th Street, and in Boston at 248 Washington street.

THE "THIRD MAN" IN INDUSTRIAL DISPUTES

[Continued from page 71.]

tration board' under the Hart, Schaffner & Marx agreement in Chicago and following the crisis in the clothing trades in New York last March, he was called also to the chairmanship of the committee on immediate action under the New York cloak and suit protocol. In New York and Chicago together he has 60,000 people under his jurisdiction. It was Mr. Williams who, in the Cherry Mine disaster without a court order or any other authority, induced the president of the Coal Mining Company to set aside a half million dollars for the dependents of the victims.

This "third man" told the commission that he was at one time a coal miner. Then he was interested in a theater, and after that was in business (insurance). Now, in his sixties, his occupation is that of mediator. "I used to be an arbitrator," said Mr. Williams, "and I can't help agreeing with practically everything that has been said here against arbitration. It is the old formal method to which I am opposed. The arbitrator sat as a sort of Supreme Court and rendered a decision in accordance with his own personal ideas of economics and justice. That is a mistake. Such arbitrations fail of their purpose because they do not get the moral support of the workers. I don't decide cases any more if I can help it. I get the two contending parties to come together and agree and make their own decisions. It is difficult for an outsider to arbitrate, but it is absolutely necessary that a mediator should be an outsider and free from the material interests which affect the contending parties.

"The mediator must first of all be a firm believer in unionism. He must help to build up the union in order to have such discipline as will secure the observance of an award. Then he ought to be continually on the job. The party he decides against today he may decide for tomorrow. Thus he has opportunity as time goes by to prove his fairness and to establish confidence.

"The reason why he should be an outsider is that he can put first the social interests. The two conflicting parties are too concerned with their contentions to remember any interests but their own. They must be checked. Someone should be there to say 'You can't be permitted in your passion to make ducks and drakes of the points at issue.' There must be built up a force that will conserve an agreement that has social value and say to the two parties 'You can't smash this agreement. The public has an interest.'

"This third man has an unparalleled opportunity for the exercise of ingenuity in finding the point where the interests of the two parties run parallel. I do not think that the interests of capital and labor are identical but at any given moment of time, there is a community of interest. It is the mediator's work to find this and bring the parties together on that basis.

"Thus it is possible to bring about without revolution some of the goals that

Four Helpful Volumes

THE HYGIENE OF THE CHILD

By LEWIS M. TERMAN, Ph.D.

This is the only book that takes advantage of recent important medical research in the development of children from six to adolescence that is available for use by parents. It follows admirably Dr. Holt's "The Care and Feeding of Children."

Illustrated with half-tone and line cuts.
\$1.75 net. Postage extra.

THE SOCIAL EMERGENCY

A Study of Sexual Hygiene and Morals

By WILLIAM T. FOSTER

Advised by Specialists

A frank, sympathetic, and wholesome treatment of the serious problem of training the youth of our land to think intelligently and act rightly in the complex social relations that confront them.

\$1.35 net. Postage extra.

THE HEALTH MASTER

By SAMUEL HOPKINS ADAMS

"Suggestions and advice on matters of health and hygiene are presented in a unique but effective way . . . The advice is sound . . . and the book should be well received by all who are looking for a work on the general subject of how to keep well."—Chicago Tribune.

\$1.35 net. Postage extra.

WHAT MEN LIVE BY

By DR. RICHARD C. CABOT

"A genuine contribution to the resources by which the souls and bodies of men are strengthened and sustained."—Cleveland Leader.

\$1.50 net. Postage extra.

HOUGHTON MIFFLIN COMPANY

The Transactions of the Fourth International Congress on School Hygiene

are now in press. They will be ready for distribution some time during the spring.

Each set consisting of five volumes will contain more than three hundred and fifty papers and over three hundred illustrations bearing upon many phases of school hygiene.

Subscriptions at Six Dollars each for the few remaining sets may be addressed to

HELP WANTED

WANTED—SUPERINTENDENT, for the Chicago Municipal Tuberculosis Sanitarium,

Situated in Chicago; now nearing completion, to be opened before the end of the year. Initial capacity 600 beds; ultimate capacity 900 beds. Largest municipal tuberculosis sanitarium in the country. Modern administrative and medical facilities. Excellent opportunity for a good medical man of right attainments, experience and executive ability. Salary \$5,000 per year and quarters and subsistence. Apply to President, Municipal Tuberculosis Sanitarium, 105 W. Monroe St., Chicago.

A SUPERINTENDENT for the Junior Republic, Annapolis Junction, Md. Apply National Junior Republic, 703 American Bldg., Baltimore, Md.

WANTED—A man or woman with institutional experience as superintendent for Colored Orphan Asylum, Riverdale-on-Hudson, New York.

SECRETARY (woman) for organization doing general community work in a small town. Address Social Service League, Grinnell, Ia.

Superintendent

Municipal Sanatorium

Otisville, N. Y.

\$3,000 a Year

Applications for examination for this position will be received by the
MUNICIPAL CIVIL SERVICE COMMISSION
until 4 p. m. Thursday, April 23rd.

Superintendent of the Tuberculosis Sanatorium is in general charge of the property interests, grounds, buildings, construction and repairs. He has supervision over farm, garden, dairy, stables, etc., also water supply, roads and sewage system. Candidates should have administrative experience in building construction or in the case of large estates, or in large institutions. Hospital or institutional experience while desirable is not essential. The examination will be thorough; those without requisite experience should not apply.

Age 21 to 50.

Maintenance in addition to salary.

Application Blanks to be had at Application Bureau, Room 1, 417, Municipal Building, Manhattan, or sent by mail on receipt of stamps.

MUNICIPAL CIVIL SERVICE COMMISSION

SITUATIONS WANTED

YOUNG RABBI with experience in Social Work desires congenial work for Summer months. Address I. S., 363 W. 122nd St., N. Y. City.

SOCIAL WORKER of experience and ability would like to make engagement for Summer work. Address Lela M. Hall, 408 Manhattan Avenue, City.

THE NEW YORK CHRISTIAN HOME for Intemperate Men—"Chester Crest" Mount Vernon, has accommodations for rich and poor men. More than ten thousand have been welcomed. Tel. 248. George S. Averv, Mgr.

FURNISHED APARTMENT

RENT, FURNISHED—Month, season, April 21, September 21. Complete house-keeping except linen. Sunny, airy, apartment, 6 rooms. Terms moderate immediate tenant. Address 1248 SURVEY.

the Socialists have in view. Through a series of forward steps the thing can be accomplished. The employer must be shown that he has increased efficiency when he prevents strikes. He ought to be willing to pay for that with higher wages.

"On the other hand, the workmen must be taught that when they get more wages they are preventing some other group of workmen from getting more. When the American Federation of Labor comes into its own and a union getting high wages prepares to strike for more, it will say to that union, 'Stop, you can't hog it all; you're getting more than your share now.' I hope to see unions become strong so that they may restrain themselves against getting more than their share. This will lead to the I. W. W. goal of looking out for the interests of all classes of labor. It is the strong union that is both effective and conservative. It is the weak union or the union

just organized that wants to fight. Whether in unions or in churches the power that fuses men together is the opportunity or necessity of fighting. That is why the I. W. W. is so turbulent. A sense of futility has determined their course. Give them means of expression and strength and they will grow conservative.

"It ought not to be difficult to get men to do this work. If the possibilities of it became known, men would leave their other business or occupations in order to do it. The money reward would be as nothing. As for myself, I know of no position greater in dignity or in the kind of reward that is worth while than the position I occupy. There is a chasm here between capital and labor that must be bridged. Only men with great social vision can help to bridge that chasm. But the men can be secured. There never was so much social spirit in the world as there is today."

INFORMATION DESK

The following national bodies will gladly and freely supply information and advise reading on the subjects named by each and on related subjects. Members are kept closely in touch with the work which each organization is doing, but memberships not required of those seeking information. Correspondence is invited. *Always enclose postage for reply.*

Children

CHILD LABOR—National Child Labor Committee, 105 East 22d St., New York. Owen R. Lovejoy, Sec'y. 25 State Branches. Where does your state stand? How can you help? List of pamphlets and reports free. Membership fee nominal.

CHILD HELPING—Department of Child-Helping, Russell Sage Foundation, 130 East 22d St., New York. Correspondence, printed matter and counsel relative to institutions for children, child placing, infant mortality care of crippled children, Juvenile Courts, etc.

CHILD WELFARE EXHIBITS—National Child Welfare Exhibition Committee, 200 Fifth Ave., New York. Charles E. Powlson, Gen. Sec'y, Anna Louise Strong, Director of Exhibits. Bulletins covering Results, Organization, Cost, Construction, etc., of Child Welfare Exhibits. Will assist cities in organization and direction. Exhibit material to loan.

CONSERVATION OF INFANT LIFE—American Assoc. for Study and Prevention of Infant Mortality, 1211 Cathedral St., Baltimore. Gertrude B. Knapp, Exec. Sec'y. Literature on request. Traveling Exhibit. Urges prenatal instruction; adequate obstetrical care; birth registration; maternal nursing; infant welfare consultations.

Health

SCHOOL HYGIENE—American School Hygiene Association. Pres., Dr. Henry M. Bracken, Chairman State Board of Health, St. Paul, Minn. Sec'y., Thomas A. Storey, M.D., College of the City of New York, New York. Yearly congresses and proceedings.

MENTAL HYGIENE—National Committee for Mental Hygiene, 50 Union Square, New York City. Clifford W. Beers, Sec'y. Write for pamphlets on mental hygiene, prevention of insanity, care of insane, social service in mental hygiene, State Societies for Mental Hygiene.

PUBLIC HEALTH—American Public Health Association. Pres., Wm. C. Woodward, Washington; Sec'y, S. M. Gunn, Boston. Founded for the purpose of advancing the cause of public health and prevention of disease. Five sections: Laboratory, Vital Statistics, Municipal Health Officers, Sanitary Engineering and Sociological. Official organ American Journal of Public Health, \$3.00 a year, published monthly. 8 months' subscription, 50 cents. Address 755 Boylston St., Boston, Mass.

NATIONAL HEALTH—Committee of One Hundred on National Health. E. F. Robbins, Exec. Sec., Room 51, 105 East 22d St., New York. To unite all government health agencies into a National Department of Health to inform the people how to prevent disease.

TUBERCULOSIS—National Association for the Study and Prevention of Tuberculosis, 105 East 22d St., New York. Livingston Farrand, M.D., Exec. Sec'y. Reports, pamphlets, etc., sent upon request. Annual transactions and other publications free to members.

SOCIAL HYGIENE—The American Social Hygiene Association (Inc.), 105 W. 40th St., New York. Division Offices: Chicago, 1632 McCormick Building; San Francisco, Examiner Building. Full information on request. Individual and society membership. The Association is organized to promote sound sex education, the reduction of venereal diseases and the suppression of commercialized vice. Executives, James B. Reynolds, Counsel: William F. Snow, M.D., General Secretary.

SEX HYGIENE—Society of Sanitary and Moral Prophylaxis, Tilden Bldg., 105 W. 40th St., New York. H. P. DeForest, Sec'y. 22 affiliated societies. Report and leaflets free. Educational pamphlets, 10c each. *Journal of Social Diseases*, \$1 per year. Membership, annual dues \$2, includes all literature.

NATIONAL ORGANIZATION FOR PUBLIC HEALTH NURSING—Object: to stimulate the extension of public health nursing; to develop standards of technique; to maintain a central bureau of information. Publications: Pub. Health Nursing Quarterly, \$1.00 per year, and bulletins. Address Ella Phillips Crandall, R. N. Exec. Sec., 54 East 34th St., New York City.

LIFE EXTENSION INSTITUTE, Inc., E. E. Rittenhouse, Pres. Gives life extension service to subscribers. Service No. 1 \$3.00 a year; Service No. 2 \$5.00 a year. Consists of periodic health examinations, inspection service, and health bulletins on disease prevention. Head office 25 West 45th St., New York City. Phone—Bryant 1997—1998.

CANCER—American Society for the Control of Cancer, 289 Fourth Ave., New York City. Curtis E. Lakeman, Exec. Sec'y. To disseminate knowledge concerning symptoms, diagnosis, treatment and prevention. Publications free on request. Annual membership dues \$5.

A MODEL HOUSING LAW

A New Book by LAWRENCE VEILLER

HERMAN M. BIGGS, M.D.
Commissioner, New York State De-
partment of Health.

"The method of presenting the vari-
ous general and sub-divided classifica-
tions of the law is not only clear and
lucid, but the notes and suggestions
scattered throughout the book add
greatly to a full understanding of the
book and their applicability."

H. M. BRACKEN, M.D.
Secretary, Minnesota State Board
of Health.

"I am sure that it will be very useful
to those interested in finding laws to
convert housing problems for the larger
cities or even the smaller municipali-
ties."

J. N. HURTY, M.D.
Secretary, Indiana State Board of
Health.

"I very much like Mr. Veiller's short
essay chapter upon Housing Reform
Through Legislation, and his remarks
upon building codes, tenement house
laws and housing laws are excellent."

**Are you interested in head-
ing off the slums?**

**Do you want to know how
to protect residence dis-
tricts from the invasion of
factories and other com-
mercial buildings?**

**Do you want a standard by
which you can measure hous-
ing conditions in your town?**

**Do you want a statement of
what good housing conditions
are?**

**A Model Housing Law will
meet your need.**

ELMER S. FORBES
Chairman, Housing Committee,
Massachusetts Civic League.

"I want to congratulate you on a fine
piece of work in 'A Model Housing
Law.' The diagrams make it particu-
larly valuable as now it is possible for
even the layman to understand what can
be done under the law. . . . This book
will become in the future the standard
of all housing regulations."

CHARLES J. HASTINGS
Medical Officer of Health, Depart-
ment of Public Health, Toronto.

"'A Model Housing Law' should, in
my judgment be in the hands of every-
one interested in improving housing
conditions in his city."

Real Estate Record and Guide

"Seven different treatments of plots
are offered for consideration, when the
purpose is to build a detached house,
and the examples given ought to be of
the utmost benefit in the improvement
of real estate in the smaller cities."

12mo, 352 pages, 80 diagrams. Price postpaid, \$2.00

NEW YORK

The GIST of IT—

THE four gunmen, whose lives in the public schools and on the public streets of New York were described in THE SURVEY of April 4, were electrocuted at Sing Sing on April 13. Some burning sidelights on the social results of capital punishment are given by John Collier, page 88, and Harry L. Hopkins, page 89. There seems to be a growing feeling that the ancient law of a life for a life has not been repealed. Rosenthal's life took not one, but four. How many lives will the four require in satisfaction of the law?

EFFICIENCY engineers and labor men seem to have adopted a policy of watchful waiting. Neither fully understands nor trusts the other. A review of last week's hearing before the Industrial Relations Commission, by John A. Fitch. Page 92.

NEXT week, the special Red Cross issue of THE SURVEY—emergency relief and rehabilitation following earthquake, fire, flood, tornado, shipwreck.

WHATEVER their motives or methods, the march of the unemployed on the New York churches made the whole country sit up and take notice of unemployment, writes John Haynes Holmes. Are not churches the first places for those in need to turn to? Page 94.

TO organize the forces of good for action—not for principles or resolutions—is the object of the Religious Citizenship League. Dr. Rauschenbush is president. Page 96.

CANADA'S first social service congress boxed the compass of social and civic advance, drew up a program, and called upon the government for various forms of social legislation. Page 95.

REVIEWS of recent books, including Dr. Crother's latest lectures and the South End House study of the city Negro. Page 98.

IF all the newspapers would follow the lead of the better ones, old Dr. So-and-so would soon pass into fakes' limbo. Venereal quacks, Samuel Hopkins Adams shows, cannot live without printers' ink. Page 90.

OF the 2,800 bills introduced in the last New York Legislature, about 100 may be classed as social. The fate of the more important of these. Page 88.

CINCINNATI has started to pay widows' pensions under the new Ohio law. An advisory committee representing private charities and additional probation officers will have charge, under the juvenile Court judge. Funds are so limited that only the most pressing cases can be relieved at once. Page 89.

THE Kern-McGillicuddy bill, providing compensation for every civilian employee of the federal government for accident or occupational disease, was reported favorably by the House judiciary committee on April 21.

THE SURVEY

COMMON WELFARE

AMENDING THE MARYLAND CHILD LABOR LAW

PASSED BY a Democratic Legislature and signed by a Republican governor, after having been urged by a newspaper owned by a prominent Progressive, a new amendment to the child labor law in Maryland reduces the age limit for newsboys from 12 to 10.

The Legislature two years ago established the 14 year age limit for most occupations in which children are employed, though, in order to get the bill passed, the age limit was made 12 years for canneries, mercantile establishments, places of amusement, and for newsboys.

The Baltimore *News*, a Munsey newspaper, has been in prolonged controversy with the officials of the Bureau of Statistics, who enforce the child labor law. Before the Maryland Child Labor Committee had completed its plans for the amendment of the law in the right direction, the management of the *News* got a bill introduced in the Legislature lowering the age limit for newsboys from 12 to 10. No effective protest was made against this measure until it had passed the Legislature, and then an ineffective effort was made to induce Governor Goldsborough to veto the measure. Since child labor reform is one of the prominent and popular planks of the Progressive Party platform, it is expected that Frank A. Munsey, who was given sufficient knowledge of the matter, will be criticised as inconsistent by child labor reformers.

Following this successful attack upon the child labor law, the owners of canneries in the country came to the Legislature with the plea that they ought to be allowed to employ children as young as 10 years of age. They made the usual claim that they did not want such children in the canneries, but that unless permitted to employ them, they could not get from Baltimore the families they need in this work during the canning season. They also claimed that it was a great blessing to the children to be taken to the country from the heated city pavements.

There was earnest but ineffective protest against this measure to allow 10

year old children to be employed for unlimited hours in the canneries. At a meeting of the Civic Club addresses were made by the secretary for the southern states of the National Child Labor Committee, and by a Baltimore canner who protested against the favoritism of the law. A Sunday mass meeting held in a theater was addressed by the same speakers and Congressman David Lewis of Maryland.

The bill was then pending in the Senate, having passed the House. A public hearing was arranged in the Senate chamber for a Tuesday afternoon, but on Monday night the bill was put upon the third reading, and, despite the protest of certain senators, it passed. Governor Goldsborough listened to earnest pleas against the bill and vetoed it, the House failing to pass it over his veto.

Later the amendments to the law, endorsed by the Maryland Child Labor Committee, restoring the 12-year age limit for newsboys, were favorably reported by the House committee, but, through an apparent combination between the Baltimore *News* and the Democratic city machine of Baltimore, the bill was indefinitely postponed.

AMELIA SEARS
Director Cook County Bureau of Public Welfare.

CITY AND COUNTY WELFARE BUREAUS AT CHICAGO

PUBLIC WELFARE DEPARTMENTS have been established simultaneously by the city of Chicago and the county of Cook. The ordinance introduced by Prof. Charles E. Merriam, as reported in THE SURVEY for March 14, was passed by the City Council, with an appropriation of over \$30,000. It provides for two bureaus; one to operate municipal lodging houses for men and women and to collect information on working conditions and the relief of unemployment; the other, a bureau of social surveys, to investigate living conditions, facilities for recreation, causes of vagrancy, crime and poverty, as the basis for ordinances or statutes to improve such conditions.

A group of representative and influential citizens presented to Mayor Harrison the names of several persons capable of serving as commissioner of the department, who were recommended for appointment by those interested in its establishment.

The county commissioners anticipated the City Council by appropriating \$10,000 for the maintenance of a bureau of public welfare. Leading the way to this action were several demonstrations of the value and practicability of such work as the bureau is intended to do. The Illinois Training School for Nurses had successfully co-operated with the county hospital in the after-care of convalescents following their discharge. The Society for Mental Hygiene had supplemented the work of the county court and of the detention hospital most effectively. Social workers had been added to the staff of the court as official investigators for the judges with the co-operation of the Bureau of Personal Service.

The Juvenile Protective Association had kept a trained worker among boys over juvenile court age incarcerated in the jail awaiting trial, which led to the appointment of this worker as assistant in the newly established boys' court. A worker with the women and girls in the county jail was also maintained by the Juvenile Protective Association.

This service has proven so successful

as to prompt the establishment of a distinct bureau of public welfare in the county administration. Amelia Sears was appointed director of the bureau. After gaining valuable experience in the Chicago public schools, she served the United Charities for ten years as superintendent of two districts and director of summer outing work. The varied case work she handled made her handbook, *The Charity Visitor*, a valued text for training visitors. For a year past, Miss Sears has served the Woman's City Club as its first secretary, which position she resigned to become director of the new bureau.

Under Miss Sears' direction, trained assistants will be provided to do personal work with inmates of public institutions and their dependent households. Two such assistants will be assigned to the county infirmary at Oak Forest to work among the patients in the tuberculosis hospital and their families, as well as among the aged poor sheltered at the infirmary. Personal work for prisoners in the county jail and their dependents will also be undertaken, thus taking over the voluntary work done there by the Juvenile Protective Association.

An inquiry into the home conditions of children cared for in institutions to which they are committed by the county, and from which they are subsequently released, is to be another function of the new bureau. Interest in the commitment of children to these institutions is emphasized by the fact of the increasing drain upon the county resources in paying for their care. Formerly \$70,000 was appropriated annually for this purpose, but during the fiscal year ending December 1, 1913, the care of children in institutions cost the county \$300,000.

The after-care of these children which the bureau may exercise, it is hoped, will result in the permanent re-establishment of family homes and check the in-and-out drift which now increases, at least in the number of cases reported as paid for by the county. The bureau adds a staff of thirteen new employees to the social service of Cook county.

SOCIAL LEGISLATION IN NEW YORK

OF THE 2,825 bills introduced into the New York State Legislature this year, approximately 100 may be classed as social legislation. A few are still in the hands of the governor but, unless indicated, all reported here have received his signature.

Of the labor laws the most far-reaching is the re-enactment of the workmen's compensation law, already reviewed in *THE SURVEY*. Another important labor measure, which the governor signed last week is the Patton bill creating a bureau of employment in the state De-

partment of Labor and providing for vocational guidance, following the English system of school and labor exchange co-operation. Special committees composed of employers, workmen, and persons experienced in the training of children are to be connected with each exchange to give advice about the management of the employment office and to assist boys and girls leaving school

THE SURVIVAL OF BARBARISM

By JOHN COLLIER

During the past week, while the drama of the four New York gunmen has been moving to its hideous conclusion, I have been among various kinds of people—among public officials, teachers, lawyers and workmen—and have been thrown with an almost equal variety of women. Till last week I had kept the entire subject out of mind, as being one where I could effect nothing and whose influence on my own thoughts could only be morbid.

The past week has shattered my common sense intention because I have found that apparently the greater part of humanity in New York city is in the grip of an emotional horror. Our Easter time has been invaded by a nightmare. We are able to realize that capital punishment matters little as it affects a few murderers each year, but that it matters greatly, inasmuch as it pollutes the imagination, fans the hysteria and shakes the faith in organized society among millions of people.

We care little for life in America, with our twelve thousand annual homicides and our hundreds of thousands of deaths from preventable diseases and industrial accidents. Whether the gunmen died or stayed on for a living death in Sing Sing need not have concerned the public at large.

But what ought to concern us Americans is the survival of barbarism, of savage emotionalism, of the blood-theory of law, and of the black, hideous superstition, which is infinitely more pervasive in its influence today, when everybody reads, than it was in England when they hung corpses by the roadside.

And ought we not to be concerned when organized society maintains a practice which makes organized society hideous, fiendish, as we see it moving, as the main agent in the nightmare of the past week? For the chief actor in this horror of the gunmen is society which produced the gunmen and which now expiates its own crime by inflicting upon humanity this spectacle of organized blood-thirst and primitive revenge which we call capital punishment.

between 14 and 18 with respect to choice of occupation and the securing of suitable positions.

Those interested in labor conditions in New York were much relieved when the governor signed the bill appropriating \$50,000 for the continuance of the New York State Factory Investigating Commission. The opposition in the assembly led many to fear that after a year's work the data collected by the commission on wages, hours and sanitary conditions might never be brought before the public.

The most radical change in the labor law this year is the measure reducing from 9 to 8 and from 54 to 48 hours the daily and weekly employment of children under 16 years of age in mercantile establishments, including offices, messenger service, theaters, hotels, etc., and limiting to 9 hours per day and 54 hours per week the employment of women over 16 years old in such establishments. The bill makes 6 p. m. instead of 7 p. m. closing time for children, and provides one hour instead of 45 minutes as the lunch period. Mercantile employes are further protected by a law backed by the Retail Clerks' Union and other organizations, prohibiting mercantile establishments from compelling employes to contribute to a benefit or insurance fund.

A much criticised amendment to the labor law is the newspaper carriers' bill permitting the employment of boys 12 years of age and upward from 3 p. m. to 6.30 p. m., and boys 14 years of age and upwards from 5.30 a. m. to 8 a. m. on prescribed routes if they have newsboy badges. This bill was enacted this year after four years' struggle, despite active opposition and request for a hearing from social workers and organizations.

Two other amendments weaken the one day's rest in seven law by exempting cheese factories, dairies, creameries, milk condenseries, milk shipping stations, butter factories, ice cream manufacturing stands, and milk peddling plants; and also, when warranted in the discretion of the commissioner of labor, employes engaged in any continuous industrial or manufacturing process in which the regular day's work is not more than eight hours. These bills have not yet been approved by Governor Glynn and he is being urged vigorously to withhold his signature.

Minor changes were made in the labor law dealing with ventilation and sanitation of mercantile establishments. The standard of the mercantile law was raised to conform to that covering factories.

Some drastic changes were made in the prison laws. An entering wedge for making prisoners more useful to the community is provided in two laws. One authorizes the construction of state and county highways by counties and

towns, as contractors, with convict labor. The other, already signed by the governor, appropriates \$25,000 for a brick making plant at Elmira Reformatory and for the acquisition of agricultural land. It is believed the experiment of making vitrified brick in Elmira will lead to the manufacturing of brick for state highways in all the state prisons.

More rapid improvement in county jails is sought in a bill not yet signed giving the State Prison Commission power to close unsanitary jails and those which are inadequate to provide for the separation and classification of prisoners.

Changes in the public health law cover a wide range. Following similar legislation in other states, a "red light injunction law," urged by the Committee of Fourteen in New York city, provides for abatement of houses of prostitution as public nuisances through the issuance of a permanent injunction on complaint of any taxpayer or organization for the suppression of vice.

The bill appropriating \$25,000 for the creation of a division of rural hygiene and authorizing the commissioner of health to employ rural sanitary agents with duties prescribed by the Public Health Council, is said to be the first of its kind ever passed. It has yet to receive the governor's signature. It was backed by the state grange which offered startling statistics as to high rural death rates.

Health measures successfully advocated by the State Charities Aid Association include a law permitting boards of supervisors to submit to voters the question of building county tuberculosis hospitals and employing field tuberculosis nurses, and one permitting any nurse, employer, teacher, head of family, landlord or other person to report cases of tuberculosis.

Among the bills relating to foods and drugs, one which has had wide publicity is the Boylan bill. This forbids a druggist to fill prescriptions containing opium, morphia, coca leaves, cocaine, eucaïne, chloral, canabia or other derivatives or preparations except upon written notice of a physician. It also provides for the treatment of persons addicted to the use of habit-forming drugs. This bill, signed by the governor April 17, goes further than any existing law in preventing the illegal sale of drugs.

Two much-needed laws in relation to the feeble-minded were passed. One permits any court of record, on application of a parent, guardian, friend, relative, poor law official, probation or parole officer, or superintendent of schools, to commit a feeble-minded person to an institution if after a hearing the judge is convinced that it is for the best interests of the individual and the community.

The other makes it possible to retain the feeble-minded in custodial care de-

spite the demands of relatives. If he decides that it is for the best interests of a patient, the superintendent of the institution may apply to a court of record for a hearing and the court may commit the patient to the institution until discharged by the board of managers. These two bills are fortified by a third appropriating \$5,000 for a commission of five to inquire into the subject of

CAPITAL PUNISHMENT AND BOYS

By HARRY L. HOPKINS

"I move that the whole club stand for two minutes in honor of the four gunmen who died today."

The scene was the meeting of a club of small boys in a settlement on the Lower East Side of New York on the evening of the day that society had taken its revenge on four gunmen for the murder of a fellow criminal. It was a slip of a boy, scarcely fifteen, who spoke, learned in all the vices of city streets, the recognized leader of his gang, yet highly responsible in that at this early age he is the main support of a large family. Tonight there was no sign of his usual rollicking deviltry.

"Aw, what 'yu talkin' about. Dago Frank went to the chair first."

"They had a hard time killin' Gyp"—this last from an underfed youngster whose widowed mother is trying desperately hard to keep him straight.

"They was all dressed in black, and they poured water over 'em to make the electricity work better."

"They sure died game," was one sentiment to which all agreed, for didn't every newspaper in New York announce that fact in glowing headlines? These and many other gruesome facts had fixed themselves firmly in their impressionable minds.

These boys were exceptionally keen, ambitious and clean-minded, a few of them wage earners, most of them in the public schools—a club formed by the union of two gangs from rival streets, now welded together with a fine club spirit. The basket-ball championship won the previous week, the club's annual play now only a few days off, the debate of the evening were all overshadowed tonight, for the gunmen had been electrocuted, and the details of their death must be firmly impressed on the minds of each one.

What is responsible for the fact that thirty-five boys, all under sixteen, should wish to rise to their feet to pay homage to four men whose crime their keen sense of right and wrong would naturally condemn under normal circumstances?

mental defectives and methods of their treatment in New York state.

Of the bills dealing exclusively with amendments to the New York city charter, two at least should be mentioned. One, drafted by the Height of Buildings Commission, provides that the Board of Estimate and Apportionment shall appoint a commission to recommend zones and regulations for the size of buildings, yards and open spaces and for restrictions as to industrial uses of buildings, in each zone, as is required in German cities. Although the bill has been signed by Mayor Mitchel, the mayor questions its constitutionality on the ground of confiscation of property rights. It is now being considered by the governor. Aside from a law authorizing the governor to appoint a commission to investigate housing in second class cities, this New York city bill is the one important piece of housing and city planning legislation.

The other important measure affecting New York city is one authorizing the Board of Education to establish a bureau of compulsory education, school census and child welfare and to appoint a director, an assistant director and other employees.

Measures which failed to pass include the bill granting allowances to widows with children; the Seeley bill regulating the practice of nursing; the bills authorizing the appointment of two women assistants in the children's court and the appointment by the police commissioner of twenty patrolwomen; the bill vetoed by the governor extending the parole privileges of convicts; the bill prohibiting the issuance of marriage licenses without a physician's certificate; the bill requiring a poison label for methyl alcohol in any form; several factory investigating commission bills relative to the enforcement of the labor laws; and certain bills simplifying court procedure in New York city.

WIDOWS' PENSIONS ADOPTED IN CINCINNATI

THE MOTHERS' pension act enacted by the 1913 session of the Ohio Legislature is to become effective at once in Cincinnati. Under the provisions of the law, a special tax levy, which cannot be assessed until 1915, must be made before funds are generally available throughout the state. In Hamilton county, however, comprised chiefly of Cincinnati, the county commissioners have recently appropriated about \$60,000 for pensions. Judge Frank Gorman of the Juvenile Court, under whose direction the pensions must be granted, announces the following plan which he hopes will assure efficient administration.

Additional probation officers are to be appointed for investigations and constructive social service with families securing allowances. These must be ap-

WHACK THE QUACK

Copyright, 1913, by John T. McCutcheon

The Immigrant—"At last! Safe in this glorious land of promise."

Where he soon becomes the prey of men who will promise anything.

Since the expose of quackery last fall by the *Chicago Tribune* the publishers of many foreign language newspapers have removed all quack advertisements from their columns.

Commenting editorially on this action, the *Tribune* said:

"The immigrant stands in greater need of enlightenment with regard to these medical pirates than the average American of the same social stratum, because of certain traditions which he has brought with him from the old world. The peasant from the Slav countries, for instance, trusts a physician fully as much as he does a priest. . . . When the immigrant reads in his weekly family paper, black on white, that Dr. So and So guarantees a cure, he takes it as gospel truth. Frequently he does not even realize that the statement he reads is a paid advertisement. He thinks it is an announcement made by the journal itself purely for the benefit of mankind. The quacks know the credulity of the great bulk of immigrant laborers. And they turn it to good advantage. However, the foreign paper cannot be severely blamed for accepting these advertisements when they are so readily accepted by a portion of the American newspapers."

pointed from civil service lists, but as an eligible list recently created includes a number of trained relief workers, excellent material is at hand. Private agencies have been asked to assist the investigators. A serviceable investigation and family record form has been prepared, which is really the Russell Sage Foundation's form modified for local needs.

Judge Gorman has appointed an advisory committee of five citizens who have had active connection with organized charities. Before this committee, the members of which have agreed to give as much time as necessary for thorough-going work, will be laid the results of each investigation; and from this committee will go definite recom-

mendations to the judge for the disposal of each case.

The Ohio law classes as eligible for pensions women whose husbands are dead, imprisoned, permanently disabled for work by reason of mental or physical infirmity, and deserted women when the desertion has extended over a period of three years. In addition to the usual requirements of morality, poverty, competency, and school attendance of children, the woman must have been a resident of the county for at least two years, and shall not perform labor outside of her home except with the consent of the court.

Allowances are limited to fifteen dollars a month for a woman with one child, and seven dollars a month each

for other children. Pensions may be reconsidered at any time and they must be reconsidered every six months.

More than 600 applications are already on file. The limited funds available cannot provide for more than one-third of the applicants. It is the plan of the court to have all applicants investigated before pensions are granted, and to make allotments to those in greatest need who will use the money to the best advantage.

This sudden influx of applicants to be investigated at one time has given the community its best test of how a confidential exchange saves labor and expense. About 40 per cent of the cases are on record in the exchange maintained by the council of social agencies.

VENEREAL QUACKS, THE LAW, AND THE NEWSPAPERS

THE ACTIVITIES of venereal quacks in practically all communities and of some communities against venereal quacks furnished forth the program for the April meeting of the Society for Social and Moral Prophylaxis in New York city.

Samuel Hopkins Adams was the chief speaker. His words have the convincing power of personal experience, for he has had many adventures in quackdom, recorded in his book, *The Great American Fraud*, and elsewhere.

Mr. Adams prophesied that of all charlatans the venereal quack will first become extinct. This is because he fights alone, and hence timidly. There is no organization behind him such as the patent medicine quacks possess, and he has no special support from the press, not being a national advertiser.

And finally, some of his practices bring him within reach of law—if the law can catch him. He goes through his victim's clothes, not for money only, but also for information. He learns who is the man's employer, what are his social connections, then, when the patient does not want to continue treatment, turns blackmailer.

Yet, in spite of it all, he operates all over the country, advertises in any paper that will take his money, makes his thousands of dollars, because it's nobody's business to oust him.

Thus far, the "ousting" has been done most successfully by individual newspapers in all parts of the country. Mr. Adams told of several great dailies that made it their business to turn publicity upon quacks. In every case there had resulted a decrease of quackery; in some cases the "doctor" had been put to rout entirely.

One dramatic story was that of the clean-up in Portland, Ore. The Social Hygiene Society of that city had been waiting to determine the best method of using the evidence they had accumulated against quacks there. Suddenly the op-

portunity came. A young man who had spent all he had on a certain "cure," and was in nowise better but always worse, entered the doctor's office, shot the doctor, the assistant and finally himself. This was too big a story to be suppressed even by papers that carried advertisements of this very quack.

Then the Social Hygiene Society called together some prominent citizens at a luncheon. The evidence was presented. The company resolved itself into a meeting which in personnel might almost have been a meeting of the Chamber of Commerce, organized a committee, and sent letters to every newspaper in the city, urging that they drop all ads of these fake "cures."

The Portland *Oregonian* had already weeded out its columns, and presently there remained in the entire state only one paper that failed to respond to the facts. The proprietor of that paper said he "wasn't in the business of safeguarding fools."

Not less vivid was the story of the more recent campaigns of the Chicago *Tribune*, reported in *THE SURVEY* for January 10.

"In New York," said Mr. Adams, "twenty years ago there was only one paper that refused ads of venereal cures [that was the *Evening Post*.] Today there is only one paper that will take them. That is the *Evening Telegram*."

Apparently it is in the press that greatest power over quackery is vested. A. C. Vandiver, counsel for the New York County Medical Society, had for his part in the program to answer the question, "What can be done with the venereal quack under the present law." He summarized his answer in two words: practically nothing.

There is at present in New York state no law against the advertising practi-

tioner who is a duly licensed and registered physician. A quack can be reached under the public health law if he practices under a name other than his own. But usually these quacks are really doctors, or in the instance of a corporation, the company employs doctors who use their own names in doing its work. The quack can be reached under the medical practice act and his license revoked for "fraud and deceit," or under the penal law for taking money under false pretenses.

The great need, Mr. Vandiver held, is for a stronger public health statute to define what shall constitute unprofessional conduct and to provide for the adequate enforcement of its terms.

PUBLIC SERVICE TRAINING AND THE UNIVERSITIES

WHAT SHOULD be the relation of the university to the state? Of the municipal university to the municipality? What is the nature of the public service now being rendered by the various types of universities? Should post-graduate students in universities be trained by doing things that need to be done, wherever the need is greatest? What should be the kind of service rendered by a national university? Why should a democracy have a trained public service? What can the university do for such training?

These are among the subjects on the program of the first national conference on universities and public service which has just been called by Mayor John Purroy Mitchel of New York city.

The committee on practical training for public service of the American Political Science Association is charged with the organization and management of the conference. This committee was created at the Boston (1912) meeting

of the association to examine places where laboratory work for graduate students in political science can be done; to recommend to faculties that graduate credit be given to such places; to use its best endeavors to obtain scholarships for this laboratory work, and to secure an endowment for building up a trained body of public servants, and to make, if possible, a system of records and efficiency standards for graduates doing practical work in political science.

The immediate purpose is to provide means for giving graduate students in political science opportunities for training by doing, under adequate supervision, things that need to be done by various governmental departments.

During its first year the committee made a study of present opportunities for practical training for public service. It showed in its report to the association, the wide range of opportunities, and extensive beginnings in utilizing them.

The committee began an investigation of agencies where practical training for public service may be had by post-graduate students. It has just about completed its investigation of bureaus of municipal research. It has been collecting information regarding legislative reference libraries and regarding one department of both state and national government. The material regarding bureaus of municipal research will be shortly submitted to the universities.

During the present year it is continuing its activities of the first year.

The following compose the committee: Charles McCarthy, chairman, Madison, Wis.; Albert Bushnell Hart, Harvard University; Benjamin F. Shambaugh, University of Iowa; William F. Willoughby, Princeton University, and Raymond G. Gettell, Trinity College.

HOW WILL THIS SIGHT INFLUENCE THE BOY?

INDUSTRY

MUTUAL MISUNDERSTANDING OF EFFICIENCY EXPERTS AND LABOR MEN—BY JOHN A. FITCH

ONE FACT of surpassing importance stood out at the hearings before the Industrial Relations Commission last week in Washington—the fact that efficiency engineers and labor men misunderstand and distrust each other.

To be sure the efficiency men started off blithely with the assertion that they were working first of all for the welfare of the employe and that they believed heartily in collective bargaining—a position they have never taken publicly before. Under cross-examination, however, matters took on a different aspect. It became clear that however excellent mathematicians they may be, or however dexterous with the slide rule, they are not economists.

In fact, before the end of the hearings one could hardly avoid the feeling that labor understands the efficiency experts better than the experts understand labor. Which is unfortunate, considering everything, for what labor does understand about efficiency only increases its distrust, but what each doesn't understand about the other is just what each needs most of all to know.

Frederick W. Taylor, Harrington Emerson, H. L. Gantt, Carl G. Barth and other efficiency engineers appeared and explained their methods. Officers of the American Federation of Labor and of unions affiliated with it presented an unbroken line of opposition to the movement, and two interested onlookers or non-combatants appeared in the persons of Robert G. Valentine, formerly Indian commissioner, who has hung out his shingle in Boston as an "industrial counsellor," and Louis D. Brandeis.

Frederick W. Taylor opened the discussion for the efficiency men, and to his statement of the case nothing material was added by the others, except as one detail or another was emphasized the more, and as each revealed his personal attitude toward industrial relations.

Mr. Taylor laid down four principles as the basis of scientific management:

First, the reduction of rule-of-thumb knowledge to systems and scientific formulae.

Second, the scientific selection and development of every man in the shop, with the determination to make every man a better workman and a higher wage-earner.

Third, the bringing of scientific management and men together in a spirit of co-operation and friendliness, and

Fourth, an almost equal division of work between employer and employe.

He explained the fourth principle as involving such planning on the part of the employer, and furnishing such addi-

II

The second of a series of interpretations of the hearings before the Federal Industrial Relations Commission by a staff representative of The Survey.

tional men as will relieve the worker of some of the details for which he is ordinarily held responsible.

The development of these principles, Mr. Taylor told the commission, will result in friendliness and co-operation between employer and employe, and the workman will be immeasurably better off. It will end industrial strife, he declared, because it involves a complete change in working relationships. The old ground of contention has been the division of the surplus that remains after the overhead charges have been paid. "Scientific management has shown that it is possible, through co-operation, to make this surplus so large that there will be no occasion to quarrel over the division," said Mr. Taylor.

Mr. Garretson of the commission asked what guarantee there would be that the employer wouldn't cut the wage rate and try to keep most of this surplus as before.

"No guarantee," was the reply. "But if he did, the scheme would go to smash. Production would fall off, costs go up, and the employer would have to come back to the high rate to save himself. But there is no insurance against the darn fool."

"Hasn't the darn fool been most prevalent in the past?" asked Mr. Garretson.

Mr. Taylor thought not.

"Is justice usually maintained?" persisted the inquisitor.

"Yes," said Mr. Taylor with energy. "In 999 times out of a thousand justice is done. If it were not so this would be a horrible world to live in."

In spite of this the representatives of organized labor were frankly suspicious and hostile. The thing most apparent in the opposition was the most human sort of feeling in the world. There is some-

thing about being timed by a smart young man with a stop-watch that seems humiliating. The whole attitude that seems to say, "My good fellow, we don't blame you for not being efficient; you don't know any better, but now we are going to teach you," is exasperating in the extreme. To be sure, this may not be a fair statement of the way the thing is done—tactful men wouldn't do it that way, of course. It may be, too, that the idea is more intolerable to the labor leader who doesn't work under the system than it is to the employe who does work under it. The efficiency men declared that wherever the system has been installed the men like it. But it was evident from the testimony that somehow the system has roused the bitter antagonism of the labor leaders, and it is essentially a class antagonism.

"We object to being reduced to a scientific formula," said one of the labor men, N. I. Alifas, president of that branch of the Association of Machinists to which machinists in government employ belong. "We object to this investigation to see just how much work we can stand it to perform, and then being required to do that much. We don't know when they will begin to make tests to see just how much food we can get along with and then base wages on that."

"If a husband, on leaving home in the morning doled out to his wife just the amounts of salt and flour and sugar she could use during the day, instead of leaving it to her judgment she would think he was getting pretty close-fisted. In the same way we resent being asked to explain just what we did with the last fifteen seconds."

So it was with the other labor men. There was a temperamental hostility to the movement and in addition the frankly expressed belief that what it really means is a new form of speeding up. John F. Tobin of the Boot and Shoe Workers' Union and James Duncan of the Granite Cutters' Union both insisted that no form of scientific management could beat the kind of efficiency now being practiced by their members. To increase production beyond what it is would be more than the workers could endure.

Back of it all was a deeper motive, however, and that was the feeling that scientific management is hostile to unions. The efficiency men had blamed the unions for not studying their methods and trying to co-operate. But the labor men seemed to think there is another side to it.

"If the experts believe in collective bargaining as they claim," said A. J. Berres, of the Machinists' Union, "it is peculiar that they have never knocked at the door of labor conventions and asked for an opportunity to explain their system. If they are so solicitous for the

welfare of labor and they believe that scientific management is going to bring on the millennium, why don't they go out of their way to explain it? They never have gone before even a local body to my knowledge."

It was just at this point that the efficiency men were most unsatisfactory. For the first time they announced themselves as favoring organization and collective bargaining on the part of the workman. But it was apparent that they had not grown fully accustomed to their new clothes. Charles W. Mixter, a "time study man" from New Haven, believes in collective bargaining after the efficiency system has been installed, and has been running a few years—not when it is being installed.

The expert has his hands full convincing the foreman, he said. "If he had to convert the men, too, the thing would be impossible." Unions die out under scientific management, however, he declared. The advantages under that system are so much greater than the union can get that the men do not feel the need of a union. The unions are therefore jealous. "The efficiency man and the labor leader are like rival tradesmen, trying to dispose of the same kind of wares—shorter hours, higher wages, better conditions."

Carl G. Barth of Philadelphia would require the labor leaders to study scientific management a few years before he would give them a voice.

Robert G. Valentine and Louis D. Brandeis both spoke against this idea. "The first essential is democracy," said Mr. Valentine. "After that, though a close second, comes the best way of doing things. The individual workman should not only participate in the installation of scientific management, but he should do so as a part of a union. I believe in collective bargaining because I prefer confusion to catastrophe. There is no benevolent despot who can make the world as it should be at a stroke."

Mr. Brandeis stated that without organization, labor is not safe. "I wouldn't depend on the good will of the employer," he said. But, with organization, he declared that there is nothing in scientific management that does not accord with the interests of labor.

Mr. Brandeis and Mr. Valentine are not efficiency engineers, however, and we shall have to get our ideas as to just what scientific management means from the men who are installing it.

Scientific management, it becomes evident, must be examined from two points of view. As a scheme for efficient production the test must be that of the accountant, the engineer and the manager. So far it is a business proposition.

But the efficiency experts now tell us that it is also a scheme for harmonizing the differences between capital and labor. That makes it the concern of the social economist. Not all the philosophies together have been able so far to determine exactly what justice is. Neither have they found a way by which justice—if it could be found—might be enforced.

It may be, then, that the labor leaders are not so far astray when they ask the efficiency men to give them some assur-

ance that under their new scheme the rate of payment will not be cut. The earning of a bonus by accomplishing a definite piece of work in a given time looks to the labor man very much like the old piece rate which, as the engineers admitted, was cut every time the workers seemed to be making too much.

How can scientific management guard against that? The answer that the efficiency men gave, that to cut the rate would be unscientific, can hardly be considered sufficient. Mr. Taylor may be perfectly sure that only a fool would cut it and that most employers are not fools and that justice is done 999 times out of a thousand. But a brother expert stated in private conversation that while it was the act of an idiot to slash the rate, most employers are idiots.

If the second estimate should happen to be correct instead of the first, what assurance would the working man have? One of the engineers frankly stated on the stand: "Of course, a rate may be so fixed as to enable a man to earn too much."

Sanford E. Thompson of Newton Highlands, Mass., pointed out that those employers who have adopted scientific management are able to share the benefits derived from it with both consumers and employes in the form of lower prices and higher wages. This is for the simple reason that their costs are so much lower than their competitors, that they can undersell them and get a larger market.

Professor Commons, of the commission, wanted to know how the manufacturer would be able to continue to share the rewards accruing from this form of management when the science has become universal and all the plants in a given industry are operated scientifically. Having come to that point, the only way by which they could compete with each other through underselling would seem to be by cutting the bonus or the base rate of payment. In the last analysis, he inquired, can scientific management do anything but postpone the final contest that must come between capital and labor over base rate, bonus and task?

Mr. Thompson's reply was that there would be no contest, if by contest anything approaching war is meant. There will be a peaceful arrangement, he thought, although he had not given deep study to that side of the question.

But if this peaceful contest is to come, Professor Commons inquired, will there not be a necessity for the organization of the workers before the final contest? Is it not necessary to have fundamental principles in mind from the beginning?

"We haven't come to that yet," said Mr. Thompson: "we mustn't cross bridges before we get to them."

And that in essence was the answer made by Mr. Taylor and the others to a similar line of questions. It does not seem to be a satisfactory answer. It would probably be asking too much of the efficiency men to require them to be economists as well as engineers. But if they are coming forward with a proposal which they say will end a fundamental economic conflict, it is not too much to ask that they face the plain facts of

the situation so that their program, when it comes to the test, shall not fail.

In the absence of that, it is very difficult to see how labor can safely place its interests in their hands. As was pointed out at the beginning, the labor man in his refusal to do that has seemed to understand the experts a little better than the experts have understood him. The efficiency men seem to view the suspicion of the workers with a certain impatience as if it were due to stupidity.

What the labor men do not seem to understand about the efficiency men, however, is that there can be an efficiency which, properly regulated, can bring large benefits to them as well as to their employers. They cannot afford to remain in ignorance of this movement which on the side of practical economies in human effort, leaving problems of distribution out of account, does seem to be worthy of all respect and confidence.

All in all, it was a great week in Washington, and the outcome must inevitably be a better understanding on the part of the representatives of labor and the advocates of scientific management as well. But one further conclusion is inescapable. The problem is too big and too fundamental to be studied in public through the medium of cross examination on the witness-stand. It is certain, in the first place, that absolute frankness will not be possible under such circumstances and, in the second place, that the subject is too difficult for examination by that method. The testimony will not present the subject in its true perspective. The commission, however, has done a service in bringing the matter into the open and will undoubtedly pursue it further through the employment of competent experts.

INCREASE OF COAL MINE FATALITIES IN 1913

THERE WERE 2,785 men killed in the coal mines of the United States during 1913, according to a report issued by the United States Bureau of Mines.

This is an increase of 425 deaths over 1912 and gives a fatality rate of 3.82 in every thousand men employed as compared with 3.27 in 1912. In 1913 there were 6,000 more men employed and the increase in production was between 30,000,000 and 40,000,000 tons. Thus there was an increase of 18 per cent in fatal accidents, with an increase of only about 8 per cent in coal production.

Joseph A. Holmes, director of this bureau, is quoted as saying that little comfort is to be found in the suggestion that this increase may in part be accounted for by the occurrence during 1913 of four large mine explosions. While the total deaths from mine explosions was 213 greater in 1913 than in 1912, the number of explosions in which more than five were killed was only seven as compared with ten explosions in 1912.

The four biggest explosions of the year and the number of deaths at each were: April 23, Cincinnati mine, Finleyville, Pa., 96; October 22, Stag Canon mine No. 2, Dawson, N. M., 263; November 18, Acton mine No. 2, Acton, Ala., 24, and December 16, Vulcan mine, Newcastle, Colo., 37.

CHURCH and COMMUNITY

Edited by GRAHAM TAYLOR

TANNENBAUM IN THE LARGE—BY JOHN HAYNES HOLMES, CHURCH OF THE MESSIAH, NEW YORK CITY

JUST WHAT Tannenbaum intended to accomplish by his spectacular invasion of the churches of New York with the "army" of the unemployed, seems still to be doubtful after weeks of discussion. As to what he actually *did* accomplish, there is nothing doubtful whatsoever.

He placed stories of his activities day after day on the front pages of the newspapers—set every editor in the city jabbering in his sanctum like a magpie in his cage—had every minister, like every settler in the Indian massacre days, trembling at the fall of night lest his church be the next one selected for assault—and forced ninety millions of people in the United States to know that there is a question of the unemployed, and to ask what can be done about it.

Most people think Tannenbaum a criminal; the rest probably write him down a fool. But however this may be, he at least did more to start people thinking all at once and hard upon one very immediate and hard problem than anybody else of whom I know. If this be crime or folly, he may well be content to have men make the most of it!

As to the specific challenge which Tannenbaum hurled at the churches, I am very clear in my own mind. Thus, I believe that, however unworthy his motives or rash his methods, this boy did a right thing in bringing the helpless and hopeless to the churches' doors. Indeed, although several weeks have passed since these dramatic events took place, I have not yet recovered from my amazement that anybody should be ready to assert that the churches are not properly to be turned to by those who find or even think themselves in distress.

Are the poor and wretched to understand that the churches are not ready to hear their cries and serve their needs? Has it actually come to the point that men are to be taught that the churches are the last places to go to for help, and not the first? Must saloons, gambling dens, even gutters, all be tried, before appeal is made to churches? Or shall we give precedence only to the Municipal Lodging House and its overflow piers and ferry-boats? For myself, I answer No! to all of these specifications, and claim rightful primacy for the church of God in the work of ministering to the outcast and friendless among God's children.

And as Tannenbaum and his men did the right thing in appealing to the churches, so also I believe that St. George's, St. Mark's, St. Paul's, the Labor Temple, and the Church of the Messiah, as contrasted with St. Alphonsus's alone,

did the right thing in answering their request according to their wisdom and to the extent of their ability. I find my authority for this judgment first, in Christianity, as witness the words of its founder, "Give to him that asketh thee"; and second, in the fundamentals of modern scientific charity, as witness the words of its leading exponent, Edward T. Devine: "The only thing that we are warranted in taking for granted when a family asks for assistance is that they believe themselves to be in need of assistance. They may be right or wrong about the fact; they may have very imperfect notions as to where their assistance should come from, if they do require it; they may be totally unable to give any clear and consistent account of the reasons why they require it. If, however, they are not mistaken about the fact, and have come to an appropriate place to ask for it, it is fair and reasonable that nothing whatever should be taken for granted except the need which has been revealed by the application."

These men may have been as worthless as you please. I myself saw them at close range in my own church and found them only helpless. But the churches had no right to assume anything as true except the need for aid expressed by the application, nor act upon any other supposition as to the true facts involved. That these churches were wise in the kind of help they gave, is a fair question for argument. But that they were true to the best tradi-

tions and highest ideals in receiving the men and helping them as best they could at short notice, is, to my mind, beyond dispute.

And yet, as I happen to know on good authority, of two hundred ministers directly consulted on these two points, less than 10 per cent expressed the opinion here laid down!

So far as I have been able to gather, from the information at my disposal, the opposition to this startling movement is based upon two facts: first, that the men were organized and voiced their appeals through leaders; and second, that the call for help was not so much a request as a demand. I venture to say that no minister, either Catholic or Protestant, would refuse to hear the appeal of any single man who might come knocking at his church door, or to give such aid to such a person as might seem practicable and wise. But when not one man alone but two hundred men together did the knocking, and spoke not their desire but their right to be given assistance, the situation seemed suddenly to change.

Thus, one clergyman, asked what he would do if the "army" came to him, replied that he would treat "this hold-up like any other hold-up." The rector of All Saints, visited one night by the men, replied (according to the newspapers) that he would receive them if they came singly one by one, but not if they remained together under organized leadership. And the priests of St. Alphonsus's turned the men over to the police and charged them with rioting and disorder.

Now here, to my mind, is a strikingly impressive situation. What do we have here, after all, but the appearance, on another stage, of that same battle, which was inaugurated by the trade unions years ago, for the right to organize and to deal with employers on the basis not of charity requested but of justice demanded? When a minister is willing to deal with one man as an individual but not with two hundred men as an organization, and to listen to appeals for charitable relief in the single case but not to formulated demands for just conditions of life and labor for the general group, what is he doing but going through the same performance as the employer who refuses to recognize the union or to consider a formal program for new and better relations between himself and his men?

It is the same situation all over again on another plane of experience—and therefore the same larger problem of social justice calling for settlement! These church invasions constitute something more than a mere flash in the pan, a merely clever ruse of labor agitators, a merely sporadic outburst of desperate men. Involved in it, of course, are such

Phil Porter in Fargo, N. D. News

"MARTYR THE HAND RAISED TO PREACH A NEW GOSPEL AND A THOUSAND HANDS WILL TAKE ITS PLACE"

elements as love of excitement, aimless "follow-the-leader," the irrepressible gang-spirit, and so on. But what we have at bottom is only the newest extension of that great awakening of the people to self-consciousness which was long ago made manifest in higher and more restricted sections of the social field.

Down, down, to the very lowest and darkest levels, the light is penetrating; and here, among the most forlorn and outcast of mankind, the sense of injustice is being stirred and the power of united action being learned. And woe to the church or to any other social institution, if, in the face of this vague and brutal turmoil of the spirit which is ever generated by the sudden discovery of wrongs long endured and rights long denied, it takes refuge in any such hoary subterfuge as that of dealing with individuals as contrasted with organizations, or plants itself in the seat of the scornful by insisting upon requests for charity as contrasted with demands for justice!

What matters it whether one man asks for help alone, or a hundred men ask together? What matters it, if the request is spoken in the whining tone of the beggar, the wailing cadence of the sufferer, or the mad outcry of the rebel? The church is rightly concerned with nothing but need, and where need exists, the church must act. Like the God whom it pretends to worship, it must find what is sought of men, give what is asked by men, and open the portal when men knock!

But what church, or group of churches, is there which has the means, even if it has the will, to meet such a problem as is presented from this viewpoint? The men who organized the campaign of invasion numbered at most a few hundreds, and the churches which opened their doors, met the needs of this little group for but a few nights. Behind the "army" stand tens of thousands of unemployed equally deserving of aid, and equally entitled to an answer if they could organize and speak together their agony and protest.

It is thus that the churches are confronted here by a problem infinitely bigger than they can handle,—a problem so

big, indeed, that no institution short of society itself can hope to cope with it! The plight of the churches, when Tannenbaum's "army" came knocking at their gates, is typical not of their weakness, but of the weakness of all the ways and means we have today, in this twentieth century civilization of ours, for dealing with this stupendous wrong. All we are fitted to do at present is to give, through our churches, charity societies, and municipal agencies, such food to the hungry, clothing to the naked, and shelter to the homeless as we can, while hoping fervently for the return of "good times" and the resulting ebb of the tide of destitution.

In the matter of unemployment, as in the matter of sickness, old age, and until very recently industrial accidents, we have not yet advanced beyond the kindly sentiment of old-fashioned individualized charity to the reasoned efficiency of modern social science. Still are we giving doles, investigating cases, helping separate individuals and families, instead of stopping the evil at its source, which is nothing short of the industrial system itself, and of meanwhile establishing national agencies for the care of those who are the victims of the unjust social process.

Unemployment, like every other great social wrong, is a problem to be handled by society as it is a problem created by society. The churches, like every other private agency, are only swamped by the volume of its sweeping flood. But this very fact indicates the more clearly the duty of the churches to raise the cry of alarm and stir society to act. Here is the true work of the church which would truly serve our civilization in this hour of its need. This church must help the helpless, lift the fallen, save the lost, as always. But more than this today—it must speak the social message, and thus convict men of their sin; and initiate the work of social reconstruction, and thus show men the way of salvation.

This, as I see it, is the larger aspect of Tannenbaum's invasion,—a society sick unto death! This is the larger aspect of the church's response—the constructive ministry of healing!

pose was quite worthy of special notice. One of the leaders present stated that it reminded one of an old-time revival with the right kind of sinners present. No less noticeable and sometimes very interesting was the diversity of views expressed by those whose views shaded off from the merely palliative to the more radical methods of dealing with social ills.

The themes for discussion included: A Weekly Rest Day and National Well Being; The Canadian Indians and Their Relation to Canada; The Church and Industrial Life; Child Welfare; The Problems of the City; The Problem of the Country; Commercialized Vice and the White Slave Traffic; Immigration, Political Purity, Temperance; Gambling, and Crime and the Criminal.

For the consideration of these themes some of the most eminent men in Canada came together: the Duke of Connaught, Canada's governor general, Premier of Canada R. L. Borden; Sir Wilfred Laurier, liberal leader of the House of Commons; and the mayor of Ottawa all brought greetings and expressed themselves on the development of society from the humanitarian standpoint. Addresses were given by a number of members of the Canadian cabinet, city aldermen, professors in the universities, general superintendents of the Methodist church, bishops of the church of England, Socialists, labor men, slum workers, doctors, lawyers, farmers and others.

A statement of the attitude of the Social Service Council of Canada was expressed on the program as follows:

THE SOCIAL SERVICE COUNCIL BELIEVES

THAT RIGHTEOUSNESS CAN BE REALIZED IN THE COMPLEX CONDITIONS OF MODERN LIFE ONLY THROUGH THE APPLICATION TO ALL HUMAN AFFAIRS OF THE PRINCIPLES OF THE KINGDOM OF GOD.

DECLARES

FOR THE APPLICATION OF CHRISTIAN PRINCIPLES TO THE OPERATIONS OF INDUSTRIAL ASSOCIATIONS WHETHER OF LABOR OR OF CAPITAL.

FOR A MORE EQUITABLE DISTRIBUTION OF WEALTH.

FOR THE ABOLITION OF POVERTY.

FOR THE PROTECTION OF CHILDHOOD.

FOR THE SAFEGUARDING OF THE PHYSICAL AND MORAL HEALTH OF WOMEN IN INDUSTRIAL LIFE.

FOR THE ADEQUATE PROTECTION OF WORKING PEOPLE IN CASE OF INDUSTRIAL ACCIDENTS AND OCCUPATIONAL DISEASES.

FOR THE SUNDAY REST FOR EVERY WORKER.

FOR CONCILIATION AND ARBITRATION IN INDUSTRIAL DISPUTES.

FOR PROPER HOUSING.

FOR THE ADEQUATE CARE OF DEPENDENT AND DEFECTIVE PERSONS.

FOR THE RECLAMATION OF CRIMINALS.

FOR WHOLESOME RECREATION.

FOR THE PROTECTION OF SOCIETY AGAINST CONTAGIOUS DISEASES.

FOR INTERNATIONAL PEACE.

Two distinguished guests from the United States were among the speakers, adding fuel to the fire and helping by their inspiring messages to kindle the glow of a common brotherhood. Charles Stelzle, consulting sociologist of New York, spoke on Labor Problems, and Prof. Graham Taylor of the Chicago School of Civics and Philanthropy and THE SURVEY, dealt with the Problems of the City and Training for Social Service.

On such themes involving issues so vital, with representatives of every shade of opinion and almost every method of social betterment, the unanimity of spirit and the domination of the idea of the Kingdom of God was quite

THE FIRST SOCIAL SERVICE CONGRESS OF CANADA —BY HUGH DOBSON

THE FIRST congress of its kind to be held in Canada was most representative, including delegates from the federal Parliament, a number of the provincial parliaments, municipalities, the Trades and Labor Congress, the Dominion Grange and Farmers' Association, the Canadian Purity Association, the Church of England, Presbyterian, Congregational, Methodist and Baptist Churches, the Salvation Army and the Evangelical Association. The object of the congress was "to arouse interest and enlist all Canadians in behalf of social righteousness with the purpose of improving social, economic, and ethical conditions in Canada."

Representing such diverse elements as the delegates did in the national life of Canada, the unity of feeling and pur-

remarkable. This first social service congress in Canada marks a new epoch of more constructive society building than has hitherto prevailed.

The value of the congress was enhanced by the fact that the House of Commons was in session, in the same city at the same time, and by the fact that many of the subjects were under discussion in the Parliament of Canada coincidentally with their presentation at the congress.

Several resolutions were passed by the congress which were later presented to the dominion government calling upon Parliament:

To appoint a royal commission to investigate and make a report on the coal miners' strike on Vancouver Island;

To prevent the manufacture, importation, and sale of cigarettes in Canada;

To establish free employment bureaux;

To appoint a royal commission to investigate the unemployment problem;

To enact a policy that will raise the Indians to a level of citizenship;

A CHURCH ORGANIZATION TO WORK FOR SOCIAL AND INDUSTRIAL WELFARE

THE RELIGIOUS Citizenship League, "national, non-partisan, non-sectarian," is the latest advance of the churches in social reform. It is a distinct advance, too radical for some church people, but already winning the support of a surprising number of people of various schools of ecclesiastical and economic thought.

This is what the league aims at: To get the religious people to stand together for definite measures. The considerations at the basis of the league are stated as follows:

"1. A large share of our modern social problems cannot be worked out on a personal, parochial, denominational, or other sectarian basis. We are being forced to realize that we are all one.

"2. The forces which make for righteousness in the community are more in number and far mightier in power than the forces for evil. Only the forces for righteousness must act, and must act together.

"3. If we have bad laws, poor enforcement, corrupt legislation, it is largely by the consent of the forces for good through indifference, apathy or lack of unity.

"4. This united effort must be applied to concrete legislative measures. Legislation can by no means do all; yet legislation is the chief way by which the will of the whole community can be expressed. The churches of the land, through their Federal Council, and other bodies have united upon many important principles; but principles unapplied solve no problems. The question is, Can the various forces now unite for measures? To develop such concerted

To adopt a closer inspection of immigrants from southern Europe;

To create a department of child welfare, to give pensions to mothers;

To initiate an old-age pension scheme; and

To assist the extension of co-operative societies.

The congress also went on record as being in favor of woman suffrage, labor unions, total abstinence, and social survey work.

It seems manifest that the churches in Canada give social service its rightful place, and recognize that religion is concerned with all that is in life—industry, commerce, housing, sanitation, politics. One result of the congress is the decision of the Social Service Council of Canada to establish a bureau of surveys and exhibits similar to that of the Russell Sage Foundation.

The feeling prevailed at the close of the congress that though there was much diversity of opinion and a rich variety of methods backed by very strong convictions, that such a gathering was a promise of mighty changes that will be wrought out in Canada through its inspiration.

action is the aim of the Religious Citizenship League."

The league proposes to practise what it preaches by having its officers and its program of measures adopted each year by a referendum vote of the members of the league. This will make the league a vital thing, and bring its platform each year up to date. It is not necessary that every member accept each plank in the platform, provided that he or she is in sympathy with the objects of the league and is willing to work for those measures which the majority vote for.

The league will use *The Gospel of the Kingdom*, published by the American Institute of Social Service. This magazine will be devoted this year to a study of the measures adopted by the league, and as the lessons it publishes now have a circulation of 10,000, besides reaching 30,000 more as published in the *Homiletic Review*, it will give the league a large constituency.

The dues of the league are \$1 per year, and this will entitle each member to the magazine.

Responses to the efforts of the league have already come from all portions of the land and from all churches, and from some of no church.

The league, while adopting broad aims, has voted to concentrate its immediate efforts on the problem of unemployment, so that it is already doing a large educational work and getting down to immediate practical efforts.

It is enrolling church people interested in unemployment throughout New York state, and will then work in other states. The league believes that very little can be done by starting new employment bureaux but that a system of free employment bureaux through the state, with connections in every town,

would be effective. This connection can be made, the league states, through the churches. If every church in the state had an employment bureau connected with the state bureaux, then a great many of the unemployed could be placed in the country.

For the unemployable, the league advocates state farms or colonies, on an adequate scale. A New York industrial farm has been voted, but without sufficient appropriations. The league desires, therefore, a state-wide organization to work for a vote of sufficient appropriations. Those interested should send their names to the secretary, W. D. P. Bliss, 80 Bible House, New York.

RELIGIOUS VALUATION OF ALMSHOUSE WORKERS

OSCAR LEONARD, secretary of the Missouri State Conference of Charities and Correction, in these telling words to the Association of Infirmary Officials magnified their office by placing a distinctly religious value upon them:

"I wish to tell you that you are integral parts of the conference. I understand that some of you have an idea that you are of no importance as an organization and that your jobs are small, insignificant jobs. Let me assure you that the Association of Infirmary Officials is an important part of the conference. All instruments in a large orchestra are necessary. If any instrument be missing the music would be faulty. The same applies in social work.

"Now as to your own jobs. I know that you are hidden away in corners of the state where you seem to be forgotten. I know that your wives work hard to help care for the poor and decrepit. I know that you neither expect nor receive thanks. Gratitude in social service is a rare thing. I know that kicks are more frequent. I know that you are often heartsore and ready to give up. I am one of you and I know my problems. But our work is done not for gratitude nor is it done for money. There is precious little money in social service work for the social worker. We do it because we wish to serve and serve well.

"Yours is the most difficult job, too. You are handling the old, decrepit, feeble-minded. Some of them have had to come to you because of their early transgressions. Some seem bereft of the divine spark which is hidden somewhere in each human breast. They are a helpless, hopeless lot, for the most part, these poor old men and women you are handling. It takes a great deal of optimism, a great deal of deep love and quite a bit of superhuman effort, to serve them without becoming discouraged.

"Do not allow yourselves to despair. Do not allow anyone to tell you that your work is sordid and uninteresting. It is you who make the job. The job does not make you. As you serve these poor men and women remember that a Hebrew prophet of old, whom you worship, said: 'Inasmuch as ye have done it unto one of the least of these my brethren, ye have done it unto me.'

The Trend of Things

PROFESSOR ROSS discusses The Celtic Tide in the latest of his series on immigration in the *Century* (April). Meanwhile, the pro-immigrationists have a champion in Mary Antin who has begun a series in the *American Magazine* on They Who Knock at Our Gates. Her point of view is well illustrated by the April instalment, in which she compares the "new immigration" with the old, going back to the Pilgrim Fathers as the original immigrants:

The predominant virtue of the Pilgrims was idealism. The things of the spirit were more to them than the things of the flesh. May we say the like of our present immigrants? Of very many of them yes; a thousand times yes. Of the 8,213,000 foreigners landed between the years 1890 and 1900, 930,000 were of that race which for nineteen centuries has sacrificed its flesh in the service of the spirit. It takes a hundred times as much steadfastness and endurance for a Russian Jew of today to remain a Jew as it took for an English Protestant in the seventeenth century to defy the Established Church.

If it was a merit in 1620 to flee from religious persecution, and in 1776 to fight against political oppression, then many of the Russian refugees of today are a little ahead of the "Mayflower" troop, because they have in their own lifetime sustained the double ordeal of fight and flight, with all their attendant risks and shocks

* * *

MARY ANTIN compares the immigrant to the Pilgrim in his attitude toward civic affairs and education, his desire to build up a home, his virility, shown "by the fact that the great majority of them make good," and his value to the nation. "They supply the animal strength and primitive patience that are at the bottom of our civilization." She continues:

"In the whole catalog of sins with which the modern immigrant is charged, it is not easy to find one in which we Americans are not partners—we who can make and unmake our world by means of the ballot.

Oh, that the American people would learn where their enemies lurk! Not the immigrant is ruining our country, but the cheap politicians who try to make the immigrant the scapegoat for all the sins of untrammelled capitalism—these and their masters."

She concludes:

"From all this does it follow that we should let down the bars and dispense with the guard at Ellis Island? Only in so far as the policy of restriction is based on the theory that the present immigration is derived from the scum of humanity. But the immigrants may be desirable, and immigration undesirable. If statecraft bids us lock the gate, and our national code of ethics ratifies the order lock it we must, but we need not call names through the keyhole.

Mount guard in the name of the Re-

public, if the health of the Republic requires it, but let no such order be issued until her statesmen and philosophers and patriots have consulted together. Above all, let the voice of prejudice be stilled, let not self-interest chew the cud of envy in full sight of the nation, and let no syllable of willful defamation mar the oracles of state. For those who are excluded when our bars are down are exiles from Egypt, whose feet stumble in the desert of political and social slavery, whose hearts hunger for the bread of freedom. The ghost of the "Mayflower" pilots every immigrant ship, and Ellis Island is another name for Plymouth Rock."

* * *

THE New York World Almanac and Encyclopedia for 1912 gives a table showing the commonest surnames at the present time in England and Wales, Scotland and Ireland, arranged in the order of their frequency, according to a compilation made by the London *Pall Mall Gazette*, also the fifty commonest names in the cities of New York, Chicago, Philadelphia and Boston specially compiled for the World Almanac.

With this and Who's Who in America to work from, Frederick Adams Woods of the Massachusetts Institute of Technology has made a study of The Racial Origin of Successful Americans (published in the *Popular Science Monthly*). Admission to Who's Who depends either on "special prominence in creditable lines of effort," or on official position, civil, military, etc. Dr. Woods gives in detail statistics for the most frequent names in four cities. Granting that name is not always a correct indication of nationality and that some immigrants anglicize their names, he summarizes as follows:

In the four leading American cities, New York, Chicago, Philadelphia and Boston, it is safe to say that, at the present time, those of English and Scotch ancestry are distinctly in possession of the leading positions at least from the standpoint of being widely known, and that, in proportion to their number, the Anglo-Saxons are from 3 to 10 times as likely as are the other races to achieve positions of national distinction. The cities contain most of the foreign elements. The cities are also the concentration points for most types of ability. They are also the breeding grounds of future leaders. Therefore this study of the 4 cities ought to suffice to throw light on a number of important questions.

* * *

RAY STANNARD BAKER in Seeing America, this month, writes of The New Pioneering and Its Heroes (*American Magazine*). Despite the fact that there is a large stretch of wilderness in the Middle West that is just being developed, Mr. Baker refers not so much to these latter-day settlers as to the pioneers who are open-

ing a new era in farming, by conservation of the land.

This is the movement which is so interesting to the visitor in the West—though it is going on also in the South and East. Men of vision have looked upon this new wilderness and found it wonderful with promise. Seventy years ago the cry that thrilled Americans was "Westward, Ho!" It developed poetry, songs, a literature of its own. It had its own heroes: Daniel Boone, Davy Crockett and John C. Frémont. It attracted the flower of youth and captured the imagination of the whole land. Well, a new cry is now arising that is likely to be as persuasive as that older one. It, too, has a thrill in it; it, too, is developing its own songs—and its own heroes. It might be called, "Inward, Ho!" for that it rouses men to use the powers within them, or it might be called "Downward, Ho!" for that it asks men to look for the miracle of adventure, for the joys and hardships of pioneering, not to the West, nor the South, nor the North, but into the common soil on which they stand. One of its favorite cries, though it expresses only one phase of a vast movement, is "Back to the Land!"

* * *

THIS month sees the conclusion of the story of one of these western pioneers—a woman homesteader in Wyoming—in Letters of a Woman Homesteader (*Atlantic*). Left a widow with a two-year-old daughter and no means of support, she tried, first, working by the day, then went to Wyoming as housekeeper for a Scotch homesteader whom she afterward married. The letters were written to a former employer in Denver and reveal the frontier as a place of adventure where a wonderful spirit of brotherhood keeps life wholesome and happy in these far spaces.

Besides this story of an American pioneer, two notable autobiographies have been running in the magazines, the past winter—those of Abraham Mitrie Rihbany, just ended, in the *Atlantic*, and of S. S. McClure in *McClure's*. Whether it is the penniless Syrian immigrant from the shadow of Mt. Lebanon, or the Irish immigrant boy entering school in the third preparatory year with a determination to go through college and fifteen cents in his pockets, it is the same story of ideals and aspirations, of struggle and privation, and finally of success. Here are two of the "old immigration" who have "made good."

* * *

A TEACHER engaged in social settlement work was chatting at the settlement center one afternoon with a number of her small Polish and Hebrew charges, says *Harper's Magazine*. One youngster proudly announced:

"We gott new brudder to our house today!"

"You have!" exclaimed the teacher. "Where did you get him?"

"Oh, Dr. Goldberg fetched him," asserted the youth, with a knowing look on his face.

At this juncture a Polish lad (one of a family of ten) eagerly broke into the conversation: "Teacher!" he cried, "we take of him, too!"

BOOK REVIEWS

ROUND ABOUT A POUND A WEEK

By Mrs. Pember Reeves. The Macmillan Company. 231 pp. Price \$1.00; by mail of THE SURVEY \$1.10.

Family Budgets of English Working Men

This latest contribution to the study of the cost of living may be recommended quite as much for its apt phrases, its power of portraying the homely charm of these English workingmen's homes, as for its unpretentious but painstaking presentation of individual family bud-

gets.

A committee of the Fabian Women's Group in London has been studying the effect on both mother and child of sufficient nourishment during the periods immediately preceding and following the child's birth. The thirty-five families chosen for the experiment were visited for about three months before the birth of the child and until it was a year old. As part of the investigation the women were asked to keep a budget of expenditures and on these figures and the intimate knowledge gained by frequent visits this book is based.

To the American reader the standard of living seems more limited though not necessarily lower than that of workingmen here. These families whose expenditures are "round about a pound a week," we are repeatedly assured, are not the poorest people of the district. "They are respectable men in full work at a more or less top wage, young, with families still increasing, and they will be lucky if they are never worse off than they are now." "Dreadfully decent" is the phrase which characterizes their lives and their homes. Throughout the budgets are evidences of thrift and foresight; instead of our way of mortgaging the future by buying on the installment plan there are contributions of 6 d or 1 s to coal clubs, boot clubs, even to stocking clubs, to provide for these necessities which cannot possibly be bought out of any single week's income.

The food expenditures, too, indicate meager living. For breakfast and tea there is tea and bread spread with jam, though for the husband there is as "reluctant to his tea" a bit of bacon or fish. Is it peculiarly British, this careful provision of an extra for the man, in which the family does not presume to share? A joint for Sunday which lasts half the week and perhaps a mid-week stew of "a pound of pieces" is all the meat provided. That the situation cannot be remedied by instructing wives in household management is the theme of the chapters on Buying, Thrift, Mother's

Days. There is the illuminating incident of the mother who was advised to give her family cheap and nourishing porridge. But, alas, there is only an old kettle to which the porridge sticks and it is hard to keep stirring when there are a baby and an "ex-baby" to care for and there is neither milk nor sugar to make it palatable. "And my young man 'e says ef you gives me that stinkin' mess I'll throw it at yer."

The book can be surely recommended to all who are trying in model flats or cooking classes or house visiting to help women meet their problems. It is a word picture of the hopes with which the households are started, the ambitions which live on in spite of discouragements, the rigid economies, the dull monotony and loneliness which is the share in life of these women.

The conclusion is a sober one, that the children in these and thousands of other homes are undernourished because of inadequate income and not because of lack of skill in household management. The solutions proposed are the further extension of minimum wage laws or, if wages are still insufficient, the provision of adequate nourishment for the children of the state through public guardians whose chief concern is to be the well being of the children of the nation. There is much that is suggestive for us in the description of conditions in workingmen's homes, even though we are not willing to admit in this country so total a failure of our industrial system as is implied in this second proposal.

MARGARET F. BYINGTON.

THREE LORDS OF DESTINY

By Samuel McChord Crothers. Houghton Mifflin Co. 129 pp. Price \$1.00; by mail of THE SURVEY \$1.09.

The Fatalistic Doctrine

With each great advance in science come new or revised theories of existence. Old boundaries of knowledge and of action are thrown down or passed over. But new limits appear which are felt to be even more inevitable.

There are certain problems of human existence which continually recur. They seem new to those who propound them but they seem new only because they are newly expressed. Among them is the age-long conflict between free will and necessity.

Dr. Crothers' three lectures on Destiny face the fatalistic doctrine bravely. He states it as strongly as any of its professed adherents: "To the fatalist earth is a prison house and we are cap-

tives condemned to life imprisonment. Knowledge is only the knowledge of our bars . . . and walls. . . . We are acted upon but we do not truly act. We originate nothing; we change nothing."

"At some time or other, every one must face the fatalistic conception of life and hear the old refrain 'Vanity of vanities, all is vanity'! But it makes a great difference whether we recognize this as a kind of thought from which mankind has been slowly emerging or as the sad, inevitable conclusion toward which all severe thinking tends."

"Of course, man seems to be the helpless creature of circumstances which are beyond his own control. That seems evident enough at the first comprehensive glance at his environment. Every glimpse which we have of the working of the primitive mind reveals the mingling of fear and apathy. Above the passions of angry men and angry gods is the impassive Fate against which there is no contending."

But the writer continues: "The great significance of human history is that we have been slowly emerging from the fatalistic habit of mind. The doctrine of the futility of effort, once universal, has not prevented effort being made. And that portion of mankind which has made the most determined and conscious effort, has come to believe in itself and to claim the lordship of the earth. Out of the accumulations of human endeavors there has grown a great human faith which characterizes the progressive portion of the race."

Mr. Crothers tells us that this Faith, which is Courage, is one of the Three Lords of Destiny, the other two being Skill (or Efficiency) and Love. He says of these three, "We are not dealing with a metaphysical theory, but are choosing a way of life."

His definition of Faith as Courage is the finest passage in the book: "Faith may be conceived of as a kind of courage or as a kind of knowledge. In the great texts of the New Testament in its praise, it is clearly conceived of as a kind of courage. It is that which conquers the fear of the darkness. It deals boldly and aggressively with the uncertain. . . . By faith men chose to live the life of pilgrims and strangers. . . . Obeying this inner impulse they went through fire and flood and put to flight the armies of aliens."

The great words of religion—Repentance, Forgiveness, Renunciation, Worship—are defined in terms of courage, and the lecture on courage ends with this fine paragraph:

"To one who has felt himself to be a prisoner of Fate the liberating moment comes when he turns from the uncertainties of the outward world to something which he discovers within himself.

He feels a spiritual impulse and dares to trust it. He has seen a great light; he resolves to follow it. Whither it will lead him he, as yet, knows not. He will take the risks. In that choice is his first experience of freedom."

It goes without saying that the delightful humor which irradiates the essays Dr. Crothers writes for the *Atlantic Monthly* and publishes in the annual volume which we hope for about Christmas time every year, is not so evident in these grave lectures on such a serious topic, delivered at a great University. But even here a glint sparkles occasionally as when he says, "Human history from this standpoint (the fatalistic) has only the same kind of interest that pertains to a weather report."

ALEXANDER JOHNSON.

SOCIAL PROGRAMS IN THE WEST

(The Barrows Lectures, 1912-1913.) By C. R. Henderson. The University of Chicago Press, 184 pp. Price \$1.25; by mail of THE SURVEY \$1.38.

Dr. Henderson has worthily fulfilled the purpose and spirit of his lectureship, which was founded "to promote the highest interests of humanity."

His aim has been to advise the people of the East what to do, but rather to tell them what is being done in the West to

deal with our economic and social problems, and to disclose the best purposes and methods of social work, and the highest ideals of the western world.

It would have been difficult, if not impossible, to find another so suitable ambassador of scholarship and religion to carry such a message to Asia. Foremost himself in the preparation of these social programs, and active in the efforts that have been made toward their fulfillment, Dr. Henderson has served half a lifetime in the ranks of social reformers, and has been an active official in many of the most important national and international organizations for social betterment.

The lecturer is permeated, as his every utterance shows, with a pure Christian faith, yet is the most tactful and tolerant of interpreters of Christianity to men of other beliefs. He does not go so far as to say to the heathen "You're a better man than I am, Gunga Din," but in generous spirit he comes near it. We should not like him to be jeopardized by heresy trial before theologians of the old type. He is wholly concerned with salvation, not with damnation, and loves the Orient because it gave us Christianity, rather than condemns it because it does not yet know Christ.

In his interpretation of the Christian culture of the West, the lecturer has, with his genial spirit, idealized the picture. He has dwelt on the good that is being done rather than on the evils that call for remedy. The honest Occidental must read many of these hopeful and inspiring pages, written not for his eyes,

but for those of the Oriental, with the mingled sensations of a man who by chance gets to read his own obituary, knowing his unworthiness but highly resolving to deserve these things the next time they are said.

In substance, these six lectures are little less than a comprehensive account of the plans of social amelioration now in actual process of application in Europe and America. They unite the qualities of conciseness in the statement of facts with literary finish in their comment and social philosophy. Nowhere else in equal compass is so good a survey to be had to put into the hands of one who would understand the meaning of modern, constructive, democratic, and scientific social reform.

FRANK A. FETTER.

DEMOCRACY IN NEW ZEALAND

By André Siegfried. Translated from the French by E. V. Burns with an introduction by Wm. Downie Stewart. G. Bell and Sons, London, The Macmillan Co., New York. 396 pp. Price \$1.75; by mail of THE SURVEY \$1.86.

The last decade has been one in which New Zealanders have been making history fast and in unexpected ways. The capitulation of the government to those who demanded freehold tenure of lands, the formation of a Parliamentary labor party with a definite labor

program, the rise of industrial unionism, the overthrow of the Liberal labor party after twenty consecutive years of power, are events none of which could be recounted, and few of which could be foretold, in André Siegfried's *Democracy in New Zealand*, written ten years ago and now first translated into English.

But if his is not the latest chapter and the one of greatest interest to those already familiar with this famous social laboratory, M. Siegfried's is for all perhaps the most penetrating and surely the most brilliant of the many interpretations of New Zealand history and of the New Zealand point of view. None but a Frenchman could expose with such keen yet gentle raillery the conservatism of these radicals, the trappings and respect for titles of these democrats, the abiding conviction of these remote islanders that not alone are they the chosen of the Lord but that He and all his less blessed peoples are guiding their actions by New Zealand precedents.

Few who have seen the New Zealand workingman in his native habitat will disagree with the author's conclusion: "There are three things which sharply distinguish him from the worker of the European Continent: he has scarcely any or no class hatred; he is not a revolutionary; he is only vaguely socialistic. . . . He has retained a certain curious innate admiration for money and for the man who lives in the grand style. Nor has he any greater

passion than to be like a middle-class man, and in his private life, in his dress, in his habits, to imitate those who are more fortunate than himself."

As good Anglo-Saxons carefully reserving the right of contradicting themselves whenever it seems useful to them, M. Siegfried altogether correctly finds "New Zealand reformers setting out with enthusiasm in the name of the loftiest principles, and we expect them to go right through with it and found a new heaven and earth. And then to our surprise, they call a halt; they change from revolutionaries into radicals; and the pretended Socialists become mere Democrats." Right again is the conclusion that "the result of the government's work is the very opposite of socialistic." "Is it socialistic," he asks, "to change exploitation on a large scale into exploitation by a multitude of less powerful men? This was all the French Revolution did. Is it socialistic to establish small holders on the crown lands and make them to all intents and purposes owners? Is it socialistic to create a class of small cultivators whose interests might well differ at some point from those of the workers in the large industries?"

A singularly discerning yet sympathetic criticism is this delightfully written account of a people who with unshakable confidence in their manifest destiny have initiated some and copied more.

PAUL KENNADAY.

BOYCOTTS AND THE LABOR STRUGGLE

By Harry W. Laidler. John Lane Co. 488 pp. Price, \$2.00; by mail of THE SURVEY \$2.16.

The general public is keenly interested at present in all phases of the labor movement. The interest is by no means merely theoretical. It has dawned on the average citizen that the labor movement carries within itself possibilities which may have grave consequences

and a careful consideration of which is of great practical importance.

Of all aspects of the labor movement the question of methods of struggle is the most fundamental. Upon the answer to it hinge not only immediate victory or defeat for either side, but such large matters as standards of living, growth of organization, social relationships, and ethical ideals. Regardless of its significance, however, it is probably the least understood part of the whole labor problem. In this field in particular, empiricism rooted in partisanship reigns supreme.

Because of this Mr. Laidler's book is especially valuable. It is a sincere and successful effort to describe the nature and effects of a weapon of industrial warfare which has aroused particular antagonism. The reader will find in it a description of all forms of the boycott, a history of the most im-

portant cases, and an analysis of the legal, economic and social questions involved. All this is done in a clear and readable style and in a spirit which must arouse even in the prejudiced reader a desire to see both sides of the question.

Mr. Laidler's main contention is that the boycott should be legalized. The legal argument in favor of this conclusion seems to me of minor importance. As Mr. Laidler himself shows in the hundred odd pages devoted to legal aspects, the principles involved in the boycott lend themselves to various legal interpretations. Experience has shown that the legal justification of a new attitude toward an economic or social problem is one of the easiest things to supply as soon as the attitude has come into existence. To create the latter something more than legal reasoning is necessary; society must open its eyes to the economic and social necessity of the new attitude.

On this point in particular will Mr. Laidler's book be of help to its readers. In fact, this seems to me the most valuable part—a real contribution to the subject. Mr. Laidler shows the intimate relation between various methods of industrial warfare and points out the consequences which the legalization of the boycott would have on strikes, trade agreements and other industrial problems.

One point suggested by reading the book may be indicated here. No matter what attitude the courts and public opinion take, the labor world is mainly interested in the economic possibilities of the boycott. Mr. Laidler has rendered a valuable service by analysing the conditions under which boycotts succeed or fail. Some of his conclusions on the point may serve as guides in the practical application of the boycott. Yet it would have been very helpful, had he made a more specific analysis of the statistics of boycotts in their relation to the conditions of industry, locality, organization, etc. This would have strengthened his general conclusions with which all who come in contact with labor problems will find it to their advantage to familiarize themselves.

LOUIS LEVINE.

CO-PARTNERSHIP AND PROFIT-SHARING

By Aneurin Williams. Henry Holt and Company. 256 pp. Price \$.50; by mail of THE SURVEY \$.56.

and with profit in the long run to all concerned." The practical qualifications of the writer are evidenced by the fact that he has devoted about twenty years of his life to the direction of the co-

partnership movement in Great Britain. The book considers both simple profit-sharing and the more promising movement of employers to associate employees in the ownership of share capital. It deals with firms of France, England and the United States only, beginning with the famous cases of Leclair and Owen and with the story of Guise, and then treating more recent instances of co-partnership.

The descriptive and expository chapters are clear, often quite detailed, and highly suggestive. The running comments are frequently of practical value. No critical attempt has, however, been made to measure the effect of co-partnership upon the interests of either employer or employee. The relative merits of the different types of co-partnership are not brought out. The prophecies seem unwarranted. The major value of the book lies in that it has placed an up-to-date compilation of important instances of profit-sharing and co-partnership in a concise and accessible volume.

JAMES FORD.

IN FREEDOM'S BIRTHPLACE: A STUDY OF THE BOSTON NEGROES

By John Daniels. Houghton, Mifflin Company. 496 pp. Price \$1.50; by mail of THE SURVEY \$1.62.

This is unquestionably the best study that has been made thus far of the Negro in a northern community. One thing that marks it off from similar studies on the same theme, is a painstaking effort to distinguish and characterize the two fundamental factors in the problem—race and environment—New England and the Negro—and to trace the effects upon each of their mutual reactions. The effect of the contacts of these two moral entities, an emancipated race and community in which, if anywhere, liberty had become a fetish, has been to apply to the claims of the one and the standards of the other the crucial test of practical life.

Reviewing results we may ask: First, What has the Negro done with his freedom where he has had it in the largest measure? Second, What has become of freedom itself in the country of its birth?

Naturally, to ask and answer, with resolute frankness, questions of this kind means that we shall receive some painful answers. There are judgments in Mr. Daniel's book—all the more poignant because of the deliberation and impartiality with which they are delivered—which are so searching as to suggest moral vivisection! However, as long as the ability of the Negro to live and prosper in an American environment is still so much a matter of speculation as to affect the attitude of his fellow citizens toward him, studies of this kind will be necessary.

This volume is not a mere compendium of facts but traces the growth and decline of the sentimental attitude to-

ward the Negro, growing out of his connection with the struggle for free institutions. Perhaps the actual extent of the change that has taken place is best represented in some words by Robert A. Woods, of the South End House, in the introduction to this volume. Mr. Woods speaks, among other things, of the "relative futility of scattered pleas for a flat parity of opportunity" and suggests that "a certain sort of segregation is, for the Negro, as for the immigrant, a provisional blessing," an expression which sounds almost shocking to those of us who have been bred in the anti-slavery sentiment of fifty years ago.

But they fairly represent the change which fifty years of freedom has made in the attitude of Boston toward the blackman and his cause. In fact, In Freedom's Birthplace is itself an evidence of this change. Still, neither these views nor this book should be taken as an indication that there has been anywhere in New England a surrender of the principles of fifty years ago. In Freedom's Birthplace is rather one indication that there has been no flagging in the determination to have in this country a democracy which shall ultimately include the Negro. What the volume does express, however, is the conviction that, in the light of later wisdom, it is necessary to face and meet the old problem in a new way.

ROBERT E. PARK.

LOOKING FORWARD

By Isaac Roberts. Roberts & Company. 315 pp. Price \$1.00; by mail of THE SURVEY \$1.10.

The purpose of Looking Forward is stated to be to bring "to the attention of average men and women" the advantage offered by co-operation. It consists of eight "conferences"—brief expositions of the principles of woman suffrage, public education, welfare work, co-operation and applied Christian ethics, woven together by means of a slight narrative presented almost invariably in the form of dialogue.

The book as its author clearly states "has not been written for the scientific mind." It offers no contribution to the subject. It unfortunately perpetuates the old American error of using the term "co-operation" in a loose, general sense. The book may be of value, however, in interesting untrained minds in a few of the live issues of our times.

"Yes," she continued, "we were always strong, except that I was not very well for about a year after we were married."

It seems that then she had grown very thin and had feared tuberculosis, but had recovered and was again healthy. There was, she declared, no epilepsy in her husband's family nor in hers, she felt sure. The boy's father was never sick, "but once," she added as an afterthought. Before their marriage he had "a sickness," but a doctor cured him and said that it was all right for him to marry.

"You see, lady, there is nothing," and again she almost sobbed. "Don't you think that my boy may be cured?"

What could one do but gladden the heart of the mother with praises for little Gloria? For in the boy's case there was no hope to give.

OLD BEES IN YOUNG BONNETS

Fred Brush

THEIR first impulse to serve beyond the home came through love of flowers. A woman householder at the edge of the hamlet was prevented, by injury, from starting her flower-beds that spring. For years her yard had been a show-place in the valley, and filled a large part in the woman's own rather lonely life.

Jane got seven girls together and went there one morning. "We've come to start the flowers—some of them; it's a little late, but we're bound to make the big bed, anyway; the folks can't really do without it," they announced.

Passers-by paused to see the group all in work-a-day attire, so busily and happily stirring the earth, and a man asked what the party or ceremony was called.

"A bee," laughed Jane.

There had come to her at the moment memory of the last of the old "bees" in that section, where as a little girl she had watched from a window thirty men and boys putting in a crippled neighbor's late hay, with noise and cheer, early finish, wrestling, and outdoor eating at the close.

"This isn't work at all; it's a bee," she called, and then had to tell most of her work-mates about the custom once so prevalent.

Before noon they stood astonished at what had been accomplished by their combined efforts.

"We could do it all, in another morning or two," they cried jubilantly; "let's finish it, and then tend it till she can be out."

Home they went to eat well and to talk of their new kind of bee-party.

They had several more such parties that year. The men joined in the third one. Half the cemetery, which sloped up from the main road in full view, had gone to neglect—was an eye-sore tangle.

Finger Prints

SINCE THE PURPOSE OF THIS COLUMN IS TO HELP, THE SURVEY REQUIRES THAT STORIES CONTRIBUTED TO IT SHALL BE ESSENTIALLY TRUE. ONLY AS PICTURES OF REAL LIFE CAN THEY HAVE ANY VALUE. THAT DOES NOT MEAN THAT ALL UGLY DETAILS MUST BE UNNECESSARILY BROUGHT OUT, BUT IT DOES MEAN THAT THE WRITER MUST KNOW HIS FACTS TO BE TRUE TO HUMAN EXPERIENCE AND SQUARE WITH THE RECORD, WHERE THERE IS ONE. ONLY WITH THIS ASSURANCE CAN CONTRIBUTIONS BE CONSIDERED.

"A SICKNESS"

D. Lucile Field Woodward

"CALL her Gloria," the mother said when asked the name of her little three-year-old girl, and added, "she is my bit of sunshine. Oh, lady," she almost sobbed, "if the boy were only like her! Don't you think he may some day be well?"

But the lady could give no hope. She could only say what she says to all mothers of epileptic boys who ask her that question: "All that possibly can be done shall be done."

Mrs. — came to America a few years ago with her husband and baby boy. The

husband, a musician, fell in love with another woman and with her returned to the old country, leaving his wife to make her way alone with her boy, who was then five years old. Gloria had not been born.

To make a living and prepare for the coming of the baby girl was hard enough, but when the boy began to have his "spells" the mother's courage almost failed her. The new baby, however, was so healthy that she soon took heart again and began to hope for the boy.

She took him to specialists and spent "much money." Finally one doctor said, "Take him to the seashore." Being a capable woman, Mrs. — soon found work in a seaside city. But the salt air did not help; the boy continued to have "spells."

Then one doctor said that she must not stay in the city, but should go into the country.

Again she moved for the baby's sake, and took a small garden farm. Here she lost all the money she had saved, and the doctor at last advised an institution for the boy.

When pressed for more history, the mother said, "No, there is nothing. None in the family ever had anything like it. My husband and I were both strong and all of our people were the same."

Additional space was needed; money for its betterment had several times been raised, but little done.

The girls proposed a bee, and a bee there was. All day the women were there with the men, and found a-plenty of lighter work to do. They built a fire in the rocks and served coffee and refreshment. The place was permanently reclaimed. No one was obliged to spend money; no one criticized others' use of it.

The bee had come back into that little community—a proven best way to accomplish certain good things. By this means running spring water was brought to the schoolhouse and the church above the hamlet, and their common grounds improved; the grange hall was repaired and added to, much of the interior work

done by the women. Three stretches of bad road were made good; the roadside trees were trimmed, some common walks laid, gardens planted and special crops "rushed" in at times for the handicapped or unfortunate.

Back on the hill a man and his boy fell sick in late autumn, and by midwinter the family was in distress. A "bee" got out from his wood lot and drew to the railroad enough ties and mine-timber to tide over the troubled times. The tree-remnants raised high his wood-pile.

These co-operations have bettered the spirit of the neighborhood, and notably upraised confidence in the strength of the community. The seven girls have continued to lead, until someone dubbed them "the bee girls." They rather like the name.

there was something I ought to understand, and did not, half terrified me, but usually I was indifferent about it. I had no other philosophy than that of doing today's work today—a philosophy that has this advantage, if industriously carried out: it gives one no chance to ask himself questions.

"I feel that when a man who has been imprisoned over four years with a wrecked body, and who has lost his home by fire, ventures to say that he is reasonably happy, and never enjoyed life so much, there is certainly some form of explanation due from him. And here you have it."

"Charlie" Willard had found the philosopher's stone.

MEYER LISSNER.

Personals

"CHARLIE" WILLARD was always my hero.

Even those of us favored with good health and strong physique have our off days, days of depression and discouragement. Charles Dwight Willard was always frail physically; for more than half his life he fought off the specter of the dread white plague. Through it all he was the cheery optimist. So long as he could hold up his head, he looked toward the sun. The world to him was getting better every day.

Willard was a trained newspaper man and writer. He came to California in 1886. On his arrival in the "land of sunshine" he was about "all in." As his health improved, he became active and for twenty-five years he did such effective work that at the time of his death it was generally recognized that his work and his influence had been among the most potent factors in the building up of the remarkable community in which he had made his home.

For a number of years he was secretary of the Los Angeles Chamber of Commerce, bringing it to a point where it became one of the admittedly leading commercial organizations of the nation. He organized the Municipal League of Los Angeles, the city's most powerful purely civic organization, and was still its secretary at the time of his death, although most of his time in later years was devoted to writing—mainly as contributing editor of the *California Outlook*, the organ of the progressive movement in California.

"Charlie" Willard's own words give a better insight to the character of the man than anything any one else could say. A year before he passed away he wrote a letter to some intimate personal friends in which he said:

"It is my good fortune to have almost the only profession in which a man can

earn a fair living and be sick-a-bed at the same time. How many of the hundreds of thousands who are afflicted with this disease are so fortunate? But after all, who are they in this world that really deserve pity? The unlucky? No. The sick? No. The poor? No. Who then? The unhappy—they and they only. And I am not unhappy. On the contrary, but for my knowledge that those who are dear to me are often troubled with fears on my account, I could truthfully say that this is the happiest period of my life.

"I have discovered that four years of illness coming to one who has led a life of considerable activity has one surprising form of compensation—it gives him a chance to think. Life was always an utter mystery to me—awesome and tantalizing. At times the sense that

T. J. EDMONDS
Chief Probation Officer, Cincinnati
Juvenile Court.

T. J. EDMONDS, since 1912 secretary of the Associated Charities of Cincinnati, is the new chief probation officer of the Hamilton county, Ohio, Juvenile Court. He was selected by the social workers of his city, who were requested by Frank Gorman, new judge of the court, to unite in nominating an experienced person for the position.

A native Ohioan, Mr. Edmonds, upon his graduation from Yale in 1906, was first employed by the Federation of Churches in New York and in settlement work. Later he did newspaper work in Pennsylvania. In 1910 he became business secretary of the Cincinnati Associated Charities, and a year afterwards general secretary.

Hamilton county is about to expend \$60,000 in the first widows' pensions it has ever granted. Plans are also on foot for the expansion of the court's activities next year when it will enlarge its functions under the court of domestic relations plan. It is the desire of those most interested to have made a successful demonstration of an idea which they believe will be copied.

It was because his training and record fitted him for these tasks that Mr. Edmonds was shouldered with his new responsibility.

THE trustees of the Philadelphia mothers' pension fund have chosen Helen Whitehead as chief investigator. Miss Whitehead has been for four years assistant superintendent of the Girls' House of Refuge at Sleighton Farms. Previous to this she had been a visitor for the Illinois Children's Home and Aid Society and assistant to the head worker at the Henry Booth Settlement, Chicago. She was graduated from the University of Chicago in 1904 and spent the following year in European travel.

WILLIAM A. Crossland, student in the department of sociology at the University of Chicago, has been elected executive secretary of the Social Welfare Board of St. Joseph, Mo. The Social Welfare Board is supported by funds from both city and county, and is practically free to inaugurate any sort of social work under the provisions of the law.

Communications

SOCIAL WORK AND ALCOHOL

TO THE EDITOR: May I express the deep gratification I feel on reading the eminently sane and timely article in your issue of March 21 by Elizabeth Tilton, and to voice the earnest hope that not only social workers but also teachers of economics and sociology in American institutions of learning may give earnest heed to the query, Are we neglecting the alcohol problem?

Permit one concrete suggestion: the introduction into the curricula of the schools of philanthropy, colleges and universities of the country of regularly accredited courses on the liquor problem. Would not this do much to hasten the day when the query, "Are social workers neglecting the alcohol problem?" may be confidently answered in the affirmative? The writer is at present conducting (for the first time) such a class, numbering nearly a hundred students, in the University of Southern California, where the subject justly attracts genuine interest.

ROCKWELL D. HUNT.

[Head of Department Economics and Sociology, University of Southern California.]

Los Angeles.

A QUESTION OF JUSTICE

TO THE EDITOR: Many church people believe that New York's unemployed were within their right in making an appeal to the churches for aid. The Carpenter of Nazareth gave food to the hungry. We, who profess to follow Him, ought not to resent the fact that hungry men enter church doors.

To suppose that hungry men would be arrested and adjudged criminals for making such a request for help, appears absurd. However, your issue of March 28 shows that this was done. No one, looking at the flashlight picture which you published, can deny that the men were orderly, and were retiring quietly at the time of their arrest.

Such court proceedings are not reassuring in the eyes of those who love justice. The heavy sentences imposed are liable to be taken as a condemnation, not of the men sentenced, but of the courts.

It would be well if through THE SURVEY we might become better acquainted with our courts and the men who influence them. What motives lie back of the decisions they hand down? Free government cannot long continue without courts that provide justice. It is no small matter for courts to render decisions which inspire public mistrust.

This letter does not say that the courts of New York are corrupt, or that any of her judges are dishonest. But it does say that we have a right to educate our courts in moral ideals, and to know that

every judge is honest. Many facts are unpleasantly disturbing. Rosenthal is dead, but it seems probable that Becker will be allowed presently to go free. Threats of bomb outrages among Italians are attributed to "black hand" society, but it is strangely unsafe to report these threats to officers who are not Italians. And, somehow, the offenders are in many cases immune to court proceedings. Unoffending and innocent people, however, are jailed, when they ask at church for a little food and shelter.

DANIEL S. McCORKLE.

Sunrise, Wyoming.

SCHOOL LUNCHEES

TO THE EDITOR: There have been some good answers to what I wrote the other day about school lunches. The following brought forward by Mrs. George B. Twitchell in THE SURVEY for March 14 seem to me points well taken in their favor:

1. Children should have good substantial food rather than candy, pickles and the like.

I feel this so strongly that I have often thought there ought to be a society for robbing children on the way to school, so that they should not be able to buy candy, pickles and the like. Merely taking the money away from them would be a benefit. The school lunch, if charged for, is a pure extra to the good.

2. It is a good argument that children are found who cannot study unless the school does give them a lunch. Also that children get so tired walking home that they can't eat their lunch when they get there (though I should not suppose this last would often be the case).

3. Another good point is that small children need to be fed in the middle of the morning. For these the argument is much the same as that for providing lunch in the high schools—being simply that they have got to have a lunch at a time when they cannot be at home.

Of course a lunch in the middle of the morning is a wholly different proposition from lunch which takes the place of the midday meal. If the children in the lower grades need it, the schools ought to see in one way or another that they get it.

The question seems to be whether these balance the good arguments on the other side, which as I see them are:

1. Free school lunches take away from parents what is probably the strongest human motive to the maintaining of a successful and orderly life.

2. They deprive some children of the home meal which would otherwise be provided, and which could almost always be provided if the community made up its mind that the home rather than the

school was the better place for the children to be fed. Of course some families are, as Mrs. Twitchell has pointed out, inevitably and hopelessly broken, but even in these cases the best course often is to find some other home for the child and then to keep it whole. There are always families on the border line who would be pushed across by any weakening of motive.

It is important to observe that a lunch in school is not necessarily a school lunch. Most of us can remember when we carried sandwiches in a grub box. I am sure I shall never forget the day I started to school with a Bartlett pear in my pocket and what I found there when the hungry moment came. In Boston we take some pains to get the parents to furnish the children with mid-morning lunches, and to see that the lunch is not pickles and candy but some form of human food.

Of course it is also clear that a school lunch of either kind need not be a hand-out but may be paid for by the children. The trouble here is that soft-hearted teachers will surreptitiously put either extra sugar into the cocoa or pennies into the children's pockets, so that the hand-out feature creeps in, and the more wretched the child can be made to appear, the more free feed he gets.

To me the most important moral is:—if you are going to have school lunches, you ought to have a good school and home visitor to find out just what the circumstances are. Indeed every school should have such a visitor anyway, and should, through her, plan to secure from the proper source a radical and thoroughgoing treatment in each case.

JOSEPH LEE.

Boston.

THE HIGH COST OF TEACHING

TO THE EDITOR: I am compelled to renounce my subscription to THE SURVEY, resorting to library copies of your paper. When other sociological explorations have been completed, THE SURVEY might turn its attention to the teaching class. A survey of this group would reveal a condition of low wages, struggle against the high cost of living (unaffected by tariff manipulation), and an effort to reach a standard of living set and demanded by the community, which will go far to explain any shortcomings observed among this class.

JOSEPHINE M. BURNHAM.

Wellesley, Mass.

A PRISONER'S LETTER

TO THE EDITOR: I never fail to get a huge amount of enjoyment from THE SURVEY and I want to take this opportunity to voice my thanks. I see you, too, have been inoculated with the prison reform movement. Volumes are being written on prison reform. The time seems ripe for periodical outcroppings of sage advice and suggestions. We who are confined in the prisons of New York state anxiously, eagerly, scan the columns of the press—only to be doomed to inevitable, bitter disappointment.

All the "reforms" instituted in the last decade were purely theoretical, and be-

cause they were only visionary, evanescent, theoretical dream-thoughts, the vital question confronts us: Why do men return to our prisons the second, even the third time?

The "reform" wave in New York state, practically had its inception in 1897, when the contract system was abolished. In 1904, "stripes" were partially removed; two years later, all the prison population was clothed in gray, yet, in spite of these "reforms" it did not diminish the percentage of those who returned for the second time.

Mid the rattle and bang of committee meetings, of rippling reform waves and more or less grave and learned (?), mostly super-esthetic, but ridiculously maudlin, inadequate, wofully inconsequent theories, resolutions, and fancy stunts, served a la mode by the average, no doubt, earnest, but lamentably misguided and unqualified, prison reform society, the same old question is still going its senile rounds. Is the convict a product of regular, ordinary human clay, to be dealt with on the simple hypothesis that he is, perforce, prone to err? Or is he, mayhap, as some of our adolescent reformers would seem to imply, an extraordinary abnormality of nature, composed of pure, unadulterated gobs of re-inforced muck, with the further and, of course, natural conclusion that no possible good can emanate from such a course?

And yet, was it not said, "no good can come out of Nazareth"?

Theory is doomed. The real, the practical, the genuine, is surely, implacably superseding these moss-covered, stale, criminally silly platitudes. A vast amount of mushy sentimentality is being gratuitously thrown at the men behind the walls, tending to arouse the nauseous specter of self pity. That does not help, it degrades—and it doesn't answer the question: Why do the men return to prison again? and the answer: They are forced back.

The power of the human soul cannot be measured; no man guesses the real strength of his fellow man. It is an undisputed fact, that upon leaving prison, every man is prejudged. We are all damned alike—the foul rape fiend with the chap who commits a crime because he ignored the admonition, "vengeance is mine"; the fellow who leaves the big gate behind, who takes no thought of the future, with the man who sincerely, honestly, wants to be clean and straight. Ninety-nine per cent of the men who leave prison, really, sincerely, want to make good. The public will not let them.

Let me give you a glimpse of the "returning" process. I am an advertising expert, fully capable of earning at least \$3,000 a year. I apply to an agency for employment; I demonstrate my ability and, in spite of this, I am offered work at \$10 to \$12 a week, simply because I dare compete with my more virtuous brother. The sickly, petered out, bromide, "you'll have to start at the bottom" is a pitiful, unscrupulous, hypocritical lie. They will get the same quality and amount of work that a \$3,000 man gives for \$10 or \$12 and pocket the difference with smug complacency. I am

treated with scant courtesy. Every hour of the day I am shown, in a hundred different ways, that I am there on sufferance only. In reality, my employer is mentally shaking hands with himself, only he fears to show it—the glad hand of friendship isn't extended. He seems to fear contamination.

It takes a smashing good man to stand the razzle-dazzle of a prison term and stay sweet. The average prisoner builds mighty plans for redeeming the past. Prison-born ideas, however, when stacked against stern, relentless, immutable reality, somehow do not seem as alluring, as genuine, on the outside of the gate. His fight is against tradition, the community; and if he fails—will you not concede that the scrap was an intensely bitter one and pitifully uneven?

Reform! Why the very word itself is a paradox, a misnomer; it's so much larger and immeasurably more human and sentient than the great majority of men realize. Rather let the attitude of society reform, reform its vague, unreliable conceptions of the prisoner. Intellectual emancipation is the only reform that is really reform, and that only can come from without, from those who arrogate to themselves the lofty attitude of "I am holier than thou."

Intellectual emancipation! Aye, set the mind free, and out of chaos, will arise, majestically, benignly, reform. Psychologists have demonstrated that man invariably travels a round-about course in his mental gyrations, even with the most simple ideas; we scarcely ever think directly to them, but go off at a tangent. Isn't it ridiculous to hear every other person solemnly assert their belief that man—another animal, bear in mind—can be reformed and reshaped from his natural bent, this bent being the natural expression of his inherent instincts?

I refuse, most emphatically, the implication, that I will ever reform. To bring my contention home, I deny that there is anything in me to reform (I refer to the criminal aspect). I will reorder my life—get back to first principles—I realize that my scheme of things spells chaos, but, in redeeming my birthright—ye gods! that isn't reform.

Let those in prison work for men's wages; give them something to strive for; an end to appeal to their ambitions—make it part of the prison system to provide jobs for the home-going prisoner, and not require a friendless man—often an illiterate foreigner—to provide his own job. Work along these lines, and you will begin to realize something of the Utopian dream.

When June shall have arrived, I, too, go forth to do battle with the world. I shall not be forced back, because it's a labor of love that I have set my hand to; not all love, rather something on an infinite plane with love: power, prestige, money, rehabilitation; the cementing of ties I wilfully cut asunder; the making of true, genuine friends.

Lack of funds will often obstruct my way—temptation, prejudice, ostracism, mayhap, all these will make the fight long and tortuous—but I'll win in the

end, because right, not might, will be my guiding star.

The time is ripe for the emancipation of the prisoner, may the gods prove propitious. We, the prisoners of New York state, are pinning our faith on the Hon. John W. Riley, superintendent of state prisons. Nightly prayers arise, to the end that he be given strength and aid to do the things that are only just and proper. The state of New York has reason to be proud of such a man, it must come to his aid now, else his efforts will come to naught.

LEW M. DAVIS.

[No. 10294, State Prison.]

SOME INFORMATION FOR MOTHER

TO THE EDITOR: I like immensely Mr. Gavit's article on sex instruction. Mrs. Bruere read it to me one evening, as an example of an exceptionally sane and helpful way of giving children the right point of view toward sex functions. There was just a touch of romance in it, which may not be necessary, but the idea was splendid and many of us are in consequence indebted to Mr. Gavit.

HENRY BRUERE.

[City Chamberlain.]

New York.

TO THE EDITOR: Some Information for Mother puts very graphically what many of us have long felt.

The desire of the child to know how it came to be here is the most natural one in the world. It is a part of that great instinct of reproduction which in its force is second only to the instinct of self-preservation—both, indeed, really existing for the preservation of the race. Nature cares for the individual only in so far as the welfare of the race is wrapped up in him.

The gratification of this desire for knowledge on our children's part is their right, and, it is, moreover, their salvation, for if it is not gratified by those who should respond to it, the active-minded child will find other means of information, with the too frequent result not only of learning much that is untrue, but, what is much more serious, of learning the most sacred facts of human existence from the lips of those to whom these facts have no significance beyond the gratification of animal appetite, and whom the whole subject thrills with the disgusting fascination of forbidden delights.

Mr. Gavit's story is very delightful and true to life, both in the response of the child to the truth when it is told to it, and in the half-baked attempt of the mother to give this truth to the child. There are many such attempts today, for it has become the fashion to tell children the laws of reproduction—a fashion very excellent if it be done with knowledge and with reverence, but not unmixed with danger, if it be done stupidly and without co-ordination. Even so, it is probably better than the old stories of storks' and doctors' bags, but why go halfway when the whole road is such a beautiful one to travel with a child?

To the "Iconoclast's" statement that "the baby stays in the mother-nest until the time comes for it to be born," the child exclaims, "Isn't that beautiful! Now, why didn't my mother tell me that?"

The strength of the reproductive instinct is shown by the universal desire of children to play house—they are always playing at father, mother and children, and the normal child feels—just as Mr. Gavit shows it to—the beauty of the transmission of life. If a child is told the truth about this great gift which we have all received and which we may in turn pass on, it will feel the reverence which this transcendent function must inspire in an uncorrupted mind.

Even a young child can be appealed to on behalf of the future, not its future alone, but the future of those for whom it will some day be responsible. And if it is made to understand the proper purpose of the sexual organs, abuse of these organs and later abuse of their function will be next to impossible. This reverence it is the privilege of parents to impart. "Happy is the people that is in such a case."

MRS. WILLIAM LOWELL PUTNAM.

Boston.

"CONSIDER THE OTHER FELLOW"

TO THE EDITOR, I am glad to see that Mr. Joseph Lee (I wish I could say Cousin Joseph) agrees that I am right in saying that inventors are not recognized as they should be by capitalists, and that this is the key to the situation. Mr. Lee says that the real point is "What is there that can be done about it?" and Mr. Lee adds, "Tell us what to do and we are with you."

Of course, telling a world what to do is not an off-hand topic that one can take up in the form of a little hopeful reply to Mr. Lee or Major Higginson, but, in spite of a certain sense of humor which gets its chance once in a while, I was just being sorely tempted to try to do it, when suddenly it occurred to me that I had done it before, that I had just published a reply (five hundred and sixty-one pages or so) which I have spent some twenty years in growing up to write, and some forty years struggling to believe, and if Mr. Joseph Lee, instead of gracefully wishing to be my cousin, would really be serious, buckle down, saw wood, and read my book and not put me off as mere relative it would be, possibly, all thing considered, the best way out.

It is true, as Mr. Lee suggests, that there is nothing new in the world's failure to recognize inventors. The astonishing and revolutionary fact—the one I like to make a stand for, is, that in an age of machinery, a sweeping change is taking place before our eyes in regard to the world's attitude toward inventors. It is getting to be their world. Everybody (millions and all) is about to know to them.

It is this revolutionary attitude toward inventors, or men with imagination, social inventors, world engineers and others that I have been trying to begin to express in *Crowds*. It puts a

new face on the world for me, and contradicts all the expectations and beliefs I had thought I had since I have begun to reckon with it—especially since I have begun to apply it to what we can all personally do to help the inventors to hurry.

There is one thing I want to add, I hope my little article in *THE SURVEY* is not going to leave me mixed up in anybody's mind with the people who are "shooting the organist" as Mr. Lee intimates.

I would rather blow the organ for him, and indeed this very week am I not blowing the organ (*Harper's Weekly* for March 14) for Mr. Henry Ford, and I am sorry if my letter, to any one, seems to identify me with the war against capital just because it is capital. There is not a day passes but I rejoice in some rich man—even one who is not so violently rich, if he sees how he can do something.

Well, as I was going to say, Mr. Editor, I do wish *THE SURVEY* would start a movement to get Mr. Joseph Lee to read *Crowds*. If it cannot do better let it try to pry him through two chapters—the first two ones in the fifth book, *News and Labor* and *News and Money* ending like this:

"Religion can be expressed much better today in a stockholders' meeting than it can in a prayer meeting.

"Charles Cabot, of Boston, walked in quietly to the stockholders' meeting of the steel trust one day and with a little touch of money—\$2,900 in one hand, and a copy of the *American Magazine* in the other—made (with \$2,900) \$1,468,000,000 do right."

JOTTINGS

NEW SETTLEMENT IN HARLEM

The Henry Meinhard Memorial House, a social settlement, has recently been established at 100 East 101st street, New York city, by Morton H. Meinhard as a memorial to his father. The headworker is Morris J. Wessel. The district is Jewish, but the policy of the settlement will be non-sectarian. Among the activities announced will be an employment bureau to find work for the young people of the neighborhood in lines which have the greatest future, which the settlement believes will "lie in the relations between the producer, transporter and consumer."

DEMONSTRATING MORAL EDUCATION

Since coming to this country several months ago, F. J. Gould, demonstrator and lecturer of the British Moral Education League, has visited thirty large cities, seven universities and is said to have addressed 14,000 teachers and persons interested in the education of the

young. In bringing him here the International Child Welfare League co-operated with the University of Wisconsin.

Mr. Gould has demonstrated his methods with classes of children. One of the points he tries to impress upon them is that in being of service to others a kindly intention is not enough; they must be ready with specific suggestions and ways of making their willingness effective.

MAP OF CRIME

A map of Kansas showing the proportionate number of men received at the state penitentiary from all counties from 1909 to 1913 inclusive has been prepared under the direction of Warden J. T. Botkin. The nearer the penitentiary you get the more crime you find, the crime center being only forty-five miles west of the prison at Lansing. The so-called "wet counties," where prohibition laws are poorly enforced, show the most criminals. A new ruling of the Board of Corrections requires every prisoner to have a medical and psychological examination by the prison physician, J. T. Faulkner, and it is now possible to learn the number of mental defectives entering this prison.

AIDING STRANDED AMERICANS

The American Benevolent Association of Berlin, which grants relief to American citizens, aided 108 persons during 1913. Among them were two physicians, two civil engineers, one druggist, five music students, one lawyer, one student of philosophy, one locomotive engineer, six sailors, one university professor and one farmer. It has a budget of 6921.41 marks. An interesting paragraph in the report records that the association appealed to 500 Americans registered at the four leading hotels, suggesting that they spare the association one of their express checks. "Not a single pfenning or a single reply was received." The executive work is done by S. Miles Bouton, an American journalist in Berlin.

GOLDEN RULE AGAIN

The Golden Rule, for which Cleveland police once were famous, is to have a new lease on life under Thomas M. Kennedy, new judge of the criminal branch of the Common Pleas Court, a disciple of Brand Whitlock. Parole from the bench for first offenders where circumstances are mitigating, personal supervision of his own paroled subjects, man-to-man talks with those who come before him, the giving of sentences to fit the man rather than the crime, a new application of the indeterminate sentence law, restriction of police persecution and hearty co-operation with the county prosecutor—these are some of the elements of Judge Kennedy's Golden Rule policy. "Parole from the bench is the greatest weapon for mending the broken men and women of society that we have today," is his point of view.

THE SURVEY ASSOCIATES, INC., is an adventure in co-operative journalism: incorporated under the laws of the state of New York, November, 1912, as a membership organization without shares or stockholders. Membership is open to readers who become contributors of \$10 or more a year. It is this widespread, convinced backing and personal interest which has made THE SURVEY a living thing.

THE SURVEY is a weekly journal of constructive philanthropy, founded in the 90's by the Century Organization Society of the City of New York. The first weekly issue of each month appears as an enlarged magazine number.

From the start, the magazine and its related activities have been broadly conceived as an educational enterprise, to be employed and developed beyond the limits of advertising and commercial receipts.

Price

Single copies of this issue twenty five cents. Co-operating subscriptions \$10 a year. Regular subscriptions \$3 a year. Foreign postage \$1 extra. Canadian 75 cents.

COPYRIGHT, 1914, BY SURVEY ASSOCIATES, INC.
ENTERED AT THE POST OFFICE, NEW YORK, AS SECOND CLASS MATTER

The GIST of IT—

PROBABLY two score lives have been taken—two-thirds of them women and children—in pitched battles between the striking coal miners and the militia in Colorado. The troops, turned machine guns on the tent colony at Ludlow, where the men and their families had lived on leased ground since the strike began last September. Page 109. President Wilson has asked John D. Rockefeller to intervene. Page 160.

COOPER UNION, which has sheltered all sorts and conditions of protestants since slavery days, was the scene of the women's mass meeting to protest against war in Mexico and Colorado. Page 107.

NORMAN ANGELL, visiting peace plenipotentiary from Europe, has told vividly what war with Mexico will mean. Page 159.

SINCE January 1, 1905, the American Red Cross has administered relief in 60 disasters—an average of one every eight weeks for nine years. It has expended over \$12,000,000. Fifteen of these catastrophes caused direct injury to the person or property of 1,500,000 people.

HERE is cause enough for a special number of THE SURVEY. Disaster relief is coming to be as much a profession and an art as organized charity. To emphasize its importance and define its principles is the purpose of these articles.

MR. BICKNELL opens by differentiating between the kinds of disasters, stating principles of relief, and telling what each community can do for itself. Page 113.

COMMANDER BELKNAP tells how emergent and permanent help were brought to the Messina earthquake sufferers (p. 116); Mr. Deacon how a mine company applied the principles of workmen's compensation to the families of killed employes (p. 119); Mr. Persons tells how the Volturmo's survivors were cared for (p. 121); and Miss Grant how Omaha met its tornado (p. 122). Mr. Himes draws lessons from his experience with Mississippi inundations (p. 126); and Mr. Sarvis describes the manner in which China's latest famine call was answered (p. 126).

CHINA'S flood and famine calls go back to legend, but at this moment a project to reclaim her rivers and prevent her floods is moving to a head. Mr. Lane gives the details. Page 129.

PART II of this series deals intensively with the relief work following the great floods in the Ohio and Mississippi valleys last spring. What Ohio did is told by Mr. Burba (p. 137), while Mr. Stein describes the national response (p. 139). Mr. Hubbard tells how he carried relief to scattered towns in three valleys (p. 142), and Miss Bojesen (p. 143) and Mr. Devine (p. 147) dwell on Dayton.

TO round off, Mr. Knowles relates the latest news of flood prevention in this country. Page 151.

THE SURVEY

COMMON WELFARE

PHILADELPHIA'S PRESCRIPTION FOR CLEAN-UP WEEK

"CLEAN-UP-WEEK" is getting to be almost as much of a civic institution as the Sane Fourth. Scores of cities and towns have entered into the effort this year. Their mayors have designated a given week in April or May when extra teams and men are added to the force of ash collectors.

In Philadelphia a leaflet for a "spick and span" city has been issued, containing directions for the householder. Here are the "chores": Remove all rubbish and waste material from your rooms, closets, hallways, garrets, roof, cellar, fire escape, and yard; don't overlook dark corners and out-of-the-way places; clean up vacant lots; use disinfectants after cleaning; white-wash cellar walls, out-houses, sheds and fences; clean and paint your screens and put them in place; sow grass seed on vacant lots and bare spots in your yard; plant flowers in back-yards and porch boxes; fill in low ground and spread a little kerosene on stagnant water to kill mosquitoes.

The last page of the leaflet is a sign with "rubbish" in big letters. This is to be hung in the window as a notice for the city collector. The school children were given buttons to wear, bearing the words "Help us clean up Philadelphia"; the Department of Health issued bulletins telling in detail how to prevent flies and mosquitoes; many avenues of pub-

licity kept the subject constantly before the people; and the challenge was put directly:

"Why don't they keep the streets a little cleaner?"

You ask with deep annoyance not undue, "Why don't they keep the parks a little greener?"

Did you ever stop to think that *THEY* means *YOU*?

WOMAN'S MASS MEETING TO PROTEST AGAINST WAR

MORE THAN 2,000 people assembled to condemn war—in Mexico and Colorado—at a protest meeting organized by the women of New York city at Cooper Union, April 24.

"Such a gathering," said Charlotte Perkins Gilman, one of the speakers, "represents the spirit of the masses who must do the dying and the paying in these wars instigated by economic interests, which proverbially seek protection, and fomented by other interests which make war and news of war a marketable product. When this spirit of protest makes itself heard above the interests, and the people stop, no power on earth can make them go on. Then war will cease."

All the speakers, Charlotte Perkins Gilman, Mary Shaw, Harriet Stanton Blatch, Helen Todd of California and Florence Kelley, emphasized the right of women who "suffer without any music" to denounce a war declared without their consent and demanding the sacrifice of their children. Mrs. Blatch pointed out that behind every man marching to the front is a vacancy in the industrial army at the rear which must be filled by brave wives and daughters.

The invasion of Mexico was coupled

CLEAN-UP WEEK—FATHER PENN ON THE JOB WITH HIS BESOM

by nearly every speaker with the civil war in the Colorado strike region. "Are we so humane, so advanced," questioned Florence Kelley, "that we should endeavor to teach foreign people?"

This resolution was adopted:

"RESOLVED: That this mass meeting of men and women assembled in Cooper Union on April 23, 1914, call upon the President to put the noble words he has uttered in the past into deeds. We ask him to withdraw our troops from Mexico and thus with true courage and the finest sense of honor repair the harm already done."

This resolution, prepared in advance, was proposed from the platform by the chairman, Mrs. Henry Villard. But the audience demanded that it be supplemented by a second resolution. Marie MacDonald, a well-known Socialist speaker, moved from the floor that "this assemblage go on record as denouncing the treatment accorded the miners and especially that brave unflinching woman, Mother Jones, by the militia of Colorado with the sanction of state and federal officials."

The appeal was cheered and adopted without a single negative vote. Copies of both resolutions were forwarded to President Wilson.

FULL APPROPRIATION FOR THE CHILDREN'S BUREAU

THE PASSAGE by the House of Representatives of the total appropriation requested by Julia C. Lathrop as chief of the Children's Bureau was good news to the large number of social workers and others who have shown keen interest in this new and developing social activity by the federal government.

Although, as reported in *THE SURVEY* for April 11, the appropriations committee had scaled the amount down from the \$164,640 asked to \$25,640, the sum appropriated for the first experimental period ending this June, the question was vigorously discussed on the floor and by a roll call vote of 276 to 47 the full appropriation was carried on April 17.

The expenditure of the money, according to the bill as passed, seems to be limited to investigations of the subjects of infant mortality and dangerous occupations. The law creating the bureau defined its work as to investigate "all matters pertaining to the welfare of children," and "especially to investigate infant mortality, the birth rate, orphanage, juvenile courts, desertion, dangerous occupations, accidents and diseases of children, employment, and legislation affecting children in the several states, and territories."

The friends of the bureau and its work are anxious that the Senate agree to the full appropriation but apportion it not only for the two purposes mentioned in the bill, but according to the plans proposed by the bureau, which have been carefully threshed out and formulated.

TENT COLONY OF STRIKERS SWEEPED BY MACHINE GUNS

MACHINE GUNS pumping 400 soft-nosed bullets a minute were turned on the Ludlow tent colony of coal miners in southern Colorado last week. Press dispatches report 25 to 45 people killed, two-thirds of them women and children, the complete destruction of the camp, and a new flare-up of the bitter hostilities between strikers on one side, the state militia and the guards hired

THE LEADER AT LUDLOW

An investigating committee reported some months ago that the militia would try to "get" Louis Tikas, a Greek miner and an organizer of the union. The *New York Times* reports his death last week as follows: "[He] was shot as he attempted to lead a group of women away from the camp in the direction of an arroya which offered shelter. According to witnesses of his death, Tikas threw up his arms to show that he carried no weapons. The troopers yelled at him to run and shot him as he fled."

The photograph, taken some time ago, shows Tikas at the well which formed the sole water supply for the 900 persons at the Ludlow camp. The barbed wire at the left had been rammed down the well to put it out of commission. The strikers charge the militia with doing it.

by the mining companies on the other side.

The trouble is in the district operated by the Colorado Fuel and Iron Company, in which the Rockefellers hold the controlling interest. This battle—the first day's fighting lasted fourteen hours—is the latest clash of armed forces in an industrial warfare which has torn Colorado for thirty years.

For the information regarding Ludlow

which follows and the accompanying illustrations, *THE SURVEY* is indebted to Henry A. Atkinson, secretary of the Social Service Commission of the Congregational Churches, who has just returned from Colorado, where he made a careful study of strike conditions.

The Ludlow colony is one of the many tent colonies established by the strikers at the time the strike was called September 23, 1913. This colony, 18 miles north of Trinidad on the direct road to Walsenburg, was a strategic position for the miners, as it enabled them to keep watch on the station of the Colorado Southern Railroad at Ludlow where strike-breakers would detrain for several important mines.

The land on which the colony was located was leased by the United Mine Workers of America, who furnished the tents and have supported the colony. There were 178 tents, housing 900 people, of whom 271 were children, twenty-one babies having been born there since October. When the strike was called, the men and their families moved from company houses into the tents, and have lived there all winter in the snow.

The great majority of the people do not speak English. For the most part they are strike-breakers brought into Colorado during the bitter struggle of ten years ago, who have themselves become unionized. Twenty-one nationalities are represented, Greeks and Italians making up the largest number.

Last December, at the suggestion of Governor Ammon, a committee of five was appointed by John R. McLennon of the State Federation of Labor to investigate charges made against the militia in the Denver convention of the federation. This committee was a representative one. James H. Brewster, who wrote the report, was for years professor of law at the University of Michigan, an impartial citizen who had gone to Colorado for his health.

The governor empowered the committee to fully investigate conditions and take testimony. The stenographic records of 163 witnesses filled 760 typewritten pages. The testimony made a red hot union man of Mr. Brewster, and he consented to conduct the case of the unions before the Congressional Investigating Committee.

In their report, the five men on the committee unanimously agreed that Lieut. E. K. Linderfelt, who was in charge of the militia quartered near Ludlow, was doing all in his power to provoke the strikers to violence. It seemed to the committee that he was especially anxious to get Louis Tikas into trouble. Once he arrested him for some trivial offence and held him without lodging a charge against him. The report reads:

"We have reason to believe that it is his [Linderfelt's] deliberate purpose to provoke the strikers to bloodshed. Every

THE COLORADO TENT COLONY SHOT UP BY THE MILITIA

Ludlow, a canvas community of 900 souls, was riddled with machine guns shooting 400 bullets a minute. Then the tents were burned. The site is private property leased by the miners' union, which has supported the colony seven months.

decent member of the militia who knows Louis Tikas will testify that he is an admirable man for the place he fills; that he is fair, and that he will assist the militia in every proper way in policing the neighborhood, yet it is this man whom Linderfelt tries to provoke in order that some other members of the colony will be aroused out of sympathy, and it is this man whom Linderfelt is reported to have threatened to kill on the slightest provocation."

Louis Tikas was killed by the militia under Linderfelt in last week's attack on the camp.

The machine guns used against the strikers were brought into the state at the suggestion of A. C. Felts of the Baldwin-Felts Detective Agency, and they were paid for by the coal companies. The same guards and gunmen are being used in Colorado that were used in the West Virginia coal strike. These men were the first to shed blood in

this Colorado strike. Last August Gerald Lipiatt, an organizer for the United Mine Workers of America, was killed on the streets of Trinidad, and his death was followed immediately by serious disorder and more lawlessness.

Mr. Atkinson says:

"In every industrial war wrongs are committed on both sides, but it is difficult to see at this distance any justification in state troops being used to make war on women and children. This was the third attempt to take Ludlow.

"The Colorado miners have suffered. This is the fourth bitter strike in thirty years, and the causes of strife have been virtually the same in each instance. The companies do not obey the law. Miners are killed, their families suffer, they are defrauded of their pay, and denied the right to organize for their own protection.

"Governor Ammons offered a proposed arbitration agreement which was refused

by the strikers. The five propositions suggested by him were *prima facie* evidence of the lawlessness of the companies. Each proposition related to a law that was being violated. The whole proposal simmered down to a single statement is this: 'If you coal diggers will give up your union, the operators promise to obey the state laws which have been passed for your protection.'

"Script is still being issued by some of the companies, although Mr. Welborn, president of the Colorado Fuel & Iron Company, says its use was discontinued by his company on January 1, 1913. The miners feel under unjust obligation to trade at the companies' stores. Many of the mines have company-owned and other company-controlled saloons, and script is issued to the miners on these saloons. Accidents are common, verdicts against the companies by coroners' juries rare. The men feel that they do much work for which they receive no pay—that they are short-weighted in their coal and over-charged

These are the striking miners and their families who were shot down wholesale by the Colorado militia last week. More than two-thirds of the dead are reported to be women and children. All had lived here in the open since September.

for their oil and powder. If they complain they stand a good chance of being discharged."

Mr. Atkinson summed up the situation by stating that in his opinion there are three fundamental wrongs involved:

"1. The miners are being denied their constitutional rights—law is a dead letter in a section of Colorado 100 miles square.

"2. The state militia is being used, not to restore and preserve law and order, but to break the strike.

"3. The coal companies, by controlling and dominating the political situation, deny the miners economic and social justice."

POLICE WOMEN'S EFFICIENCY IN DANGER

SOME OF THE most influential clubs and civic organizations of Chicago have protested vigorously against the action of Chief of Police Gleason in regard to the city's twenty policewomen. Under Second Deputy Superintendent Funkhouser, the civilian police official, they have proved effective in regulating public dance halls. Under Second Deputy Superintendent Schuettler, to whose command they have been transferred, they are assigned to regular police duty, scattered among various station houses, and can no longer be used for inspection of dance halls or other pieces of work requiring concerted action.

In making over 1,500 inspections of dance halls, in which they found many violations of law for which arrests might have been made, the women officers, being more intent upon prevention than punishment, determined to make no arrests at first, but to warn the managers and to win the girls who patronize the dances. This policy has proved successful in securing obedience to law and observance of propriety.

Such results in the dance halls made the second deputy's administration a shining mark for assaults from the underworld, just as his strict censorship of motion pictures has attracted opposition from those who make and promote films suggestive of evil. Such enemies of public safety and common decency are believed to have found aid and comfort at the hands of certain police officials and of others higher up.

It is feared that the *fine esprit de corps* of the new women police will suffer by being forced to conform to the varying standards of the stations to which they have been assigned.

The ostensible reason for taking them away from Major Funkhouser is that his use of their service transcends his function as the civilian deputy and belongs to the active force. But his squad of male officers is left under his command, apparently without fear of inconsistency, perhaps because under the surface it is not inconsistent with the purpose dictating the transfer of the women.

THE RED CROSS AND WAR

In event of war, the Red Cross activities will probably be substantially as follows:

Nurses will be provided for care of the sick and wounded at large hospitals located convenient to, but at a safe distance from, the field of military operations. To these hospitals, soldiers and sailors will be conveyed after preliminary care at field hospitals. Both army and navy are likely to require several of these base hospitals.

The Red Cross will supply physicians and surgeons for service at these hospitals, and men for transportation of the wounded.

Another important duty will be the preparation, collection and distribution of hospital supplies of a character designated by the army and navy medical corps.

Another duty required of the Red Cross by law is the organization and maintenance of an information bureau to serve as a link of communication between the army and navy and the people back home. This bureau will be expected to establish branches in connection with each important army base. It will keep a record of those killed and of those wounded or sick in hospitals, and will communicate the facts to relative and friends. This bureau will also be expected to answer inquiries which will doubtless be received in large numbers from every part of the country.

The extent of the Red Cross service in any event, will depend upon the magnitude of the military operations which call it into service. While it is hoped that the situation in Mexico may not assume such proportions as to require Red Cross participation, it is necessary that the society be prepared for instant action if called upon.

to localities for local purposes \$3,923,731, or 9.43 per cent of the total taxes, while for state purposes there was retained only \$3,731,587, or 8.97 per cent of the total taxes.

The more fundamental point is made, however, that those who cry high taxes do not take into consideration the measure of service rendered by the state government. To make this clear the exponents of the state's activities, which have commanded the attention of the nation, are starting a constructive campaign of publicity to analyze governmental expenditures in the light of governmental service.

ONE COURT FOR THE WHOLE FAMILY

UNDER THE leadership of the Council of Social Agencies, Cincinnati social and civic organizations secured enactment at the special session of the Ohio General Assembly, just closed, of two laws amending the juvenile court act to create a court of domestic relations for Hamilton County. By combining with the former work of the juvenile court all divorce jurisdiction and most of the failure-to-provide and non-support cases, Cincinnati secures the first court for dealing with the family status. A third law, which would have placed non-support cases now appearing in municipal and magistrates courts in the new jurisdiction was defeated by humane societies laboring under the misunderstanding that they would be eliminated.

The new court is made a branch of the Common Pleas Court, the highest judicial tribunal in the county, thereby gaining a dignity which the old juvenile courts of Ohio never attained. The judge is to be nominated and elected on a non-partisan ballot and to devote his full time to the work, a further advance over the former law. Uncontested divorce cases are to be investigated by probation officers.

In a brief prepared by the committee in charge of the legislation, it was stated that divorce cases now tried in other county courts are subject to the most superficial investigation, resulting in the granting of numerous divorces for petty reasons that could be adjusted; an organized business of securing divorces exists which is ruinous to the best interests of the home; and divorces are granted in such numbers that protests from churchmen and others interested in the purity of the marital relation are almost weekly occurrences.

Jurisdiction over failure to provide cases by other courts has almost resulted in a nullification of the law. In 1912 2,861 children were deserted in Cincinnati by 1,466 fathers, and no effort made to locate a majority of the fathers. Only 33 per cent of bread-winners guilty of non-support and ordered to pay weekly amounts for the benefit of their fami-

WISCONSIN TAXES AND STATE PUBLIC SERVICE

OPPONENTS of the progressive activities of the state government and state university in Wisconsin are now raising the cry of high taxes and economy. The so-called "Home Rule League" has been organized to stimulate the feeling that the state government costs too much.

It is pointed out by those who are defending the state government against this cry of a high tax rate, that a large proportion of the taxes collected by the state was returned to localities. The total tax last year was \$41,596,960. Of this amount \$8,116,518, or nearly 20 per cent, was raised by counties for county purposes; \$25,825,123, or 62 per cent, was raised by villages, towns and cities; and \$7,655,318, or about 18 per cent, was raised by the state. Of the amount raised by the state there was returned

lies obeyed the order. Homes are unnecessarily broken up as 48 per cent of the dependent children appearing in court in one year had been sent to institutions, although proper effort in many cases could have saved the family.

It frequently happens that members of a single family appear in insolvency court for a divorce; in police or magistrates' courts for failure to provide; and in juvenile court for delinquency of a minor. Each court adopting a different policy without reference to the others, creates a chaotic and hopeless tangle of the family affairs.

Those who were instrumental in securing passage of the laws propose to select a nominee for the judgeship to be entered in the fall election, and to conduct a campaign for him.

TRACHOMA IN OHIO SPREAD IN LODGINGS

THE FEDERAL Public Health Service has made an investigation of trachoma among the employees of the Youngstown Sheet and Tube Company.

It has discovered seventy-six cases among a force of 5,962 men, with 19 additional cases which were regarded as suspicious. The force employed in these mills is foreign born, except for 28 per cent who are Americans. The American trachoma rate was only 0.23 per cent; of Croatians, Servians, Roumanians and Magyars 3 per cent each. The disease, study of the cases has shown, was contracted, with few exceptions, after the men took employment in the plant.

The explanation of the infection was found in the unsanitary lodging houses in which the foreign workmen live, for the report on these places shows eight to twelve men occupying a single room, beds used day and night, no water supply for washing except buckets filled at a pump in the yard, and no health officer in the town but an untrained layman without any funds.

CIVIC REFORMER CHIEF OF SEATTLE'S POLICE

THAT MAYOR GILL of Seattle is in earnest in his announced desire to give a new and completely different meaning to "Gillism" is evident, all kinds of Seattle citizens say, in his first official act, the appointment of Austin E. Griffiths as chief of police.

As THE SURVEY pointed out in its issue for March 28, the very name of Mayor "Hi" Gill was synonymous with the most notorious of wide-open conditions. These so outraged public decency that he was recalled as soon as women received the vote. His election again in the recent campaign was in part due to his acknowledgment that the people want a clean administration and his promise to work toward this end.

Yet even those who credited him with sincerity were quite unprepared for his selection of one of the most vigorous civic reformers in Seattle, the "father of

Seattle's playgrounds," and the "pastors' candidate" against Gill in the last primaries, as chief of police.

Identified with practically every movement for social and civic progress, Mr. Griffiths is the sort of man who, in the words of one of his friends, "would get up in the middle of the night to speak on public welfare." An Englishman, a graduate in law at the University of Michigan, and a plain unassuming citizen, he went to the state of Washington in 1889 and has lived in Seattle since 1897. Among his other activities he served as president of the Playground Association of Seattle. Mrs. Griffiths is president of the local branch of the Congress of Mothers.

Already his work as police chief, which he accepted with much shrinking and personal sacrifice, has led Seattle citizens to foresee a new era in the treatment of offenders against the law. He has suggested a night school for training prisoners and he has asked the Central Council of Social Agencies to appoint a commission to help him in handling the problem of the unemployed.

Mayor Gill's action in appointing Mr. Griffiths, and his declaration that for the sake of his two boys he wants to merit the esteem of the good citizens of Seattle, have unified public sentiment and good-will.

TEN YEARS OF THE WOMAN'S TRADE UNION LEAGUE

ON MAY 4 the New York Woman's Trade Union League will celebrate its tenth anniversary with a mass meeting in Cooper Union. Founded in 1905 by William English Walling and Mary O'Sullivan of Boston, the league has become a familiar factor in the labor movement in New York city.

During this decade the number to whom the league has carried its message of trade solidarity has increased from 10,000 to over 150,000. Twenty-five trades

AUSTIN GRIFFITHS

The "father of Seattle's playgrounds" now at the head of the police force.

are affiliated and two interstate conventions have been held.

In its legislative work, the league has endorsed and, in many instances, actively campaigned for bills in the interest of working men and women. At all times it has shown unswerving devotion to the cause of women rebelling against unjust conditions and demanding a right to a voice in their work.

It was during the great shirtwaist strike in 1909-10 that the league gained an international hearing as the leader of the first militant movement among working women in this country. In that strike the league led the picketing, collected relief funds, bailed strikers, paid fines, published facts, petitioned the mayor for relief from police brutality, organized a parade of 10,000 girls, held mass meetings, and helped make settlements.

Five years later in the white goods strike, and again in the strike of the laundry workers and the straw and Panama hatters, the league rendered the same sort of tireless service. It also led in the movement against a recurrence of the Triangle fire tragedy.

But the quiet everyday work of the

league has been the force that has built up its strength. Six years ago the annual report stated that while the Woman's Trade Union League has been striving for the organization of workers into trade unions it has recognized that the direct work of organization will be done by the women themselves "and that its own work is largely educational." This year for the first time the league is officered entirely by trade union women themselves.

The new president, Melinda Scott, is a hat trimmer. Born in England, she brought to the working women of America the English traditions of organization. Rose Schneiderman, first vice president, is a cap maker. Susie Morgan, second vice president, a book binder, and Alice Bean, secretary, a stenographer.

These officers have the backing of the official trade union movement of New York. Under their leadership the league is setting itself the task of enlisting 100,000 women in trade unions in New York city before the next biennial convention of the National Woman's Trade Union League, to be held in New York in June.

SAFETY AT SEA AND THE CONSUMERS' LEAGUE—BY FLORENCE KELLEY

WHAT HAS the Consumers' League to do with safety at sea, asks the Chamber of Commerce of a leading city on the Great Lakes. The question re-echoes from the Senate chamber of the United States when the senator from that city receives letters asking him not to approve the international treaty now pending before his committee, lest the treaty supersede Senator La Follette's bill for safety at sea.

The answer to the question of the Chamber of Commerce and the senator is obvious. The National Consumers' League counts among its members men and women who travel by sea for business or for pleasure. They remember the *Bourgoyne*, the *Republic*, the *Titanic*, the *Volturno*, the *Monroe*. They prefer not to be drowned.

These members recognize, too, that on shipboard, they are served by stewards and stewardesses, cooks, stokers and seamen, in a far closer human relation than that which they have long acknowledged towards girls who sell them umbrellas and gloves in stores, or men and women who fashion their garments in tailor shops. And members of the Consumers' League accept their responsibility for taking a full share in demanding the common safety. There are, moreover, the thousands of humble fellow passengers who travel by steerage, voiceless and powerless to provide for their own safety.

For all the vast population in transit, the passenger is the natural spokesman. Hitherto he has, however, defaulted. It is

a national and international misfortune that, for twenty years, the struggle for safety has devolved upon the seamen, by reason of the passengers' shirking. Thus the struggle for safety has appeared to be a strife between the seamen's organizations and the shipping companies. In all the long series of hearings upon Senator La Follette's bill in the Senate and House, the writer is the only passenger who has appeared before a committee of Congress to urge the claims of passengers.

Naturally, it is the clauses bearing upon safety which interest the Consumers' League. These clauses resolve themselves into two groups—those having to do with lifeboats, and those relating to seamen. The La Follette bill for safety at sea provides that

"no vessel carrying passengers except those navigating rivers and harbors and the smaller inland lakes, exclusively, shall be permitted to depart from any port of the United States unless she is provided and equipped with a sufficient number of seaworthy life-boats to carry and transport at one time every passenger and every member of the crew licensed to be carried on board such vessel and unless she have a sufficient crew to man each lifeboat with not less than two men of the rating of able seamen or higher, who shall be drilled in the handling and lowering of lifeboats under rules and regulations to be prescribed by the board of supervising inspectors with the approval of the secretary of commerce."

There is clear provision, too, for life-

boat and fire drill [which does not apply to foreign vessels] and for training seamen in abandoning the ship and caring for passengers.

A place in a lifeboat is to be assigned to each passenger at the time of going aboard, and pointed out to the passenger.

Opposition to the bill was centered chiefly upon two provisions, the number and qualifications of seamen and the number of lifeboats. The companies urge that boats could not be lowered in such numbers if there were fire or an extra heavy sea, and that it is folly to require them.

The shipping companies also represent that stewards and stokers can be quickly trained for emergency service, and need no such long experience as that prescribed in paragraph 12. This is the famous provision requiring that three-fourths of the crew must be able to understand the officers' orders, and the deck crew must have a proportion of able seamen beginning immediately with 45 per cent and increasing annually until, after four years, they constitute 65 per cent of the whole deck crew. An able seaman must be nineteen years old and have three years' experience on deck at sea or on the Great Lakes, and these facts must be shown by a certificate issued by a board of local inspectors.

The shipping companies protest that it is impossible to obtain a sufficient supply of such able seamen. Their contention is not convincing, however, because a seaman's career should normally last many years, while one-fourth of every deck crew is permitted, under the bill, to be men in training, and a period of four years is allowed before the full tale of three able seamen in four of the deck crew is required. In view of the hazard incurred by every boat that goes to sea in the interval, this seems to a passenger a generous time allowance!

On the night last October when eleven transatlantic steamships went to the rescue of the survivors of the *Volturno*, the *Kroonland*, on which the writer was a passenger, carried 34 lifeboats and 26 seamen, less than one seaman for a lifeboat. There were approximately 1,700 souls on board. The sea was unspeakably terrible. There was at one moment imminent danger of collision with one of the rescuing steamships. If the threatened collision had occurred, the loss of 136 lives on the *Volturno* must have been far exceeded by the loss on the *Kroonland*. No one who lived through that terrible night can ever be convinced that the safety provisions of Senator La Follette's bill are excessive. Indeed, the report of the general secretary upon that experience suggested the endorsement of Senator La Follette's bill by the National Consumers' League at its annual meeting last November.

Modern Relief in Great Emergencies

Introducing Part I

Ernest P. Bicknell

NATIONAL DIRECTOR, AMERICAN
RED CROSS

EVERY disaster carries over into dependence some who have previously been able to maintain themselves. These may be families of men whose lives the disaster has destroyed, or those with little earning power whose income has been cut off by the destruction of the small properties in which their savings have been invested. They may be those of advanced years who have lost employment because of the disaster and cannot re-adapt their lives to new conditions of work. But whatever the individual story may reveal, the outstanding fact remains that all have been self-supporting members of society. Now, in an hour, they have been swept from their feet. Henceforth they are to be a burden upon society, hopeless, helpless.

A disaster also reduces the level of life in a community by destroying a part of the accumulated assets of the people, by crippling the machinery and interrupting the established processes of production and distribution, and by discouraging and depressing the individual loser who retains his independence at the price of years of struggle and anxiety. A disaster, therefore, increases the burden of dependence which a community must carry and at the same time decreases

the community's burden-bearing capacity.

Superficial study of this subject is enough to show its importance. Recall only a few of the disasters of recent years—the Galveston flood, the San Francisco earthquake and fire, the Messina earthquake, the Monongah, Cherry, Dawson and other mine disasters, the wrecks of the Titanic and the Volturno, the Washington Place fire, the Baltimore fire, the Michigan and Minnesota forest fires, the Mississippi river flood of 1912, the flood in the Ohio and Mississippi rivers, in 1913, the Omaha tornado—with their destruction of thousands of lives, their direct injury to the person or property of more than 1,500,000 men, women and children, and their annihilation of property worth more than \$1,000,000,000.

And though the disasters mentioned are among the greatest, scores of others which have called for the sympathy and help of the people of the United States have occurred within the last twenty-five years, each with an awful toll of destruction.

Continuing necessity for philanthropic

activity in our larger cities has made these places educational centers in which great advances in the scope and methods of social service have occurred in the last generation. Study, experience and publicity have awakened keen interest in measures for preventing and correcting conditions which produce poverty and disease. Social work has gradually become a well-defined profession, and the social worker must be a student of principles and causes as well as an efficient administrator.

During the earlier years of this intensive movement, relief operations following disasters were strangely exempt from its stimulating and progressive influence. This is probably to be accounted for by the fact that disasters are widely separated geographically, and differ greatly in character and extent. No community is likely to suffer from more than one or two great disasters in a life-time, and when these have occurred, all hands have turned out to form a temporary relief organization and get the task over as quickly as possible, with a minimum of attention to the principles involved, or to the comparative value of this method or that, in the restoration of normal conditions and the rehabilitation of individuals. The

method of procedure was somewhat analogous to the old systems of rough-and-ready surgery or dentistry.

It was not until the American Red Cross, after its reorganization in 1905, began systematically to study and direct disaster relief operations that principles and methods applicable to relief work of this character received serious attention. One of the earlier steps which the Red Cross took in the direction of greater efficiency, was the enlistment of strong charity organization societies in the larger cities under an arrangement by which these societies agreed to lend trained social workers to that organization for service in disaster relief.

The Red Cross, with these trained recruits and its existing records of methods and experience, began the accumulation of a body of knowledge to be drawn upon for suggestion or guidance with each new disaster. The consequent increase in efficiency in dealing with large problems of emergency relief has gradually become generally known, with the result that people everywhere have come to expect higher standards in methods of emergency relief administration and more rigid accounting for relief funds.

Directing Relief Operations

The Red Cross is more and more relied upon to direct relief operations. In the twenty-four years between 1881, when the organization was created, and 1905, the Red Cross was called upon to assist in twenty-one disasters; during the nine years between January 1, 1905, and January 1, 1914, it was called into

disaster relief service in sixty instances. During the twenty-four years first mentioned, the Red Cross is said to have received for relief purposes, money and supplies amounting to about \$2,300,000, of which \$300,000 was in cash, while during the nine years ending January 1, 1914, the money and supplies entrusted to it for relief purposes have amounted to over \$12,000,000, of which \$8,500,000 has been cash.

These figures illustrate the growth of an intelligent public interest in all matters of philanthropy and a readiness to respond to a serious attempt to introduce efficiency and accountability into the great field of emergency relief.

No general statement concerning disaster relief is complete which omits reference to the vital part performed by the people of the communities suffering from disaster. On them rests the responsibility for taking the first and instant steps toward rescue and relief. They must act without opportunity for careful consideration or for the preparation of plans of procedure. Though they themselves may have suffered the loss of property or friends, the leaders of the community must lay aside personal considerations and devote themselves unstintingly to the task of saving the lives and property of their fellows. The circumstances attending this work during the first hours following a disaster are of so distracting a character, the distress, confusion and uncertainty are so overwhelming, that I have been surprised, repeatedly, at the effective manner in which

relief committees have been organized and have set about their tasks.

Not alone the first work of relief following a disaster, but a great part of the entire relief administration from beginning to end, must usually fall upon volunteers drawn from the community itself. Representatives of the Red Cross or others experienced in emergency relief work, introduce system in investigation—keeping records and accounts, and laying out and executing plans which have for their purpose provision for each needy family, of the kind and amount of assistance best adapted to meet its particular circumstances. The trained leader gives direction and continuity to the work, conserves the relief funds so as to prevent their exhaustion during the emergency days, in order that a proper proportion may be retained for the time of rehabilitation, and guides operations through the difficult stage of transition from the period of dealing with people *en masse* to the period of dealing with them individually. The success with which all these important steps are carried out, however, depends upon the intelligence and devotion of the volunteers, who must always far exceed in number the experienced administrators.

First Aid Principles

A question often asked is, "What are some of the first steps which a community should take after the occurrence of a great disaster?"

It may be said that the first step in organization, no matter what the nature of the disaster may be, is to form a central committee, to which should be given complete control of all relief operations of whatever character. It is only by the establishment of one center of authority that order can be brought out of confusion and effectiveness take the place of futility. Personal opinions and ambitions must be completely subordinated to centralized direction and responsibility. In order that this central committee may command the respect and confidence of the community, it should be composed of representatives of all the strong philanthropic organizations and of the business, professional and wage-earning elements of the population. If the disaster has affected chiefly people of a single nationality or religion, it is well to give especially generous representation upon the central committee to the class most affected.

A central office or headquarters should be immediately opened, with a sufficient force of assistants and clerks to attend promptly to the great number of demands which will at once pour in. Nothing is more discouraging or more productive of complaint than long delay in obtaining attention or information. Promptness is vital. Quick decision at the risk of occasional error is preferable, in the first hours, to extended deliberation and discussion.

A bureau of records or registration should be established at the very first. The records need not be extensive, but an attempt should be made from the beginning to record the chief facts in regard to every person reported to be in need of help. The name, address, number of members in the family, with their ages, and some principal facts in regard to the losses sustained may be recorded in a moment. It is not unusual for persons without previous experience in such work to feel that the taking of this record is a cause of unjustifiable delay. It is often referred to as "red tape." As a matter of fact, experience has demonstrated that confusion, delay and unintelligent action are an almost invariable result of a failure to make the simple record described, at the first possible opportunity.

The people themselves not only do not resent the request for this information, but anxiously desire to give it. By providing a sufficient number of assistants to take down statements, the delay is scarcely appreciable and the central committee is given a solid groundwork for positive action from the start. These simple preliminary records can be expanded easily later, when the emergency relief period has passed and the time for deliberate consideration of each family's especial needs has arrived.

The central relief committee, though retaining supervision and direction of all relief measures and the control of expenditures, should not fail to take advantage of every man's anxiety and ability to hasten his own re-establishment. Individual initiative and industry should not be repressed, but as far as practicable, should be directed into the most effective channels. As a man's chief interest following a disaster is to restore his home or other property, it is natural that he will exert his maximum of energy and industry in relief operations if he can be set at the rehabilitation of his own affairs. While many men must be employed in relief work which has for its purpose the general welfare, this principle of directing an individual's activities toward his own greatest interest is of extreme importance and should be recognized whenever practicable.

Peculiarities of Disasters

It will be found that the idleness and discontent which often follow the occurrence of a disaster are most likely to occur among those who are unable to get at the work of restoring their own fortunes or those whose losses are of a character which they cannot personally repair. Time drags incredibly for the man whose home and property have been destroyed and who must helplessly await the action of a relief committee. It is not strange that he becomes impatient, nervous and discontented. Give him the

repairing or rebuilding of his own property, provide him with the simple tools and materials necessary, and industry and new hope will quickly take the place of pessimism and complaining.

Beyond these broad general rules and principles, it is obvious that methods which a committee may adopt in one instance may be inapplicable in another. Much depends upon the character of the disaster.

For example, a mine disaster does not destroy the home or property of a man, but destroys the man himself. The problem then becomes one of the proper care of the widow and her children. In the case of a flood, the waters may not subside for a considerable period, and the problem then becomes one of providing a temporary shelter. The people must wait until the water recedes and gives them an opportunity to begin the work of restoration. In the valley of the lower Mississippi river, flood waters subside so slowly, that it is sometimes necessary to provide for the shelter of refugees for several weeks.

IT will be found that idleness and discontent are most likely to occur among those who are unable to get at the work of restoring their own fortunes. Give them the repairing of their own property, and industry and new hope will quickly take the place of pessimism and complaining.

In the case of a cyclone or fire, destruction is quickly accomplished, and the work of clearing away and rebuilding can begin within a few hours. A disaster which not alone destroys a man's home but also takes away his employment, is doubly serious and brings into the work of a relief committee many difficulties and complications.

Every disaster brings its own peculiar problems, for which no ready-made solution is available. In their analysis, and in the discovery of simple and effective solutions for them, the value of the experienced executive is apparent. An incident illustrative of the adaptation of a solution to an unusual problem occurred in connection with the relief following the great storm in Key West, Florida, in 1909. Many of the sufferers from that storm were fishermen, whose loss consisted in the destruction of their boats. This loss entirely deprived them of a means of livelihood. The representative of the Red Cross sent to Key West solved the problem by employing them to rebuild their own boats. They were paid daily wages while employed, and were thus enabled to provide for themselves and families. As

soon as the boats were completed, the daily wages ceased and the fishermen resumed their usual occupation. There is no doubt that the principle involved in this instance is capable of a wider application in emergency relief operations.

Because of steadily increasing demands upon the Red Cross for assistance following disasters and epidemics, and in developing first aid instruction, town and country nursing and other activities, it has become necessary to strengthen its staff and to expand its organization in several directions. The most recent development of this character consists in the increase of the staff of the national director by providing for the appointment of four assistants. The United States has been separated, for administrative purposes, into four parts, to be known as the Atlantic, Central, Mountain and Pacific divisions. One of the new assistants has been assigned to permanent headquarters in each of these sections, with the title director of division.

The Division Directors

Charles Jenkinson has been appointed director of the Atlantic division, with headquarters in the National Director's office in Washington. This division includes all territory east of the Ohio and Mississippi rivers.

The Central division includes the states of Ohio, Michigan, Indiana, Wisconsin, Minnesota, Illinois, Iowa, Missouri, Arkansas and Louisiana. Headquarters for the Central division will be established in Chicago, but a director in that division has not yet been appointed.

The Mountain division consists of the states of Idaho, Montana, North Dakota, South Dakota, Wyoming, Utah, Colorado, Nebraska, Kansas, Oklahoma, New Mexico and Texas. S. Poulterer Morris has been appointed director of the Mountain division, with headquarters in Denver.

The Pacific division includes the states of Washington, Oregon, California, Nevada and Arizona. Charles J. O'Connor has been appointed director of the Pacific division, with headquarters in San Francisco.

The directors of divisions will ordinarily devote themselves to the organization of chapters of the Red Cross in the more important cities and towns, and to the promotion of continuing educational work, which is intended, through instruction in first aid, elementary hygiene, home care of the sick, and nursing in country and town, to reduce the number of accidents in industry and commerce, to minimize their disabling effect, and to improve standards of health, hygiene and sanitation among those to whom these subjects have not been presented in an effective manner. On the occasion of great disasters, the directors of divisions will represent the Red Cross in the organization and direction of relief operations.

HOTEL BUILT BY THE AMERICAN CONSTRUCTION PARTY IN QUEEN ELENA'S MODEL SETTLEMENT

Earthquake Relief Work at Messina and Reggio

ON December 28, 1908, southern Calabria and northeastern Sicily were visited by one of the most disastrous earthquakes of history. Much has been told of its shocking distress; but only those who were on the spot soon after the catastrophe could appreciate the ruin and horror, misery and madness of the first few days in Messina and Reggio.

The shock came at twenty minutes past five in the morning, as the ruined tower clocks mutely testified. Of the poorer classes, who were up and about, comparatively few suffered injury. But Messina had many wealthy residents, and more of them than usual were in town for the holidays. Thousands were killed instantly, buried beneath the ruins of their houses. Some escaped to the streets only to be struck down there or to die of exposure.

A city of 140,000 inhabitants, closely built, with narrow streets, was utterly destroyed in a few minutes. Five-story apartment houses were left a heap of rubbish; scarcely a building in the city escaped uninjured. Perhaps the most striking indication of the utter collapse is that no hint of the disaster reached Rome until nightfall.

How the Italian sailors and soldiers, in spite of their own heavy losses, began at once the rescue, and how relief soon came from all the world has been fully told. Practically every nation helped. France sent a complete hospital train to convey the injured. Germany, with her genius for preparedness, had a complete field hospital of sixty beds, with the necessary staff and abundant extra supplies, all shipped by rail within twenty-four hours. The English organized committees and took a prominent part in the first relief, as well as in the longer continued work of recovery that followed when the emergency had passed. It would be vain to attempt here to do justice to the generosity with which

Reginald R. Belknap

Lieut. Commander U. S. N.

FORMER NAVAL ATTACHÉ AT BERLIN
AND ROME

relief poured in from every side.

Especially from America and Americans the contributions came thick and fast; and it devolved upon Lloyd C. Griscom, our ambassador in Rome, to administer funds rapidly mounting to hundred thousands. From the hasty dispatch of immediate relief, he turned to organize other measures. From the first day, the American women in Rome had been gathering and making garments and collecting supplies of various kinds. These, with as much more as could be purchased, were needed at the front with the least possible delay. But could they be sent with all transportation already taxed to the utmost?

The Expedition

The plan evolved was to charter a ship and fit her out at Civitavecchia, which lies to the northward of Rome but nearby, and so would be clear of the traffic congestion. From there she could go to Messina or elsewhere, as the Italian authorities might indicate. This decision was taken Saturday morning, January 2. Before noon of that day Mr. Griscom had formed the American Relief Committee, and all of its members had set themselves industriously to work. The American Red Cross cabled approval of this plan and adopted the expedition as its own.

The following Monday at 6 p. m., the North German Lloyd steamer Bayern, then in reserve at Genoa, was secured. Consul General Smith at Genoa purchased provisions and supplies for her cargo to the amount of 85,000 lire, or \$17,000; and a report came from him

The cost of this expedition to the American Red Cross was over \$80,000.

Tuesday afternoon, saying that the Bayern would be ready at Civitavecchia, all loaded, Thursday morning. Thursday morning, therefore, the expeditionary party left Rome by special train and at four o'clock that afternoon, seventy hours after chartering the steamer, the Bayern sailed with us for Messina.

The ambassador, Mr. Hooper, Mr. Gay, and myself represented the committee, I being in executive charge of the expedition, Mr. Hooper treasurer, and Mr. Gay in general charge of the supplies. The eleventh day after the earthquake the Bayern arrived. As the situation in Messina was then well in hand, General Mazza, who was in chief command in the whole stricken area, recommended our going to Reggio, Catania, Palermo, and possibly also Syracuse, where there were many refugees and wounded but, so far, little help in proportion to their needs.

The wreck of Reggio was almost as complete as that of Messina; but close proximity to the larger place across the strait had caused it to be all but passed over. The Italian army and navy were, however, accomplishing great things. Captain Cagni had sent four-fifths of his crew of the cruiser Napoli away on relieving expedition, among the cutting small villages and into the mountains; and he wanted our supplies for a second series of these trips. As his eye ran down our list, he showed particular satisfaction over the women's and children's clothing. All his ship's signal flags had gone to make skirts for women. He took also shoes, oil stoves, tent canvas, cooking and table utensils, tools, and nails, besides large quantities of provisions.

Some of our party who went on shore at Reggio reported that groups of mourners were frequently encountered, and that the whole atmosphere was of controlled grief and stern activity. Search parties were still at work, and on the

day of our visit a little girl of seven years was rescued. No one paid any attention, however, to a house dog on the third floor of a half-ruined dwelling. One shot would have ended his misery, but the poor brute was left to run back and forth, howling, now and again preparing to jump, and as often shrinking back. When we returned a few days later, he was gone.

Visiting the Fugitives

At Catania, hundreds of fugitives crowded the city. In one building alone 780 of them were quartered. I shall not soon forget my visit to three hospitals. As we entered one large ward, our guide said "Here all are fracture cases," mostly head and shoulder injuries. In some other rooms, one needed no guide to read the blank look of a lost mind.

The authorities and the townspeople had worked hard and devotedly. It was a gratification to help them, and to be able to turn over to them large quantities of clothing, provisions, medical supplies, and miscellaneous articles to distribute, and a considerable sum in money. A good supply of provisions, clothing, shoes, blankets, medical dressings, and miscellaneous articles was delivered also to a committee of Americans and English that were working in the small towns along the coast just south of Messina, which had suffered severely but were too small to attract relief from outside. By this time it was known that the Bayern's hospital accommodation was not to be used; so all the clean bed linen in the ship was turned over to this committee. We lent them also one of our English nurses; and finally left 10,000 lire in their hands for relief purposes.

At Reggio Captain Cagni had asked if we had any lumber. We had none; but in Catania we bought for him enough for 25 shanties, 13 by 13 feet—all that could be obtained and loaded on board the steamer in one day. To this amount more was added by knocking down the steerage bunks, which would not be needed for refugees. The prefect said that the refugees neither wished to leave Sicily nor did the people and authorities wish to have them go.

Although the Bayern took no refugees from Catania, we were asked and officially authorized to take twenty-four orphan children to Genoa, for delivery there to a committee from the Province of Como. The Little Sisters of the Poor also were glad to avail themselves of the opportunity to send six of their number to Rome. They had either been hurt in the earthquake or were completely worn out by their subsequent exertions. Twelve old men and women were in their charge; and an Italian woman with three children came on board, on her way to join her husband in America.

WORKING ON A GROUP OF HOUSES

Returning northward, we spent two days at Reggio to raft our lumber ashore and deliver four more boat loads of clothing and provisions. That night we spent at Messina again, where we heard of a family rescued from the ruins after eighteen days' imprisonment.

Arriving at Palermo Saturday morning, our consul, Mr. Bishop, arranged to unload our remaining supplies quickly so that we could sail that evening. Holds and storerooms were emptied of everything remaining, including the steerage mattresses. These would furnish beds for 1,200 refugees, who were then sleeping on straw. Finally 30,000 lire were placed with the municipal authorities and the consul. By 7 o'clock nothing disposable was left, and the Bayern sailed away, homeward bound. Next evening, January 17, our party had disembarked from the steamer at Civitavecchia and by 8 o'clock were back in Rome.

Thus, in a tour of ten days we had delivered supplies for six places, amounting to 230,000 lire in kind and 115,500 in money. All was accomplished within fifteen days of the inception of the expedition, and with such quietness that many good people in Rome did not know an expedition was afoot until it had returned and disbanded. It was a dashing enterprise, almost spectacular, and

it made a great impression besides relieving much distress.

That was but one of several undertakings of the American relief committee. Fortunate was it that our ambassador was a man of such energy, ability, and tact. Two expeditions to Calabria (which suffered as much as Sicily, but received less attention in the distribution of foreign relief) were carried off with success and credit to those in charge.

If we are to pass on to the work of rehabilitation, in which America and her navy played an almost unique part, no space can be taken to tell how, without waiting for a congressional appropriation, the Celtic, Commander Huse, a naval supply ship lying in the Brooklyn yard, was loaded and dispatched in four hours after receiving orders, although many of her officers were off on vacations; nor how Admiral Sperry, who at the time of the earthquake was with our fleet in the Red Sea, dispatched two ships to Messina, where they arrived on the same day as the Bayern.

Of the United States government's gift of \$800,000, nearly half a million was devoted to the purchase and shipment of material for building some 3,000 small cottages. The Italian government had requested this, believing that our familiarity with wooden house construction would result in the most satisfactory outlay of that sum of money. This plan was agreed upon about January 15.

Relief Steamers

The navy pay officer in New York at once chartered four tramp steamers to load at New York, and a fifth at New Orleans. The New Orleans steamer and cargo were chartered for the American Red Cross, which contributed \$100,000 for steamer and cargo, afterwards adding \$60,000, which met the cost of

AMERICAN COTTAGES IN THE LEMON GROVE, MESSINA

constructing the cottages. Mr. Mudd, the pay director, had a sketch plan made of a 16 by 20 two-room, one-story cottage. On this he made contracts for about 11,000,000 feet of lumber, and doors, window sash, tools, nails, hardware, glass, roofing paper, wheelbarrows, shovels, picks, axes, fire extinguishers, stationery—all on the basis of constructing 3,000 of these cottages, working at several different places at the same time. The contracts were drawn up and placed in the space of forty-eight hours, yet all needs had been so well provided for that in the course of four months' work only a few supplementary purchases were found to be necessary.

Beginning to Build

Many persons have thought that portable houses were sent over to Italy. Forty-nine of these were donated by the Massachusetts Relief Committee, but it would have taken six months to manufacture 3,000. Moreover, as found in putting the 49 together, damage in handling or unequal exposure to weather made the parts join badly, so that they would not have answered the purpose.

Loading night and day, the British tramp steamer *Eva* was the first to sail, on February 1, with material for 500 houses, and two American carpenters to show how to build them. Meantime, the ambassador had designated me as his representative, to take charge of the distribution and erection of the houses. My instructions were to follow the wishes of the Italian authorities. Lieutenant Alfredo Brofferio was designated as my aide and the navy department lent the assistance of the Celtic temporarily, and the *Scorpion*, Lieut.-Commander Logan.

On Washington's Birthday, the Celtic, carrying the American construction party, moored in Messina. Fifty-six days had passed since the earthquake, forty-five of them cold, rainy days. Business was reviving, and the tide of recovery had begun to flow steadily. Our arrival was timely for quickening it.

The Italian civil engineers showed where we were to build, in a large lemon grove on the outskirts of Messina, one mile from the quay. A thousand houses were to be here, arranged in groups of twelve. Another thousand were to go up in Reggio—600 in the Palmi district, Calabria; 300 in the district between Messina and Tarmina, and 100 in the Queen's model settlement three miles away. Later, the number for Reggio was reduced to 500, and for Messina increased to 1,500.

The task was to convert the cargoes of four steamers into 2,500 standard cottages. The fifth steamer, with material for 500, was turned over intact to the Italian authorities at Naples, her

cargo to be shipped from there by rail to the various points in the Palmi district.

The outlook upon arrival was anything but encouraging. Ruin lay on every hand, clogging the thoroughfares and making passages at many points dangerous. Even the space on the quay for landing our cargoes was limited. The material had to be transported more than a mile over a crooked, difficult route, by slow-moving ox-carts, of capacity infinitesimal compared with the steamer's huge bulk.

At best the workmen were indifferent, little accustomed to American tools or wood-working. Many of them were unused to manual labor of any kind. And no one had the least idea of working quickly. So little was accomplished in the first two days that the task in contemplation looked hopeless. "We'll be here until September," said one. "About June 15," I returned. And though a mere guess, it proved a happy one.

Work began with two American carpenters, two of our own naval carpenters, and a dozen native carpenters and laborers. About thirty American sailors were used as leaders of native gangs, small and large, at various kinds of work in our unique construction party. Lieutenant Buchanan managed the work in Messina, where in eight weeks the force employed grew to over 800, with a weekly payroll of 25,000 lire. In Reggio, Ensign Wilcox was the head of a similar organization of nearly 500.

The Effect of a Bonus

Unloading cargo and carting to the building site were done by contract, but we had to follow it closely. During the first month a sailor accompanied each group of carts, in order to prevent loss by theft and endless delay on the road. The expedient of a copper coin to the driver, 2 cents for each load of lumber delivered on the building site, increased the rate of transportation three-fold. The first aim was to strike in deep quickly, so as to enlist every man's pride and determination to make a creditable outcome; and the second was to make a good showing early in the undertaking in order to give encouragement to our own party.

Only seven American carpenters had been originally engaged in New York; but a cablegram brought nine more within a month. For three weeks we worked at maximum speed, taking on new hands every day to the limit of our increasing ability to manage them. Difference of tongue proved less of a handicap than had been expected. A good many of the Messinese had worked in America, and these flocked to us for employment. Among them were found a few reliable leading men. Several boys too young to work made satisfactory interpreters.

It was not long, however, before our American carpenters found that the most effective way to deal with inefficient working was to jump into the midst of a group and with swift telling strokes of hammer or saw, show how the trick should be turned. After a few weeks the handling of their men by some of these carpenters was masterly. One man managed single handed two hundred men working in fifty separate groups.

176 Houses in One Week

While the first group of twelve houses was building, for the camp, the original plans and framing were studied and altered, so as to eliminate every unnecessary piece of material. Since each piece of wood had two ends to be trimmed, every piece that could be dispensed with from one house meant 2,000 fewer items of work for 1,000 houses, not to mention the considerable saving of labor in handling, and the saving of material itself for other purposes. In this way, except as to roof and flooring, we saved fully 10 per cent. That and other savings, and some extra material sent in the later cargoes, made up enough to build a hospital, two schools, a large work room, a church with monastery attached, and a good sized two-story hotel.

Another modification of the original house plan was the addition of a kitchen. This had a brick floor and two adjoining walls of brick, forming an angle in which was a fireplace with two iron grates, all of native pattern, so that a family would find everything familiar. But for this addition, the American cottages would have been distinctly inferior to those the Italians were building; and doubtless some houses would have been set on fire.

The most difficult part of the work was that of the enclosing gangs, four men to a house. These, therefore, became the pace-makers, and it was thought at first that two houses a week by each enclosing gang would be a good average rate. By gradually increasing the force to fifty enclosing gangs, we might in time build 100 houses a week. Such was the estimate; but after some discussion as to the probable result, a bonus of one lira (20 cents) was declared to every man of an enclosing gang for every house completed. The effect on the building rate was immediate; and instead of only 100 houses a week, there were 176 in the best record week, 174 the next, or 350 in a fortnight in Messina alone. The count for one day was 36 in Messina and 20 in Reggio. This was at the end of April and showed a well-sustained enthusiasm, after nine weeks' labor.

The site selected for Queen Elena's model settlement, called Villaggio Regina Elena, was a small suburban property,

about two miles north of the municipal palace and three miles from the American building zone. Under the leadership of Captain Bignami, a naval constructor, a party of Italian sailors and infantrymen built up a good-sized village, of small wooden houses, two or three stores, various workshops, schools, and a church. The streets were well laid out, lighted, graded, and guttered; there was a small park, with flowers and shrubbery; and provision was made for continued resident control, so that the settlement might really be an example in cleanly and well ordered living.

In accordance with invitation, we built 75 of our houses here; and as a special gift of the American Red Cross, a sanatorium, called the Elizabeth Griscom Hospital, was added. Our best workmanship was done on these buildings, to have them in keeping with the Italian part of the village.

Other and larger buildings were undertaken at the suggestions or with the approval of the Italian authorities—hotel, church, schools, and adjacent buildings, all solid, permanent structures. For this work the natives were not sufficiently skilled, so a request was sent to Switzerland for carpenters. Twenty-seven were sent down.

Outside Messina, Reggio, and Villaggio Regina Elena, we did no extensive work, merely erecting the 49 por-

tables and building a number of model houses for the local workmen to copy. For these places a special design of house was made, the simplest possible; because the native carpenters were unskilled, and in the mountainous localities the transportation problem was a serious one.

Occupying the Houses

Our work being practically finished, it was decided to withdraw our party on June 12. A few days before that, the construction gangs were reorganized, to continue as before, but at a less rapid rate, and under supervision of their own foremen instead of our carpenters. After our main body left, Ensign Spofford stayed on with a few carpenters until July 1, to see the paint and kitchen contracts completed and to tie up other loose ends.

Thus the American work ended. We had built 1,900 cottages, and 12 larger buildings, equivalent in labor and material to 270 cottages more; while other material, enough for 1,000 houses, had been delivered to the Italian authorities, for use at various points. For every day we had been in Messina, counting Sundays, holidays, and days of weather too bad for work, fifteen cottages had been built.

The occupation of the houses began about May 1, 307 in the first fortnight,

more than 800 by June 10. Their assignment for occupancy was in the hands of a local committee appointed by the prefect. Before leaving Messina, we had the satisfaction of seeing many of them filled, by needy families of all degrees of life. I have since learned from time to time of the continued usefulness of the cottages; of the wholesome influence of their orderly arrangement and attractive appearance. The church and the schools are in constant use; the hotel has become the center of the better class of life. But better than all that was the vitality that our enterprise contributed toward the restoration of the city.

The question has often been asked: "Are they grateful?" "Do you think they appreciated it all?" I have never doubted it. The houses speak for themselves. They were accepted with genuine pleasure and satisfaction, by both tenants and officials. What counted most, however, was the spirit in which the work was done. Our steady industry, energy, and cleanly and orderly living made a deep impression. And I think the genuine feeling toward us is well summed up in the parting words of the retiring prefect that "we had dwelt among them like brothers," and had rendered "great support to the cause of public order and tranquility throughout this trying period."

How a Mine Company Helped its Sufferers

THAT adequate compensation for industrial accidents, when they come singly, is justly chargeable to the operating cost of an industry has been accepted by many business men, but a holocaust is usually regarded as calling for community charity, for "disaster relief." Not always, however. The following account tells how a mine company met an explosion that killed ninety-six of its employees, by voluntary applying the principle of a workmen's compensation bill then pending in the state Legislature.

The explosion occurred April 23, 1913, in the Cincinnati mine located in Washington County, Pa., about forty miles south of Pittsburgh. This mine is operated by the Monongahela River Consolidated Coal and Coke Company, a subsidiary of the Pittsburgh Coal Company. The explosion was caused by gas liberated in a coal vein.

Within two days after the explosion the Associated Charities of Pittsburgh, an institutional member of the American Red Cross, had a representative on the field for the purpose of ascertaining whether Red Cross assistance

J. Byron Deacon

GENERAL SECRETARY, ASSOCIATED CHARITIES, PITTSBURGH

were necessary. Scarcely half the bodies of the victims had been recovered.

The representative tried first to learn whether the Pittsburgh Coal Company would pay the dependent survivors the sums due in wages earned by the deceased. The third day following the disaster was pay day. The entire mining force had worked full time between the last pay day and the time of the explosion. The minimum daily wage paid by the company was \$2.62. Sums varying from \$20 to \$35, therefore, had been earned by the deceased miners in this period. The company assured the Red Cross that prompt payment of wages due would be made.

These payments enabled the families to provide for their immediate needs. The company further assumed responsibility for burial of the decedents, limiting the funeral expenses to \$75.

The attitude of the Red Cross toward the company was consistently one of assumption that the company intended

and was prepared to recognize and discharge its full measure of moral responsibility. To what extent this attitude shaped the course pursued by the company can, of course, be only a matter of conjecture. The relations between the two were cordial and helpful throughout.

Shortly after the disaster, Monongahela City, Charleroi, Washington and several small mining villages near the Cincinnati Mine simultaneously formed relief committees and raised funds, in the larger communities by press and pulpit appeals, and in the villages by church collections and house-to-house canvases. Industrial organizations also announced the appropriation of funds for relief. Groups of women representing churches and relief committees visited the afflicted families. At the outset the chief work of these women was the provision of mourning apparel for the bereaved, although in some instances they made cash contributions to the families. They wisely ceased the latter when they found that the company was providing adequately for the families' material needs.

As a result of meetings called on the

initiative of the Red Cross, at which representatives of all parties interested in the relief work were invited to be present, the Cincinnati Mine Relief Committee was formed. This was an informal organization created to co-ordinate the activities of the constituent groups. At the earlier meetings of the committee the Red Cross representative emphasized the fact that the coal company was prepared adequately to care for the temporary needs of the afflicted families and would doubtless make subsequent provision for their continued care. Emphasis was also placed upon the importance of not appearing to assume a responsibility which rested primarily with the coal company and secondarily with the labor organization, with which the miners, apparently without exception, were affiliated.

A week after the explosion two experienced social workers entered the field as agents of the Red Cross. During the next month they obtained comprehensive information respecting the status, resources and needs of the families. This formed the basis of action by the Cincinnati Mine Relief Committee in such incidental relief-giving as was found necessary, and also proved useful to the company.

Of the ninety-six men killed, forty were survived by widows living in villages adjacent to the mine. Thirty-two of these widows had eighty-seven children, all but eight under fourteen years of age. The remaining eight widows were childless. Eleven of the thirteen who reside in Europe are supposed to have one or more children, while two are supposed to be childless. Ten of the decedents were survived by relatives other than widows and children, who are living in the United States; in four instances the relatives were in no-wise dependent for their support upon the earnings of the deceased. Nine of the victims were said to have rela-

tives other than widows and children living in Europe. The remainder passed as single men (immigrants) about whose relatives, if any, it has so far proved impossible to gain information. Thirty-six of the victims were members of lodges which pay benefits in case of death, and fifteen carried life insurance, the policies ranging from \$100 to \$1,000.

The Compensation

The Cincinnati Mine Relief Committee soon resolved itself into a "case conference." It was arranged that no constituent organization should provide material relief in any case until it had been considered by the committee. The Red Cross field workers formed a medium of contact between the relief committee and the afflicted families. The majority of the committee members showed quick appreciation and made intelligent use of modern methods of investigation and treatment employed by the Red Cross workers. Indeed, the experience of the Red Cross representatives persuaded them that in their few weeks' activity they lived through a century's history of the attitude of society toward dependency.

Beginning with the indiscriminate material-relief-giving phase they were led to a perception of the need of the organization of material relief agencies and the co-ordination of these with other social forces and a recognition of the fact that those immaterial forms of sympathetic enlightened personal service are quite as necessary as the giving of material relief. The process completed itself in the full recognition, on the part of the agency primarily concerned, of its responsibility for making provision for the future of the families as a matter of social justice.

Within six weeks after the explosion the Pittsburgh Coal Company proceeded to take releases and to settle with the victims' relatives. The basis of

settlement was substantially as provided in the workman's compensation bill then pending in the Pennsylvania legislature, but which subsequently failed of passage.

Those eligible for compensation were widows and children, or in the absence of both of these, fathers and mothers, or, in their absence, brothers and sisters. The compensation was to continue for 300 weeks, or in the case of full orphans or abandoned children, until such children reached the age of sixteen years. It was to be computed on the basis of the decedent's average weekly earnings, exclusive of overtime, and paid periodically as wages were paid. The childless widow was by the bill allowed 25 per cent of the decedent's wage; the widow with one child, 40 per cent, and so on to a maximum of 60 per cent for the widow with five or more children. In the event of the remarriage of a widow payments ceased. Lump sum settlements were to be made on the basis of the compensation discounted one-third.

The settlements made under these general provisions have involved appropriation by the Pittsburgh Coal Company of sums ranging from \$650 to \$3,600 per family on the pension plan of payment, and from \$350 to \$1,050 on the lump sum basis. The pension payments cover periods of from forty-one to sixty-nine months. The monthly grants amount to from \$8.50 to \$37.50. As between lump sum and pension settlements the division of choice has been about even. The company has used every reasonable effort to effect settlements on the pension plan. The work is now practically completed. A recent canvass of the families by a representative of the Red Cross indicates in virtually every instance a present economic status as favorable as that existing immediately before the mine explosion.

Land Relief for Sea Disaster

W. Frank Persons

DIRECTOR RED CROSS EMERGENCY RELIEF
COMMITTEE, NEW YORK CHARITY
ORGANIZATION SOCIETY

ROMAN JABOULETSKI, eighteen months old, was delivered in health and safety to his parents in Minneapolis by a Red Cross nurse on the tenth of January. This youngster was the last to reach his destination of those who survived the wreck of the S. S. Volturno. On the day of the disaster he was rescued by a ship which carried him and his four brothers and sisters back to Liverpool. His parents, rescued by two different ships, were landed in New York and Philadelphia but speedily reunited. The children did not know whether their parents had been saved

or not, and the parents were equally in doubt concerning the children.

Upon arrival in Liverpool the children were all sent to the offices of the Uranium Steamship Company in Rotterdam, where they had embarked, to await news of their parents. Inquiry by the Red Cross Emergency Relief Committee brought the news of their safety, and immediately arrangements were made to have the children sent on

to New York. Roman, however, became ill with the measles. His sickness was prolonged, and in November his four brothers and sisters were forwarded without him to New York, and thence taken by an attendant to the parents in Minneapolis. When, two months later, Roman was finally placed in the arms of his parents, he failed to recognize them and cried bitterly when separated from the nurse who had cared for him on the last stage of his long journey.

The care given to this infant during his lonely journeys by land and sea is typical of the relief which often fol-

lows shipwreck. It indicates also the sympathy and interest with which those in helpless suffering were treated by the agents of the steamship company and by all others with whom the Red Cross Committee has been associated in this relief work.

Perhaps the most affecting reunion was that of Mr. and Mrs. Valentine Posantz. They had started to the United States in their old age. They were saved from the *Volturno* by different boats. The husband arrived in New York first. His wife was landed at Philadelphia. Each was heartbroken, believing the other dead. They had no friends in this country and no relatives in the old country. It was late in the evening when Mrs. Posantz arrived in New York from Philadelphia. She was taken immediately to the Hebrew Sheltering and Immigrant Aid Society, where her husband was staying. He was told to come downstairs, that a visitor had come to see him on an urgent matter of business. When he was brought face to face with his wife he could hardly believe it was she. The old man and woman were so overjoyed that they could not think of sleep that night and sat up until morning talking over their experiences. Mr. Posantz had work in Nova Scotia. They were provided with transportation, clothing, and a small sum for the purchase of household effects.

Clothes and Shelter

The story of the *Volturno* disaster well illustrates how, in these days of preparation for every kind of emergency relief, the peculiar difficulties of shipwreck are met on land. The *Volturno* burned on Friday, October 10. The disaster became known to the New York newspapers on Saturday afternoon. It was immediately reported to the Red Cross Emergency Relief Committee, and by its chairman brought to the attention of Mayor Kline. An appeal for funds was published the next day.

On Monday afternoon (a holiday) a full meeting of the committee was held. To this had been added four persons whose positions gave them special opportunities to be of assistance. These were the acting commissioner of immigration, the director of the Uranium S. S. Company, the executive secretary of the Council of Jewish Women, and the president of the United Hebrew Charities of New York. The writer was made director and Edna J. Wakefield, assistant director. The former had active charge of the organization of the work. Miss Wakefield, with assistants, had charge of the case work, under the general direction of an advisory committee, which met often to discuss individual cases, each one re-

ceiving full consideration.

There were 562 passengers on the *Volturno*. One hundred and three were lost. Of the 459 who were saved, 347 eventually came to New York on fourteen different ships, and 82 others were landed in Canada. Twenty of the survivors who were landed in Europe returned to their former homes.

The plans for shelter and for other temporary relief were well organized before any of the survivors arrived. The Council of Jewish Women collected new clothing in ample quantity, especially for the women and children. Its trained agents rendered invaluable assistance in locating and establishing the identity of relatives and friends of girls and women, as was necessary before they could safely be sent to their destinations. The Clara de Hirsch Home for Immigrant Girls opened its doors and freely gave the service of experienced workers for the shelter and care of unmarried girls. The Hebrew Sheltering and Immigrant Aid Society received practically all other survivors in its ample and hospitable Home, and willingly and efficiently cared for their temporary needs.

Many other immigrant societies generously offered their accommodations and assistance, as did also St. Vincent's Hospital. Four or five of the survivors were met by relatives who took them at once to their homes.

Twelve ships rescued the survivors, many of whom were first landed in different European ports. Many families were thus separated and widely scattered. The difficulty of securing an accurate list of the passengers, and the greater difficulty of learning who had been lost, became almost at once serious obstacles to plans for permanent relief. Because of their unusual character, the names of the survivors who were taken to Europe were not transmitted to this committee accurately. Many of them indeed seem not to abide by any orthodox orthography.

The wisdom of sheltering the survivors, so far as practicable, in a single place was demonstrated by the greater speed and efficiency with which necessary personal information was obtained, and by the immediate reunion of relatives upon arrival at the first place of shelter in this country. A considerable number of single men were cared for, after their first day on shore, by homes maintained for the care of immigrants of their respective races. In each of these clothing, medical attention and advice, assistance in securing employment, and temporary help of many other kinds were provided.

The survivors were enabled to communicate with their relatives in this country and abroad. They were at once put in touch with those who understood

their language and customs and thus relieved as far as possible from anxiety and uncertainty. Each one was accompanied to his train, given food for his journey, and advised how to find friends or relatives upon arrival at his destination. Messages were sent in advance and matters of transportation so carefully managed that no one of these bewildered people had any difficulty *en route*.

All the ships bearing survivors were met at the dock as they arrived. The inspection by the immigration officials was made on shipboard, and the survivors were taken in automobiles directly to places of shelter. Many of them were obliged to remain in New York for weeks before missing relatives could be found and an appropriate adjustment of their family affairs could be made.

The Cost

Among the 439 survivors who reached America were 53 family groups, 36 single women, and 237 men. A few of the latter had left families in Europe, though the great majority were unmarried. Not a single full orphan, nor a widow, arrived among the survivors. One man, seriously injured by exposure and over-exertion, died of heart disease soon after arrival, leaving a widow and two small children. He received the best of care at the Beth Israel Hospital.

To this family \$2,000 was given from the relief fund; to 41 other families gifts amounting to \$4,034.59 were made. To 35 of the single women \$830 was distributed, and to 61 of the single men, \$1,602.55. The cost of shelter, clothing and other temporary relief was \$1,300, making the total relief expenditures \$9,767.14. The principal loss of property was of clothing and bedding. Many saved what money they had.

The contributions amounted to \$6,513.64. This was increased by an appropriation of \$5,000 from the contingent fund held by the American Red Cross in Washington. Of this a considerable balance remains after deducting the cost of the services rendered. It was decided that it would not be possible to extend relief to the families in Europe of those who had been lost.

The relief appropriations were carefully determined in each case to meet the existing needs. They were not necessarily in proportion to the losses sustained. A large part of this money has been given for disbursement into the hands of other relief agencies in various cities, according to terms stated by the committee, thereby assuring to the Red Cross and the donors to the fund the best possible disposition of the contributions.

Applying Business Methods to Tornado Relief

Edith Grant

HANDLING a tornado relief fund is not included among the ordinary occupations of the business man; but that the task may be done in a businesslike manner is apparent from the experience of Omaha last spring. On the morning following the disaster, an organization came together almost by chance, born, as it were, of necessity. Its efficiency was the more surprising because nobody had been in the cyclone relief business before.

At ten minutes before six on Easter Sunday afternoon, March 23, 1913, after an unseasonably sultry day, Omaha was struck without warning by a tornado, which in a few seconds transformed a well-defined strip of the city, four and a half miles long and from a hundred feet to several blocks wide, from a tranquil, orderly region into one of utter

desolation, ruin and confusion, filled with houses completely or partly destroyed, heaps of bricks, stones and boards, scattered furniture, broken poles and tangled electric wires, overturned vehicles and household effects. The scene was made more appalling by sudden darkness, the shrieks of women and children, the screams and groans of the injured and dying, and those calling for help. Frantic men and women sought other members of their families or tried to rescue those imprisoned under fallen buildings before it was too late. Fire starting in many directions added to the terror.

Close on the heels of the tornado followed torrents of rain. After that came

bitter cold. The rain helped to put out the fires and to prevent a wide-spread conflagration. The cold added to the sufferings of the homeless and of those engaged in rescue work. Streets were impassable for vehicles and dangerous for pedestrians; street-car traffic was stopped; all gas and electricity was cut off and telephonic communication rendered impossible. The rest of the city was unharmed; just this long, narrow strip, passing through both the handsomest and the most thickly settled districts, which the storm chose for its inconceivably swift and furious course, lay in the city's midst, isolated and almost annihilated.

The work of rescue and ministering to the injured proceeded throughout the night. After that the first necessity was the preservation of law and order. The fire and police departments were immediately on the scene. Early Monday morning troops from Fort Omaha and two companies of state militia were sent through the center of the stricken district, and at an appointed time spread out in both directions, expelling all who had no reason for being there, particularly some who might have come to loot. The appearance of the boys in khaki, who could enforce their authority with bullets if necessary, inspired wholesome respect in the lawless and idle. For ten days this part of the city was under military guard.

Card-Indexing the Disaster

At ten o'clock Monday morning Mayor James Dahlman assembled a mass meeting of citizens, and a committee of fifty was at once organized. This body elected an executive committee of seven, but it was soon seen that even seven was too unwieldy a number to act rapidly, and four members of the executive committee were chosen to handle all relief work: C. C. Rosewater, chairman; D. B. Butler, J. M. Guild and E. F. Denison. They at once established headquarters in the Council Chamber of the City Hall, and there remained on duty day and night.

Their two leading principles were, to systematize the work by creating departments, and to fix responsibility and authority.

It was quickly decided that the first indispensable step was to ascertain by means of a census, the extent of the damage, and as far as possible the amount and character of relief needed. A card was devised and printed; and at noon Monday, two hours after the mass meeting, 150 men, who had been reached by telephone, met in the Commercial Club. Maps of the devastated region had meantime been prepared. The district

THE MORNING AFTER THE TORNADO

SIX WEEKS LATER

The northeast corner of Twenty-fourth and Lake streets, Omaha. The photographer stood in the same place for both pictures.

was divided into twenty-eight sections and a captain appointed for each, with five or six men under him. Thus, 125 picked men were out "on the field" by one o'clock, twenty hours after the storm, and were actively at work sizing up the situation, ascertaining the number of homes totally destroyed, or partly damaged, the financial condition of the families, whether the bread-winner was disabled, and what their most urgent necessities were.

Relief Stations

The committee next organized a force of stenographers and accountants, mostly volunteers, who gathered at headquarters Monday night. These office assistants classified and summarized the information contained on the cards as they came in, with the result that by midnight on Monday, the size of the problem was known with reasonable accuracy.

On Monday also the work of organizing the different relief stations and departments was begun. The city health officer was put in charge of the committee on medical aid. Under his supervision came the care of the wounded, distribution of cases among the different hospitals, assignment of medical assistants and nurses, and burying the dead.

The tornado-swept strip was next divided into six districts for the distribution of relief. A station was established in each, usually in a half-wrecked building and always in the very worst part where supplies were actually required. A seventh station was added later in the downtown district.

The relief station managers were autocrats in their districts. The principle in choosing them was to draft able men and fix their responsibility, to lay out broad, though well-defined plans for their respective work, but to leave to each the details of organization. All were \$10,000 a year men, not volunteers, though they served gratuitously. One, for example, was the general superintendent of the city's largest department store, another the manager of one of the principal jobbing houses. To the discriminating choice of these station managers the efficiency of relief distribution, was largely due.

The organization of each station consisted of two doctors, two trained nurses, two or three Red Cross and Associated Charity workers, somebody to keep the accounts and the card system, and from fifteen to thirty volunteer workers and investigators.

They did not wait for people to come to the relief stations but sent investigators out to hunt them up and get a detailed list of their needs. Some people had lost literally everything; others were dazed, and needed somebody to cheer them up and find

their friends. The stations were supplied with all sorts of necessities, flour, potatoes, canned meats, beans—substantial foods which would be both nourishing and easily assimilated. The army ration was used as the standard. Each of the stations handled in the course of twenty days something like \$20,000 worth of food supplies, clothing, and all sorts of miscellaneous articles, such as soap, towels, handkerchiefs, baby clothes, cooking utensils, dishes, cooking stoves, washtubs, tools and furniture.

Very soon sufficient quantities of outer clothes had been contributed, but underclothing was not so frequently given, and hence had to be bought. Also half-ton orders of coal had to be supplied. At first there was demand for overcoats and heavy winter clothing, but in two or three weeks it became warm, and an entirely different character of clothing was needed.

Some people had saved their furniture, but had no way of protecting it. For such cases a section of the auditorium was made a temporary storage place, and the head of one of the transferring companies was put in charge of transporting "homeless furniture."

No money was given under any circumstances. The committee or station heads had none to give. If a family were not able to rent a house, an order was given for one month's rent, and the landlord could cash it. People could get anything they required. If they were ill, orders were issued by station managers on grocery stores for eggs, milk, ice, or on drug stores for medicine. It was possible to make the system very elastic because of the high character and ability of the station manager. He was supreme in his district, and his order was good for anything anywhere. Whatever the relief, however, the committee emphasized the fact that it was simply neighborly assistance, to tide people over a temporary difficulty, not charity.

If a person attempted to get relief from two stations, he was discovered at once. A duplicate record of all relief given during the day came to central headquarters every night, was indexed and a copy sent to every station. Attempted duplications, however, were rare. During the relief operations the Auditorium, with a floor space of 132 by 264 feet, became a vast warehouse, filled with groceries, clothing, and sup-

WHAT THE CITIZENS OF OMAHA THEN DID
Twenty-fourth and Erskine streets, looking north.

plies of every kind which poured in from all sides. Clothing was fumigated, and then sorted as to character, size and condition, so as to be ready for calls from the relief stations. The committee obtained trucks from jobbing houses, breweries and other business places, and organized a system of distribution from the Auditorium to the relief stations, two or three miles from headquarters.

Omaha Self-Sufficient

Charles C. Rosewater, publisher of the *Omaha Bee*, directed the general organization of the work. He originated and executed the plan which formed the groundwork of the campaign—the census taking, the card system, and the idea of centering responsibility in different departments, while focusing the final authority and business management at the headquarters. It was much as if in a few days a concern was created to conduct a business of five million dollars a year; and it was largely due to this thorough and prompt systematizing that chaos was reduced to order so quickly.

In many practical matters the committee had the benefit of the active assistance of Major C. F. Hartman, in command at Fort Omaha, whose knowledge of military organization was most valuable, and of Capt. Stritzinger, a veteran of the San Francisco disaster.

All assistance from the outside was accepted gratefully. The largest single outside contribution to the relief fund was \$50,000, sent by the American Red Cross. It happened, however, that on the day following the Omaha cyclone, a still heavier misfortune befell the people of Dayton and other Ohio cities. Omaha felt that, while its calamity was great, the financial loss was not so large that a self-reliant and prosperous community could not in the main bear its own burdens. The result proved this conclusion correct. On April 20, the citizens' relief fund had reached a total of \$272,560, while the aggregate of relief in all forms was \$1,155,687. At that date the committee had paid out in cash only some \$85,000.

One of the first difficulties to be overcome was getting traffic under headway. It was impossible for the street commissioner to remove the debris fast enough, and so about the middle of the second week the committee worked out a "clean up" on a big scale. A sub-committee got jobbing houses, factories, and other concerns whose men were accustomed to heavy work, to lend them for this purpose. About four thousand of these men, mostly under their own foremen, put in the second Saturday following the tornado, and the Saturday after that, in clearing the streets, sorting out valuable material and piling it up for use in rebuilding. About

half of them worked on Sunday as well.

A committee from the Ministerial Union came to headquarters and objected to the Sabbath being profaned in this way. It was pointed out to them that as the Lord had permitted the tornado to destroy the city on Sunday, it did not seem as if there could be any reasonable objection to using that day to restore it. This volunteer street cleaning work was estimated to have saved the city \$10,000.

The park department put out all their men who understood such work to trim trees. Many were saved who would have been lost had it not been for prompt and skillful treatment.

Although they acted independently of the relief committee the public service corporations were of immense assistance in getting things going quickly. On the day following the tornado, five hundred linemen and other workers were brought to the city to repair the telephone system. Gas, electric and telegraph companies used prompt measures. By Thursday the street cars were running on almost normal schedule.

The Morgue

One memorable incident was the faithful service of the telephone girls at the Lake street exchange on the night of the cyclone. This station, in the very heart of the tornado swept district, was among the few buildings that escaped destruction, although its windows were shattered and the street approaches were strewn with debris. Major Hartman immediately seized upon it as temporary headquarters for his patrol, and likewise as a refuge for the injured and a morgue for the bodies of the dead. The girls on duty that night went to their posts as usual and stuck to their switchboards, in spite of the fact that in one corner of the room, until the undertakers arrived, the gruesome sight of the dead was perhaps little worse than that of the surgeons at work, rendering aid to the injured. Soldiers, who had been at once detailed into regular relief, snatched a brief nap in another corner, and others waiting for their patrol lounged smoking and talking in groups. An artist, looking for realism, could have found nothing more striking.

Rebuilding was the most difficult problem the Relief Committee had to deal with. Nearly 2,200 houses had been damaged and, of these, 752 were destroyed beyond repair. A committee of the Real Estate Exchange furnished a detailed report of the value of each piece of property involved. But much more had to be known. In the words of Mr. Rosewater: "The personal situation of each applicant had a bearing on the case; the age, earning ability of the members of the family, the amount of equity which they held

in the property originally, whether or not they received tornado insurance or assistance other than that rendered by the committee; and some forty or fifty other questions were necessary to be answered in order to act on any case intelligently."

The Apportionment

Day after day the committee sifted out this mass of information, not alone keeping in view the needs of the particular applicant, but determining what was the utmost that could be done for him without infringing upon the just claims of others. After June 4 no new applications were accepted. Then the apportionment began.

The building department of the committee furnished estimates of the amount of damage and cost of repair or rebuilding. The same system was adopted here as in the general relief work, furnishing labor and materials, but not giving the applicant money; only after the completed work had been inspected and certified to by the building department were vouchers issued. A great deal of labor was furnished and expense borne by individuals affected.

The self-reliant and helpful spirit of many—though this is an extreme case—is strikingly illustrated in the reply of an elderly mechanic when he presented his voucher for payment. The treasurer, looking at it, exclaimed, "Why, this is for only half the amount the committee awarded you."

"Yes," said the mechanic, "I know. Wife and I talked it over last night after supper, and we concluded that there were others who would need that money more than we do."

Assistance in repairing and rebuilding was rendered by the committee in 722 cases, the amount averaging \$397, and ranging from \$17.25 to \$1,250.

When the Relief Committee had completed their task they requested that a committee of review be appointed by the committee of fifty to pass upon all their acts from the beginning, and to make an audit of their accounts through a qualified public accountant. This was done, and they were relieved of their duties with a highly complimentary testimonial as to the thoroughness, efficiency and economy of the methods they had followed.

Not a cent had been wasted, not a deserving case had been refused all the relief to which it was entitled. If the members of the committee and their co-workers had been receiving large salaries, or if they had been working in the interest of a profitable concern in which they had a personal stake, they could not have employed more practical business methods, more vigilance, or more "hustle." As it was, they were working neither for glory nor for profit, but solely for the public good.

Why Not Emergency Relief Drills?

WE have fire drills in our schools and factories. Why not emergency relief drills for cities and towns? Why not require every mayor, before entering upon the duties of his office, to think out his course of action in case of disaster? Let us come back to this suggestion after seeing what emergency relief means.

A Mississippi river levee breaks. The waters spread over a wide area. Railroads are overflowed, and trains stopped. Animals, domestic and wild, seek the highest points of land. People move upstairs or into the attic. The waters will remain for weeks and possibly months. Pestilence and famine stare from out the murky tides.

How can relief be given to these people? This is not a problem in mathematics with only one answer.

The first element in the answer is, Do something. The example of decisive action inspires confidence, enlists support, and clarifies the atmosphere.

It is easy to say Do, but what shall be done? Conditions like these show how completely we are creatures of habit. We are born into a world that has certain ways of doing things. We learn our little routine and keep in our own particular rut for a while and then pass on and another fills the rut. When a great catastrophe has shattered the regular modes of action and the civic, economic, and commercial organization is out of gear, it is necessary to devise a plan that will grip the disturbed conditions, establish order in chaos, gradually disentangle the wrecks of property and lives, and save as much of both as possible. In doing this there are certain facts to be kept in mind.

Help Unfailing

The American people will furnish the means necessary to give such emergency relief as will probably be needed by any community in this country. In planning what to do, you can count on that. During the flood of 1912, when the friendly hills of Baton Rouge gave a temporary home to thousands who had fled from the Mississippi bottoms, some of the refugees found it very profitable to go begging from house to house and from store to store as "flood sufferers." When the matter was reported to the relief committee it promptly requested through the press that those in need apply to the relief offices, and that persons found begging on the streets be arrested and dealt with according to the discretion of the city judge.

Some people hold that the firmness of business rules is destructive of the spirit of charity. But professional

R. L. Himes

PROFESSOR OF COMMERCE, LOUISIANA
STATE UNIVERSITY

beggary is no compliment to the charitable spirit of a people. In emergency relief work strict business procedure is wise.

Disaster Publicity

The humanitarian spirit of our people expresses itself most largely through the American Red Cross. Therefore, one of the first things to be done is to tell the American people and the American Red Cross just what you need. To tell the people, tell the press; to tell the Red Cross, wire the national director, Washington, D. C. If the emergency seems to demand it, tell your government by communicating through your congressman and senators.

In giving the people the Red Cross, and the government the facts, do not report mere "hearsay." Get facts. This is difficult to do. Imagination is aflame and every fact is magnified out of all semblance to itself. There will be those who see in the general call for help an opportunity to get more if the tales of distress are made sufficiently harrowing. They come forward with stories of sickness, starvation, and death that, if true, would move the world to give. Investigate. Get facts. Establish the facts in the mouths of two or three witnesses, if possible. Further, arrange at the outset such a system of records as will preserve an accurate history of your relief operations. This record must be absolutely correct regarding cash receipts and disbursements.

Relief work is in none of its elements a money-making business. The occasion for it is the loss of life and property, and the chance of averting further loss. People give money, clothes, food, and services with no thought of gain to themselves, but with an eager desire to save others from crushing loss. Those who handle the charities should be imbued with the spirit of charity. The gift should be magnified in its power for good because it is handled by those whose only desire is to do good to their fellows. When other considerations than these enter the relief councils, beware.

"It is more blessed to give than to receive." A high-spirited man, though in distress, would rather suffer long than receive gifts. Free food and raiment dull the sense of independent thrift. Your relief measures are, therefore, an evil, but the least of the evils before you. Your aim should be to restore quickly the stricken community to self-support.

When the clamor for help was great-

est in one of our floods, a man whose spirit of charity was large, exclaimed that we should have a million dollars to "do for these people what they need."

"Yes," said one of better judgment, "if you had resources enough you would change that population of industrious farmers into a race of professional beggars."

Taking for granted, then, a prompt money response and clear-cut business methods, what needs should we plan to meet?

The requirements of relief will usually fall under the heads of order, health, food, clothing, and housing. These suggest five strong men as needed for chiefs of these departments. For the first, the chief of police, the sheriff, an army officer, or some person with courage and ability, may be selected. For health, organize the doctors into two divisions, sanitary and medical. They know what to do. For willing service in time of need, doctors as a class are unexcelled. For head of the commissary department a merchant who knows the grocery line and is a good organizer will do. Any person of executive ability can handle the clothing department. For housing, secure a resourceful person who can make a quick inventory of the available housing facilities and who can contrive by tentage, temporary sheds, etc., to meet the necessities of the case.

Your Organization

These requirements can best be met by definite organization. First appoint a relief manager or executive officer. Who shall appoint him? The community upon which the work devolves. The mayor may do it. The mayor and council may do it. A mass meeting for the purpose may do it. Do it now. Do not select a man for the job because he "has the time." The man who has the time has, in all probability, none of the other important qualities needed. The man you want is a man of executive ability who has a knowledge of men and affairs.

Having chosen him, call upon your people to co-operate with him in any way he requests. He will at once call to his aid a council of the best men in the community, one to be chief of each of the following offices: dispensation, survey and information, commissary, homes, treasury, sanitation, and medicine.

The chief of dispensation will call to his aid a number of workers to go among the people who need relief. What is needed will be reported to the chief in charge who will order from the proper department. Thus in a few hours people are at work among the needy.

Let it be supposed that the catastrophe

is a great flood. A division of the dispensary committee is out in the flooded area and finds human beings and live-stock crowded on a high spot of ground waiting for relief. It sends word by a swift launch to the nearest 'phone and calls for extra boats. The request goes to the commissary. That chief, we will suppose, has sent out all the boats that could be found. He at once calls for carpenters, sends for materials, and sets to work building flats and other convenient craft for the purpose, and dispatches them to the the scene of rescue.

Another division of the dispensary committee finds some sick people among those brought out of the flooded area. The medical department is called and the sick are taken to a hospital which that chief has already provided. The chief of sanitation calls a committee to his aid and makes a sanitary survey at once and follows it by taking such steps as will meet the emergencies.

I shall not forget the comfort I found in an able and energetic chief of the sanitary department here in Baton Rouge. We had some 7,000 flood refugees in and about this city. That was 30 per cent more than the normal population. A sanitary system good for a city in normal conditions is inadequate for a third more people, and our system

wasn't too good in the first place. I called an energetic, hustling, whole-souled, good common-sense Texan, a Christian minister, and said:

"Parson, what troubles me more than anything else is the sanitary condition of the sections where many of the poorer people among the flood refugees are finding homes. I want a man to go from square to square, from camp to camp, and if need be from lot to lot, and see just what the conditions are. Whenever they are not first-class, hire a squad of men and do whatever is necessary to make them first class. Will you do it?"

He did it. When the emergency was over and the people had gone back to their homes, it was declared by the physicians that there had not been the slightest increase of sickness due to the presence of the flood refugees. It cost money to do it, but the result was worth the price.

It is not necessary to go into further details. The first thing done, there will be little difficulty in finishing the work.

Since no community is exempt from the possibility of catastrophe, the leaders of each community should consider what should be done at once if disaster occurs. This brings us back to the question raised at the outset: Why not

emergency relief drills for communities? They would be of two kinds:

First, a drill in what we should do if our community were stricken. Under this point talk and plan plainly so that if the unlooked-for should happen, the organization will be ready in advance.

Second, what we should do if another community suffered? Using the same organization, take up a collection. Let every person give his mite. Big gifts are good and in the past we could not have done without them. But how fine it would be if the sum total were made up of a great number of small gifts! A penny from each family in this nation would make nearly a quarter of a million dollars.

One of the first things many of us think of is to send "old clothes." I don't like "old clothes." I have seen boxes and boxes, enough to make cars and cars, of them. Some of them are so very, very, *very* old! Pardon me, I would not appear ungrateful. I'm sure those to whom the clothes were given were delighted, and it's quite likely that the very old clothes came from me and my neighbors. But disease and sickness have so many chances for distribution through this medium that I vote against "old clothes" as an emergency relief measure.

Famine Relief in China

Guy W. Sarvis

UNIVERSITY OF NANKING

THERE are many things of special interest to the student of social questions in China at the present time, both in connection with the established institutions of the country and in connection with the transition which is now in process. One of the problems which is as old as the country itself and almost as old as the human race is the famine problem. It may be of interest however to have some account of the actual process of relief as I saw it last year in three different parts of the famine district.

The government of China in the past has been so loose-jointed that the idea of national supervision of the dykes along a great river like the Yangtze seems not to have occurred to the Chinese. On the contrary, responsibility for the maintenance of the dykes both along the large rivers and along the smaller streams and canals (with which the country is covered) is left with the villages and families occupying the land adjacent to the particular sections of the dyke in question. The dyke is therefore as strong as the laziest and most improvident family or the most unenterprising village makes it. In times of flood it is supplemented by a narrow embankment on top of the true dyke, and a wind-storm

means that this flimsy protection will be broken, the waters will begin to pour over the dyke, and in a few hours millions of dollars worth of property will be destroyed and many lives lost. A comparatively small increase in the initial expenditure coupled with centralized supervision of the entire dyke system would have saved all this loss except in times of the most extreme floods when, in the

opinion of Charles D. Jameson, the Red Cross engineer, no human power could control the waters.

Such being the conditions, money given to save the lives of the people who are starving does nothing toward remedying the cause of the suffering. It does save some lives, but the percentage saved is very small, and unfortunately the number degraded into beggary as a result of this sort of charity is very large indeed, if the testimony of missionaries in the afflicted districts may be accepted.

The primary cause of famines in China is floods, but there are several aggravating circumstances (what I am saying applies specifically to the lower Yangtze valley, although it may be true of other regions). In the first place it has been a regular practice of the rice merchants to take advantage of famine periods to get a "corner" on rice and raise the prices until they were prohibitive, so that many of the families who would otherwise have had sufficient means to weather the storm are ruined. They may starve or the daughters may be sold into slavery, or so much of the land may be sold as to make it impossible for the family to make a living in the future.

In the second place such "corners" in the market are the more easily effected

THREE SURVIVORS OF A FAMILY OF THIRTEEN

CHINESE HOUSES IN FLOOD

Because of the totally inadequate means of transportation. In all this region it is almost absolutely true that there are no means of transportation save by boat, wheelbarrow, and men's shoulders. Donkeys are used to some extent, but the wheelbarrow is of limited usefulness. Thus it is entirely possible for hundreds of people to starve from want of food even when they have sufficient wealth to buy food if it could be conveyed to them.

Laborers' Incomes

In the third place the great mass of the people live so very near the verge of starvation that one year of reverse means death to great numbers. Our teachers—men who are really educated and have spent years in obtaining their education, Chinese though it is—receive five dollars gold a month and board themselves and support large families. A working man in the country gets perhaps two to two and a half dollars gold a month and supports a family. This does not mean that there is some alchemy in China by means of which the purchasing power of money is multiplied many fold (although on account of the cheapness of labor it is greater). It really means that the average Chinese lives almost exclusively on very poor rice and coarse vegetables, that he spends almost nothing for clothing and housing and that he has absolutely no luxuries. Laying up for a rainy day is impossible under such conditions, and a crop failure means starvation.

In the fourth place the Chinese officials in probably the majority of cases have no other interest in relieving famine than the necessity of keeping the peace. If some relief is not provided the people will rebel. However, in this very connection it is a notorious fact that relief sent from Peking never reaches, in its entirety, the people for whom it is intended. The official hands through which it passes are all lined with "squeeze." So true is this that the people confidently believe that the missionary gets a big "rake-off" when he distributes relief to them. Last year a physician completely

wore himself out working for and with the famine sufferers, and when he was obliged to return to America for rest, the people said he was going home to spend the money he had made in famine relief work. It is not because the people are ungrateful but because there has been nothing in their past experience to lead them to suppose that anybody would have any motive for disinterested giving. So true is this that many of the missionaries are really skeptical as to the usefulness of famine relief work as a means of gaining influence with the Chinese—although it seems to me this must be a shortsighted view.

I do not make these statements with the intention of harshly criticising the Chinese, for I admire and believe in them, but simply as indicating their point of view about public relief. The same men who would steal the money given to save the lives of their starving countrymen will exhibit a most commendable honesty in business dealing and will be loyal to home and family in a way which probably has no parallel in any part of the world. The fact appears to

be that "squeeze" has become so thoroughly established in China that it does not seem dishonest to the Chinese—if done in moderation!

Some Relief Principles

It is evident from what has been said that the thing most to be desired in connection with famine relief in this country is a removal of the causes of famine in so far as they can be removed. Recognizing this fact, the Central China Famine Relief Committee last year adopted the following principles to govern its work:

(1) That relief be given only in return for work done except in the case of those incapacitated for work, and that as far as possible the workmen be paid in grain rather than with money.

(2) That in the selection of work, preference be given to such work as will help the locality permanently, and as tends to prevent the recurrence of famine conditions, and that each piece be complete in itself.

(3) That no work of reclamation be undertaken which it is possible to induce government officials or land-owners to have done.

(4) That the committee care, so far as lay in its power, for the sick in the famine regions, especially for those whose illness was due to famine.

(5) That the committee bring to the notice of the authorities and if necessary make public the failure of those responsible for carrying on conservation works to fulfill their duty, and that the committee report to the proper authorities any authenticated cases of cornering of grain and other matters of a similar nature.

The first famine region which I visited was above Wuhu, on the Yangtze River, where a very large dyke had been washed out last year and the current of the river

DISTRIBUTING GRAIN TO FAMINE SUFFERERS

A GROUP OF FAMINE SUFFERERS WHO HAVE JUST RECEIVED HELP IN MONEY AT SUCHIEN, CHINA.

had been diverted across the country, threatening to leave Wuhu (which is a flourishing river port) high and dry. One million acres of crops, the normal yield of which is over 500 pounds of rice to the acre, were destroyed in this region last year. Seven thousand people lost their lives in the floods. This does not include those who later died from starvation and disease due to insufficient and improper food.

The chief means of distributing relief in this district was by furnishing work on a larger dyke to replace the one washed out. This work was undertaken on condition that the Chinese gentry agree to finance and superintend a similar dyke further down the river. I visited both dykes and found that the Chinese were doing work far inferior to that superintended by the agents of the famine committee. Rev. Alexander Paul, of the Christian mission in Wuhu, superintended the committee's dyke. The railway engineer stationed at Wuhu gave his services in making the survey, and his Chinese assistant remained to aid Mr. Paul.

"Squeeze"

The history of the efforts of the Chinese to steal the funds of the committee is too long to be written here. From the gentry to the coolies the main interest seemed to be to get as much as possible out of the committee and do as little work in return as the committee would accept. Because of the difficulty of measuring the exact amount of work done in the earlier stages the men were paid a regular ration of rice per day and a very small sum in addition with which to buy vegetables. The first attempt at "squeeze" was in building mat sheds for the workmen. It was necessary to work through head men, as is always true in dealing with large numbers of Chinese. Money was furnished to build a specified number of sheds, each shed consisting of

a certain number of mats. The head men kept a percentage for each shed, making the roofs single instead of double. This was discovered and rectified, but the head men "lost face" and finally got even. The second effort to "squeeze" was made when the men were counted. At first the statements of the head men had to be accepted, but when a count was made, it was discovered that there were several hundred fewer than the 7,000 for whom rations were issued. Finally every man was labeled with the section to which he belonged, the total number of men being divided into groups of fifty each.

Mr. Paul and his assistants then flattered themselves that they had largely overcome the "squeeze pidgin" but later they found themselves mistaken. When the dyke got to the stage where the men could be paid for the amount of work they did instead of by time, it was found that they had been doing only about half work—that is the "squeeze" went to the coolies instead of the head men, the latter being disgruntled because they were deprived of what they considered their legitimate spoil.

The fact of the case is that it is very probable that the work would have been done quite as economically and more quickly if the head men had been paid a lump sum and been allowed to manage their workmen as they pleased and keep a percentage of their wages, which would have been exactly what the workmen would have expected—even though the wages were for famine relief and were under the current rate of wages. Before the work was finished the foreigners came to feel that there was hardly a Chinese on the job whom they could really depend upon to do his work honestly, and this in spite of the fact that the satisfactory completion of the dyke meant salvation for the homes of practically every man there, and in many cases meant actually the saving

of life for himself and for his family.

Finally, word came that since the river had risen it appeared that the Chinese engineer, either intentionally or carelessly, had failed to have the dyke finished to the proper height, and it had been necessary to get a large number of men to return to finish it in order to save it at all. Added to all these troubles was the fact that the foreigners in charge of the work feared that the Chinese officials might tax the ignorant people for the cost of the dyke, although pains were taken to assure them that the money was given and nothing would be asked from them.

Efficacy of Modern Methods

I have barely hinted at the difficulties encountered in the attempts to distribute relief by means of works of conservation which will tend to eliminate famine in the future. This was the first year this method had been adopted in China, so far as I can discover. The old way of distributing free relief was much simpler, although it was heart-breaking because it only touched the fringe of the problem and because it was the "down and out" to whom relief was given in most cases. There was no method of selection which was at all adequate. Under the Famine Relief Committee's method the funds were distributed to the persons most likely to survive and make good citizens, for if a man is willing and able to work at a wage below the market price, he is certainly worthy of relief. It seemed on the surface a heartless method, for it means that the weak and sick would die (for little was done last year in caring for the sick), but I have yet to find the person who was in touch with the actual conditions who did not feel that this method is incomparably superior to the old method. Not only is the relief more effective, but there is a great gain in that the people are not pauperized.

The Chinese have a proverb to the effect that after a man has begged three days he will never work. The actual experience of those engaged in relief works has been that the beggars would rather starve than work. One of the most terrible effects of famines is to produce hundreds of beggars who are a menace to the community both because they are non-producers and because the step from beggars to robbers is not a long one. I talked particularly with the foreign residents of the Huai River valley about the effect of famine on the character of the people, and they agreed that it lowered their moral tone seriously. Famine deprives them of stimulus to thrift and it deprives them of hope. It is significant that after several years of haphazard charity the missionaries and others concerned in the distribution of relief funds have come to the position accepted as a truism by students of phil-

anthropy, that giving something for nothing is almost certain to pauperize the recipient.

The Huai River region is especially interesting because of the peculiar condition of the country which illustrates several facts about China and the Chinese. The Huai River formerly emptied into the ocean through the Yellow River. Sixty-two years ago the latter changed its course so that it empties at present over two hundred miles further north than its old mouth. This indicates how very flat is this whole country. Many years ago it became necessary, in order to save the Grand Canal from being destroyed

by the Yellow River, to raise the dykes along the canal and thus shut off the outlet of the Huai. No provision was made for taking care of the water discharged by the Huai, and the result is that it is literally eating up some of the richest land in the whole country by turning it into a swamp. For hundreds of years now, in fact, since the advent of the Manchu dynasty, nothing has been done to conserve this country—which illustrates the attitude the Manchus have consistently taken with reference to conservation.

The greatest work of the famine committee last year was done in this region.

About fifty miles of dyke were constructed and approximately 200,000 people fed. In order to reclaim this rich region large sums must be spent in dredging, an enterprise far too large for any private company to undertake. The same type of difficulties as those encountered at Wuhu was met here. At least one foreigner died of typhus contracted in the famine district. In fact, it is expected every year that several foreigners will give their lives in this work—and yet the people fail completely to understand their motives, and take it as a matter of course that they are there for selfish reasons.

Catching the Chinese Tiger

Winthrop D. Lane

FLOOD, famine and relief for 2,500 years—a never-ending cycle, unbroken by study of causes or adequate measures of prevention; bits of patchwork here and there to lessen succeeding disasters and perfect willingness to mitigate suffering when it arrived, but nothing effectual to stop the monotony of continuous misery and continuous dole—here is a history about to be ended by what has been called the most gigantic piece of constructive philanthropy since the fabled days of Joseph of Egypt.

In it, American initiative has been the leading string, an American philanthropic agency has held the forward end of that string, and American engineering skill will see the enterprise to its issue.

In those portions of the Chinese provinces of Anhui and Kiangsu which lie north of the Huai river and the Hungtze Lake, south of the province of Shantung and the present bed of the Yellow river, and extending east and west from the sea to the Ke river, lie 30,000 square miles of rich agricultural country. This region has known little rest from floods and subsequent famines for twenty-five centuries. Moulding in its village, city and district archives, are records which tell of the amounts and kinds of relief given to the sufferers. Taxes have been remitted by the government year after year. Millions of dollars have been poured into the region in a generation. Thousands of tons of free grain have been sent in. Dikes and embankments have been built to confine the water, but little or nothing has been done to deepen channels or to furnish means for the free and quick passage of the water to the sea.

"The floods have so increased in frequency and the famines in acuteness," says Charles D. Jameson, an American engineer whose study of this region will be referred to later, "that now over the whole of this area, farmers do not average more than two crops in five years where, if floods were eliminated, the nor-

mal conditions would be two large crops each year. There is small chance for the people to recuperate. Year after year they plant and the crops are lost. Then there comes a year when there is no seed to plant, then no animals with which to plow, then no plows or other farm implements; house furniture follows, sold for food or used for fuel; then two families move into one hut, and the extra hut goes for fuel with which to boil weeds and the bark of trees; this gone, the people steal, murder, beg and often resort to cannibalism, and thus one of the richest agricultural sections of China is in such a condition that

even robbers are becoming discouraged."

To all this an end is now to be put. The rivers are to be trained, all normal floods prevented, thousands of square miles of waste land to be made productive, and hundreds of thousands of people who are little better than paupers are to be given the means of regaining independence and self-respect.

The negotiations which are to make this possible have not been fully completed. The story of their conduct up to the present stage, told by the newspapers only in part, is one of the romances of modern diplomacy. In it one can see the hopes of centuries pressing China forward, in spite of the setbacks of revolution, misery and new floods.

The first step was taken early in 1911 by the American Red Cross. For a number of years this organization had been receiving constant calls for help from the famine district of China. Since 1905 it alone has sent \$577,000 for relief, and nobody knows how many more hundreds of thousands had gone through missionary and other organizations, and from other countries.

A Startling Proposal

Through our state department, therefore, the Red Cross asked the Chinese government if it did not think it would be wise to try to learn what might be done to prevent floods in China. The money which China, following her immemorial necessity, might expect to spend on relief during the next few years, could, it was pointed out, be turned to preventive operations. The Red Cross added that if China thought well of the suggestion it would be glad to send an engineer to make the necessary study and surveys.

Here was a startling proposal. A people who have been called the most conservative in the world were being asked to break loose from a course of action, or rather inaction, centuries old. China was being urged to open her interior to the engineering scrutiny of the West. And the suggestion gained dram-

RESULT OF BARK AND WEEDS AS A DIET

MAP OF THE FLOOD AND FAMINE REGION IN CHINA

This region lies in the great alluvial plain which is still in the making. It comprises 30,000 square miles and is one of the most densely populated parts of the country.

atic force in coming from an organization which had itself helped the continuous stream of money and supplies to pour into her flood region.

Yet China's reply was instant. Her government, then in the hands of the Manchu dynasty, answered that not only would it welcome an engineer selected by the Red Cross, but it would provide him with a corps of assistants, would grant him free transportation and would meet all his expenses. The Red Cross had offered to pay his salary and traveling expenses to and from China.

The reply of the Red Cross was to ask Charles D. Jameson, member of the American Society of Civil Engineers, to make the survey. Mr. Jameson had previously spent sixteen years in China as engineer for that government and in private engineering practice. He knew the country and its people. He consented to make the survey, and arrived in Peking July 16, 1911.

Mr. Jameson went as "American Red Cross engineer to China." He immediately entered upon a reconnaissance of the region in question, being aided by maps of portions of the famine district prepared by the Kiangsu survey students.

These students were the outcome of China's own realization that permanent, curative measures should be taken, and that to evolve a cure for floods an instrumental survey was necessary. This work was inaugurated by Chang Chien, who is now the managing director of the con-

servancy scheme. In 1907 Mr. Chang, not having any Chinese engineers suitable for these surveys, employed a Japanese engineer to teach river surveying to forty young Chinese. The latter have been at work in the famine region three years, and have done excellent work.

The year 1911-12 is known in China for two things. It was the year of the revolution, which began in October, and also the year of one of the worst famines in China's history. The famine had lasted three years. It created a "famine population of two million and a half, one million of whom, conserva-

tively estimated, were starving. To this suffering was added the horrors of civil war, for much of the fighting was done where the famine was worst. Children were offered for sale—or as gifts.

Mr. Jameson, interrupted in his study of flood prevention, turned to relieve the present suffering. Working with the famine relief committee at Shanghai, he helped it devise a method of disaster relief familiar enough in this country, but never before tried in China. This was the expedient of making able-bodied famine sufferers work for their food and shelter. They were set at the job of strengthening the dikes and embankments, with what success Professor Sarvis tells in a preceding article.

After the overthrow of the Manchu dynasty and the setting up of the republic Mr. Jameson completed his preliminary survey. His report was made to the Chinese government and to the Red Cross in October, 1912. Mr. Jameson declared it entirely practicable to prevent the floods that for over 2,500 years have brought misery to China.

During the following year the Red Cross, through the American state department, both during the administration of Mr. Taft and later that of Mr. Wilson, invited the attention of the President of the Republic of China to the manifest importance of action on the report of the American Red Cross engineer. But political machinery had to be put to work and delay was caused.

CHARLES D. JAMESON

VAST FAMINE CAMP OF 500,000 SOULS AT TSINGKIANGPU

In January, 1914, came China's answer, also a startling proposal. She said that she would at once issue bonds to the amount of twenty million dollars to pay for Mr. Jameson's whole scheme of river reclamation, if the Red Cross would assume responsibility for the work and execute it. She kindly offered to wait one year for the Red Cross to accept the offer and make its plans.

The Red Cross is essentially a relief-bringing organization. It has never engaged in engineering projects. So it sent a counter-proposal by cable. It expressed its appreciation of the confidence of the Chinese government and offered to find a reliable engineering firm to do the work.

In less than a week China cabled her acceptance of this counter proposal. The dispatch announced that a commissioner would start at once to make a contract in the country. The commissioner has not yet reached America, but power has been given to K. F. Shah, Chinese minister to Washington, to begin negotiations. When this article was written Mr. Shah, the Red Cross, and the J. G. White Engineering Corporation of New York, were at work on the details of the contract, which will provide for sending a board of engineers to China to report on Mr. Jameson's scheme for disposing of the Chinese bonds and the execution of the work proposed.

Only within the last half century has the western world learned of the destruction, starvation and death which

the millions of people in China's famine district go through every second, third or fourth year. Not till today has it known that such has been the uninterrupted history of this region from the time of legend. The information has come to light from those best of historical sources, local archives written by persons who were witnesses of, and very likely sufferers from, the calamities they described. And just as it was the monks who, through the heedless ignorance of the Middle Ages, preserved much of the ancient literature of Greece and Rome, so it is the Catholic missionaries in China who first made available these rich stores of a people's misery.

Native Documents

Since the early mediaeval period many Jesuits have gone to China for life careers. Living alone in cities of the interior, many have found it an agreeable occupation to pore over ancient records,

translating them into French and sending home the most interesting parts for publication in curious and instructive pamphlets.

It is from these translations that Mr. Jameson and other students of China have become acquainted with town, county and district documents which unfold the long history of China's affliction with floods, her periodic efforts to restrain intractable rivers, and her unending, hopeless efforts to relieve the sufferers. Many of these records go back twenty-five centuries. Mr. Jameson has had a number of missionaries' French versions translated into English. One of these was brought to this country. In it one reads that during the reign of Kang-ki, which lasted sixty-one years, twenty-five floods laid waste that part of China. Sixteen floods marked the reign of Kien Lung, from 1735 to 1798. From 1844 to 1881 thirteen floods occurred.

But these documents, though only fragmentary, go back farther than that. In 1492 a snow fall of fifty days, north of the Huai river, was followed by unprecedented floods. Taxes were remitted and "millions of dollars were appropriated for relief."

In 1569, the Huai and Yellow rivers rose twenty feet, swept away the lake and canal dikes and inundated the entire country to the east of the Grand Canal, carrying away men, animals and houses. Two years later another flood of the Huai killed several thousand sol-

RELIEF WORK AFTER ONE MONTH

DIKE POUNDERS AT WORK

Ten men in a group operate a pounding stone. This stone is circular, a foot in diameter, eight inches thick and weighs about 100 pounds. To each stone are attached ten ropes, and when the men all pull in unison, the stone rises above their heads and comes down with a thud. The dirt is first broken up into clods about the size of a teacup, and every layer of 5 inches in thickness is pounded to the consistency of rubber. To test the layer an iron rod is driven down and into the hole thus made water is poured. If the water does not soak away the layer has been pounded sufficiently.

diers. In 1595, the Huai and Yellow rivers again rose and burst the dikes, again taxes were remitted and several millions appropriated for relief and repairs. These are only some of the more notable disasters, between which occurred many smaller inundations entailing their full share of trouble and suffering.

So little have the causes of these incessant floods been understood, and so apathetic have the people become, that a saying which sprang up along the Yellow river centuries ago has continued to this day: "How would we get paid for catching the tiger if he never escaped!"

To understand the significance of the conservancy work about to be done, and the tremendous effect it will have on the social, economic and moral status of millions of Chinamen, one must look more closely at the flood and famine region and its inhabitants. That district comprises 30,000 square miles of the great alluvial plain of China. This plain is still in the making. Deposits of silt are constantly being added here and there, and rivers change their courses without warning.

The dip of this area is to the southeast, though rivers flow in all directions but west. The country is so flat that except for dikes the highest points are the graves, which in China are often raised to a height of fifteen feet. Standing on a grave one can often look straight to the horizon in every direction.

Roman rulers bound their ancient empire together by strong roads; centuries before Rome was founded, Chinese kings were developing the interior of their

country by canals. In 2500 B. C., when Chinese tradition begins, the great alluvial plain was covered with marshes and shallow lakes, unfit for human habitation. Tradition says that in 2357, the whole plain was submerged by a tremendous flood which lasted 152 years. When the waters departed the entire country was a mass of swamps. Then the great Yu appeared, confined the rivers in their proper courses, drained much of the land and divided it into nine large provinces. This work was completed in eight years and the great Yu retired into private life.

Canal Building

In the years that followed, the country was cut in every direction by small drainage canals made by the people themselves. As the marshes and swamps were reclaimed, the population increased rapidly. This necessitated a continuance of land reclamation, which has been going on almost constantly to the present day, until that part of China has become a land of canals, great and small.

But the efforts of the great Yu and his successors to confine the rivers in their courses, were doomed to slight success. Time and again the dikes have given way like chaff. In the building of this region the dominant factor has been the Yellow river. Like the swishing of a mighty tail, this stream has played over the surface of the plain, changing its mouth hundreds of miles, so that almost no part of the alluvial plain has gone unvisited by it. And every time the mouth has moved, ruinous inundations have fol-

lowed with great loss of life and property.

The most notable change in the Yellow river occurred in 1324. Before that year its search for new channels was largely confined to the country north of Shantung. In 1324, it broke its southern bank near Khai-feng in Honan and swept south, inundating the whole country. For two years it sought a new bed, using alternately the Sha and Ke rivers and the Hungtze lake, until finally it settled into the route shown in the accompanying map by broken lines and marked "the old course of the Yellow river."

Having found this bed, the Yellow river traveled its last hundred miles to the sea through the outlet of the Huai river. But the Yellow was a much larger stream than the Huai. The enormous amounts of silt brought by it raised the bed of the Huai to the height of the Hungtze lake and higher. Floods of the Yellow river consequently backed up into the lake and even west of it, inundating great areas.

To prevent that portion of the Grand Canal south of the Hungtze lake from being broken by the waters of the Yellow river, Chinese engineers raised and thickened the dikes of the latter, facing them with cut stone for a hundred miles. This may have been the right treatment for the Yellow river, but it formed an impassable barrier for the Huai, cutting it off from its former outlet and leaving it to get out of the Hungtze lake as best it could. The result, of course, was tremendous backwater and floods.

But the Yellow river was not yet through with its continent building. In 1854, after 530 years of hard work in the south, it returned to the north of Shantung, 500 miles away, and from that time to this the old bed of the Yellow river has been dry. The floods caused by it have ceased. But the high dike built to restrain it still remains and presents an effective obstacle to the passage of the Huai, so that the floods of the latter stream are as bad as when the Yellow river was its companion in havoc.

But man, as well as nature, has been busy shaping the face of the country. There is hardly a river problem in China that some attempt has not been made to solve. The solutions have for the most part been in the nature of dikes for confinement and canals for drainage and transportation, so that eruptions of the rivers have constantly undone the work of man, and repairs, repairs, repairs have been the history of China's engineering.

Nothing so well shows China's activity in this respect as the Grand Canal, which cuts across the famine region in a north-west route. The first mention of this canal is found in one of the works of Confucius, who says that Wai Kong,

marquis of Lou, in 486 B. C. joined the Yang-tze-kiang and Huai rivers with a series of canals running from one to another of the small lakes between. This artificial water route, which for a time was of great use in provisioning the country, was fed by water flowing north, for at that time the Yang-tze was higher than the Huai. Today the Huai is fifty feet higher than the Yang-tze.

Succeeding dynasties, however, had little time for canalization, one of them being occupied with building the Great Wall. This canal therefore fell into disuse. It was again opened in the third century A. D. and a considerable extension built later by the son of the famous emperor, Wen Ti.

Kubla Khan's Canal Building

When Kubla Khan conquered the country with his Mongols about 1280 A. D. and established his capital at Peking, he required immense quantities of food for his large armies. The main supply, consisting of rice, wheat and other grains, came from the south and was sent in boats or junks by sea. But pirates and storms made the passage precarious and each year many cargoes were lost. Kubla Khan, therefore, decided to continue the Grand Canal from the Huai river to Peking.

This extension, 600 miles long, was designed and executed as a whole. Hundreds of thousands of people were put to work on it. Its entire route was across the alluvial plain. The task was begun in 1289 and completed in three years, establishing continuous water transportation from Hangchow on the south to Peking on the north, a distance of one thousand miles.

But the coming of railways and coasting steamers has done away with the use of this canal for through traffic. The

CASTING WHEAT INTO THE BASKET

round trip by canal takes six months; while the sea trip requires but ten days and that by rail three. Consequently that part of the canal which goes through the Shantung province has fallen into disrepair and can be used only by the smallest boats.

The vicissitudes of the Yellow river and the Grand Canal are but a few among the many factors which determine the living conditions of Chinese in the flood area and affect the problem of prevention. This region is almost wholly agricultural, though walled towns, some of them having 100,000 inhabitants, are scattered through it. Today many of the people own no land whatever, being tenant farmers for well-to-do landlords. Tenants customarily receive half of the produce of their farms, and few are able to cultivate enough to support themselves during a year of scarcity, much less dur-

ing a famine year.

Most of those who are proprietors own tiny farms. These have gradually been reduced in size by the natural increase in population and by the necessity so many are under of selling part of their land in bad years. Large sections of land are being bought up by the rich and tenancy is increasing.

Up to ten years ago this part of the country suffered from increasing overpopulation. So many have died from recent famines, however, and such large numbers have left the locality that Mr. Jameson thinks the population has decreased by almost one-half within a decade. Even those remaining are a heavy drain on the reduced productiveness of the land. Morals have degenerated through suffering and disappointment, until many of the people are not only non-producers but a menace to others.

Such is the normal fertility of the soil that two or three crops a year can be raised when the land is undisturbed by floods. Wheat is planted in the autumn. Early in the following spring millet, peas and other small produce are planted between the rows of wheat. The latter is harvested about the middle of May, and the peas and millet in late summer or autumn. Often a third crop of some other grain is reaped late in the fall.

Destruction by Successive Floods

The floods come at the end of May or in June. Sometimes they arrive early enough to ruin the wheat crop; they always catch the peas and millet. If the flood is heavy it not only ruins what is already planted but stands on the ground until the next planting season and so destroys two and not infrequently three crops. If a flood comes the next year, the people are so discouraged that many simply sit still and die.

These are some of the conditions that flood prevention will change. A million acres of land, now swamps and shallow

PRIMITIVE METHOD OF THRESHING

lakes, will be reclaimed. Seventeen thousand square miles will be made to yield treble the present crops. Three millions of people, and their descendants, will find a new meaning in life.

Since the return of the Yellow river to the north, three smaller streams have been mainly responsible for the floods; the Shu and Yi east of the Grand Canal, and the Huai, running along the southern border of the flood region, draining with its eighty large tributaries most of the territory west of the Grand Canal, and flowing finally into Hungtze lake.

Of these rivers the Huai is the most important. Rising in the distant mountains of Honan and added to by numberless streams, it drains a catchment basin of 70,000 square miles. Both it and its tributaries have well-defined channels, sufficient to handle ordinary floods, as far as the Ke river, which is the western boundary of the famine region. But once the Huai passes the Ke it enters a shallower bed and when it discharges into the Hungtze lake, meets there other rivers from the north and northwest. The Hungtze lake has no visible, adequate outlet and its bed is comparatively high; so the combined volume of water poured into it in a flood season is many times too great for it to hold. Since the southern shores of the Huai and the Hungtze lake are marked by hills, the inundation occurs wholly to the north. Farther and farther back the water is pushed, until sometimes the inundation reaches the old bed of the Yellow river and crosses it.

Deposits of silt have raised the bed of the Hungtze lake many tens of feet and this has caused it to spread out until now its area of 450 square miles is four times as great as its former size. Walled cities originally on its banks have been moved many miles into the interior, and the ruins of some of them can now be seen in the lake at low water.

The Shu and Yi rivers, which cause the floods east of the Grand Canal, are torrential in character. Each has its rise in the deforested mountains of Shantung. The course of the Shu through the alluvial plain is long and winding. After a heavy rainfall in the mountains, where there is nothing to absorb the water, it rushes down the steep incline and in the flat country below finds a channel much silted up, in no way equal to carrying off a torrent. The banks are overflowed and the country becomes a vast shallow lake.

The Yi acts in much the same way. Though ordinarily discharging little water, it is converted by heavy rains into a torrent which tears away the western dike of the Grand Canal (if, indeed, this has been repaired since previous floods) and overflows the country on both sides. The Yi often rises ten or fifteen feet in twelve hours. As its water rushes down the Grand Canal it

eats away the face of the dike, and this silt raises the bed of the canal, which both injures its navigability and makes it less able to carry the flood crest.

The Proposed Measures

If floods are to be prevented suitable outlets must be found for these rivers. The map shows Mr. Jameson's proposed routes for each. It will be necessary also to deepen and train their present channels and to build regulating works.

In addition, canals must be built which will effectively drain the myriad swamps and small lakes now overlying so much of the famine region. The report to the Red Cross locates many of these proposed canals and points out what will be their effects in reclaiming waste land.

Even when this task is completed, China will still have to watch her rivers with vigilant eye. Their beds must be kept free of silt. For this and for maintaining the regulating works, a permanent engineering department must be created. One of the most urgent demands of the conservancy organization, thinks Mr. Jameson, is a weather bureau. At present there are no records of the rainfall in the entire flood area.

And when all this is done China will only have started on her whole problem of conservancy. There is always the possibility that the Yellow river will again break its dike and pour its devastating floods of mud and water over the plain to the south. This stream must be controlled and the Yang-tze must be confined. There are forty to sixty years of flood prevention work in China, says Mr. Jameson.

The cost of the work being planned at present is estimated at \$20,000,000. From a purely financial point of view, it is believed, the results will more than justify this expenditure. The receipts from the million waste acres to be reclaimed can be used in the repayment of the bonds which the government, as already indicated, stands ready to issue, and in addition a small betterment tax can be

safely imposed on the 17,000 square miles of land to be trebled in value. Added to this will be the saving of the annual famine relief.

Before the work be started, however, Mr. Jameson desires that a board of distinguished engineers visit this region and report upon the feasibility of the work proposed by him. This would involve checking the ruling points in surveys already made as to levels, slopes, flood discharge measurements and other items, about four months' work.

If possible this board of engineers will leave for China in May of this year in order to study the 1914 floods, if any occur. It is possible that they may report against the feasibility of comprehensive prevention and the whole affair come to naught. Quite plainly nobody concerned thinks there is much likelihood of this. Even if they should do so, a tremendous impetus would undoubtedly have been given to the more intelligent study by China of her own river problems.

Another development which might lead to the abandonment of the project would be the difficulty in the sale of China's \$20,000,000 worth of bonds, for which the White Corporation is undertaking to find a market. Over this, also, nobody seems pessimistic. It is thought that in view of the withdrawal of this country from participation in the loan which China has recently been negotiating among the powers, United States bankers will be eager to take the bonds.

What lessons flood prevention in China may hold for our own Mississippi valley will be better known when these engineers have completed their work. Already Mr. Jameson's report on China has been made a part of the Senate hearings on Mississippi flood prevention and Mabel T. Boardman, chairman of the National Relief Board of the Red Cross, has given Congress her description of the main features of the Chinese problem. Our suffering from inundations has not as long a history as China's, but it is significant that in one case the national government was induced in three years, by a foreign philanthropic agency, to take a national view of 30,000 square miles of flood territory, and in the other case the national government has failed to take a national view of 1,240,050 square miles of flood territory.

Of the ultimate success of the work in China Mr. Jameson sees no reasonable basis for doubts. Nor does he see only the engineering aspects. "The moral results," he says, "will be the elimination of the suffering, starving and degeneration of several millions of people, who are now fast becoming beggars and robbers; the turning into producers of millions who now are not only non-producers, but are becoming a menace to the country and cause of unrest and lawlessness. The conservancy of this region is a moral necessity for the good name of China."

DISHING OUT RICE TO FAMINE VICTIMS

FLOOD OF THE SANDUSKY RIVER AT FREMONT, OHIO

Part II. The 1913 Floods Their Coming

THROUGH a region mainly agricultural in aspect but occasionally taking on the more grim visage of mining and industrial pursuits, the indolent Ohio River winds its muddy course for hundreds of miles past green hills and yellow bottom lands. As if to set watch over the conduct of the waters, Ohio, Indiana and Illinois on the north, and to some extent West Virginia and Kentucky on the south, have lined the gradually sloping banks, or filled in the little level spaces between hill and river, with frequent unbroken stretches of civilization. Here and there listless, dusty villages, basking in self-sufficiency, remind one of interior rural hamlets whose largest body of water is the stream that flows from the common pump.

Before the twenty-third day of March, 1913, a traveler through this region might have heard awed references to the last great visitation from the silent stream. He would have seen no signs of the devastation—they were removed long ago. He would have discovered no apparent change in the life of the people caused by it. An occasional levee or dike might appear as built needlessly high, but for the most part he would have found people living unconcernedly, close to the usual spring flood line, or in houses propped up on stilts, quite expecting to see the water lap their door steps when the annual rise occurred.

Yet had he been of a curious turn of mind, he might have drawn out one of the older inhabitants to tell him of the tragedy of twenty-seven years ago, perhaps to point to this landmark or that brick on a corner store, where the mounting current had reached its highest point.

If he had been especially fortunate in his choice of a town, he might even have had his gaze directed to a small, weather-worn sign, incredibly high on some public building, bearing the single ominous inscription: 1884.

"It Can't Happen Again"

But if he had inquired why people lived and built property and did business within easy reach of another such visit from the uncertain element, his curiosity might have turned to wonder. He might have been asked if he supposed there could ever again be such a flood as that. He would probably have been reminded that that disaster was now a matter of history and that the people to whom he was talking were living in the present, not the past. And if he had stayed in the locality long enough, he would doubtless have discovered that as far as any observable plan of life gave evidence, the high water mark of 1884 really did represent to many of the residents the maximum to which the Ohio River could aspire. In some way, perhaps through divine decree, perhaps through a law of nature, it had been settled for all time that no flood crest could possibly overpass that record.

This is essentially a true picture of the state of mind of a large number of dwellers along the Ohio River, although many were keenly alert to the first intimation of danger last spring. Much portable property was carried out of reach of the rising waters, but a great deal that might have been saved was lost. It was, of course, simply another exhibition of an age-old human weakness—an overweening security that what

has never happened will not happen. Had there been less reliance on past records, or more on the warnings flashed from weather stations and towns up the river, many a householder and business man would now be better off in the things which make life comfortable.

A different picture was presented along the streams which flow into the Ohio and Lake Erie. There the floods came several days earlier, the rise was more rapid and the currents immeasurably swifter. Where levees suddenly gave way, the rush of waters in many instances overtook runners and vehicles. Even where there were no embankments on which to pin one's hopes, the rise was often so swift that little attempt could be made to save property. There is an authentic story of a woman in Columbus who, knowing that the Scioto was coming up at an alarming rate, but supposing that she would have ample warning if her own situation became perilous, chanced to cast her glance in the direction of the river, and to her horror saw a bank of swirling water coming up the street directly toward her. In her excitement she clasped her baby in one arm and a basket of dust rags in the other, and was just able to reach safety with her burden.

The tragedies of those who did not escape have passed into the histories of their localities. And these tragedies happened chiefly along the smaller, less often flooded streams, the streams with narrow channels which rose in a night and made boats and life preservers as necessary on land as at sea. The Great Miami led in the grim total with a death list of 283, and the Scioto came next

PENNSYLVANIA LINES WEST OF PITTSBURGH IN COMMISSION MARCH 23, 1913

with 134. No other river approached these in the number whom it killed, but several exceeded the slower-moving leviathan to the south.

It was on Monday morning, March 24, that a few newspapers announced the prediction of the weather bureau that abnormal rains would fall over eastern and southern states during the coming week. Those rains had actually begun the day before. By Monday morning, however, few townspeople or farmers along the threatened rivers foresaw unusual danger. To many persons not themselves in the possible paths of floods, the first real sense of impending destruction dawned when a Pennsylvania train, compelled by wash-outs to detour, plunged into the Mad River at West Liberty, Ohio. This occurred at 1:30 Tuesday morning.

But before that, evidence had been accumulating in northwestern Ohio and northeastern Indiana that something more than an ordinary spring run-off was taking place. Not only were a score of lesser creeks in both Ohio and Indiana establishing new flood records, but some of the larger rivers as well were rising with ominous rapidity. There seemed to be little general expectation of widespread disaster. The Omaha tornado of Easter Sunday was still the topic of chief interest.

Throughout Monday the scene of the heaviest rainfall had shifted southward; on Tuesday it spread wide over all of Central Ohio. It was, indeed, during the twenty-four hours from midnight on Monday to midnight on Tuesday that most of the Ohio and Indiana towns not on the Ohio river itself, learned what was to be their fate. Then it was that the nation heard those first frantic calls for help which told of whole cities—Dayton, Hamilton, Columbus, Chillicothe, Peru, and others—foundering like stricken ships at sea. Then, too, began those experiences of individuals, families, neighbors, which mark epochs in the memories of those who went through

them: the grappling with death, the even worse grappling with a despair that held no hope; the strained waiting for release, accompanied by awful uncertainty as to what might be happening in the next block or the next house; the sight of friends or the members of one's own family perishing without a chance for help to reach them. These things the world has read and re-read; they are being woven into the folk-lore of the communities where they occurred.

With the coming of the disaster came that frenzy of the human mind to make its speech rise to the occasion. Unprecedented events, it seems, must be told in unprecedented language; a new experience must have a new tongue. At the outset of the flood that tongue was the tongue of exaggeration. Narrative took short cuts to its meaning, so that in the talk of the hour a building was often "submerged" in two feet of water. Not only were death lists many times too high, but incidents were unduly magnified.

The dead in Piqua, Ohio, were placed at 540; in Peru, Ind., at 500. Ohio herself was described as "one huge sea." Seventy-five residents of Delaware were

reported to have been swept to death by a seven-foot wall of water which surged through the town. The real toll was eighteen. Four hundred children were believed to have been submerged or from building in Dayton. All escaped before the flood came. Water was declared to have reached the third floor of the Algonquin, Dayton's largest hotel. In reality it rose only eleven feet. Fifteen thousand homes in Columbus were believed to have been submerged in from ten to twenty-five feet of water; the subsequent count of the building inspector showed that 4,071 buildings were flooded. Franklin, a village of 2,700 people in the Great Miami valley, was confidently believed to have been swept off the map, only a few of the inhabitants escaping to the single accessible hill. Yet only seven people were drowned and fourteen houses destroyed.

The task of those who came to allay suffering and to meet need was to break through this exaggeration and to get at the kernel of fact beneath. It was piece-work of the most painstaking sort. How it was accomplished—how it may always be accomplished—is told in the succeeding pages by some of those who know best, who were there and who did it. How the state may act in such an emergency—how Governor Cox did act—is told by Mr. Burba, the governor's secretary. Mr. Stein gives the story of the national response and the coming of the Red Cross and the army. Miss Bojesen could not have stayed through those trying weeks without her buoyant sense of humor and faith in folks. Mr. Devine brought to Dayton and Montgomery county his wealth of experience in such crises; Mr. Hubbard carried his to three scattered river communities.

And finally we learn from Mr. Knowles what this worst flood in the new world has amounted to, what the stricken districts have done and may do to prevent, not another rainfall, but another disaster.

PENNSYLVANIA LINES WEST OF PITTSBURGH IN COMMISSION ONE WEEK LATER. PUZZLE: FIND A LINE FOR THROUGH SERVICE

The State's Part in the Emergency

George F. Burba

SECRETARY TO THE GOVERNOR OF OHIO

IN order to understand the full meaning of the relief work performed in Ohio immediately following the flood, one must know something of conditions in the state immediately preceding the flood. Certainly one must understand that never before in the history of the state had anything similar to this disaster occurred. There were not perhaps a dozen individuals in the state who knew from practical experience what would be required in such an emergency.

Drop a handkerchief upon a table, catch it in the center with thumb and forefinger and elevate it slightly, and you have a fair relief map of Ohio. The highest point in the state is near the center. Two rivers carry water into the Great Lakes from the northern half of the state; three rivers convey that which falls on the southern watershed into the Ohio. All five rivers are fed by numerous streams, completely draining every acre of the state. A disaster, such as we had last spring, can happen only when the excessive rainfall is in the very center of the state. When the rainfall is on the southern watershed, the northern part of the state cannot be affected; when the waterfall is heaviest in the north, the southern half is unaffected. But last spring the storms hung for two days over the very source of all five of our rivers, with fairly heavy rains extending to the mouth of each. This rendered relief work the more complicated, for we had no section of the state from which to draw supplies and aid for other sections. Every portion had its own flood problem.

The First Call

Easter morning found Ohio in splendid condition in every way. Mills and factories were all running. Merchants had been and were doing a heavy business. People were engaged in their usual occupations. There was no indication of disaster. The streams were normal. The weather reports indicated local rains.

Rain began falling on Easter Sunday and continued throughout the night and all day Monday. Not an alarm was sent out from any place until some time Monday night. By Tuesday noon the flood was upon us in several localities, and twenty-four hours later had reached its highest point in all the flooded districts save Cincinnati.

The first call for relief received at the governor's office came about ten o'clock Tuesday morning. The little town of Larue managed to get through a call for boats. We had been notified from various sections that the water was rising, that a flood was threatened, that

Copyright by Underwood & Underwood
MILITIA ON GUARD

means of communication were being cut off. But it was not until the cry came from Larue that we fully realized that human lives would have to be saved and that people in considerable numbers would have to be fed.

The problem of rescuing the people of Larue was comparatively easy. A number of boats were available in a summer resort lake forty miles from the town. By means of automobiles and traction lines Governor Cox was able to get these boats from the lake to Larue in time to remove the people from their homes.

But immediately following the call from Larue, came appeals in such numbers and of such tenor that the task of affording relief, became the most gigantic which ever confronted the people of the state. The Legislature was in session and could appropriate money, but other things besides money were needed. Money could not buy that which was most desired.

The First Relief

What might be termed the first real relief measure proposed by Governor Cox was to call out the state troops, some 8,000 husky young fellows, splendidly officered. These men, with supplies, were despatched to the stricken communities under orders to perform whatever might be demanded of them.

To give details of the relief work performed during the hours immediately following the disaster would be to write many reports from many places. Every community presented a different problem

which had to have special handling. No general plan was, or could have been, followed all over the state.

In Columbus, the main portion of the city was not under water, the damage being in what is known as the west side, so that there was left a city of stores and shops and people whose homes were not inundated to take care of the suffering. In Dayton the whole business portion of the town, as well as two-thirds of the residence district, was inundated, leaving no base of supplies and few people who were in a position to render aid. These instances show the variety of problems presented.

But whether one-fourth of a city was stricken, or all of it, every community was without transportation. Trains could not be moved in any direction. In many instances bridges upon the public highways were destroyed, so that the neighboring country could not get supplies to suffering people.

Yet, in the face of all this disaster, it can be truthfully stated that scarcely a human being went without food of some kind more than twenty-four hours, although hundreds of people who were marooned in their homes subsisted upon very small amounts of common-place foods for as much as two or three days.

A State Commission

In practically every stricken community relief committees were at once formed. After the disaster had abated to some extent, it was discovered that a great similarity existed in the formation and in the activities of each of these committees. The people of every community seemed to have done the correct thing. In no instance is it reported that the relief committees were inefficient, or that an improvement could have been made in handling the problems had there been more time for careful consideration.

Governor Cox immediately formed a state relief commission. This Commission, appointed without legal authority, and afterwards recognized by act of legislature, was deemed by the Red Cross the proper body to co-operate with it in the tremendous work to be performed following the flood.

As early as Monday noon the Red Cross was in communication with the Governor, tendering its good offices, but some days passed before officers of the organization were able to reach the various stricken communities or to formulate a plan of relief for the entire state.

In Columbus, the relief work was comparatively simple. On the west side were two large state institutions with ample resources to care temporarily for thousands of people. Flood sufferers were

FLOOD SCENES AT HAMILTON, OHIO

NOT ALL LARGE BUILDINGS WERE SPARED

TYPICAL FLOOD DESTRUCTION, HAMILTON, OHIO

A QUIET SIDE STREET IN HAMILTON

hurried thither where they were given food and shelter. People east of the inundated section formed a relief committee and prepared school houses and churches for relief work. Food and clothing were distributed through various church and social organizations, and hundreds of people who had been driven out of their homes were taken into private houses in other portions of the city. The work of rescuing people from houses in the flooded district was directed by the militia and the director of public safety.

Section Committees

In Dayton, at least four separate citizens' relief committees had to be organized as there was no intercommunication between the south, north and west portions of the city. The most important of these committees, by reason of its resources and the number of people cared for, had its headquarters at the factory of the National Cash Register Company. The plant of the register company, covering many acres, was thrown open to the refugees and temporary hospitals were provided. A maternity hospital was established in the main office building where, on Tuesday and Wednesday, five or six children were born.

All the bakeries in the city had been put out of business, so that the first pressing need was for bread. Fifteen or twenty miles from Dayton is a large orphans' home and a school. These were used to supply bread to Dayton, and Springfield, twenty-five miles away, also supplied large quantities of bread and other food. These were got into Dayton at first by automobiles.

Summary

One million and twelve thousand people lived in the flooded cities and towns. After the waters had subsided, 428 bodies were recovered, and probably half as many more were never found; 20,000 houses were absolutely destroyed within twenty-four hours; 35,000 homes were damaged in the same length of time. The property loss was easily \$300,000,000. During the first few days of the disaster, 220,000 people had to be fed.¹

But 220,000 represents only those who had to be fed because all their food supplies and means of preparing food were destroyed. It does not include the hundreds of thousands who had money to buy food but were hard pressed to obtain it.

We do not expect another such disaster. But if a similar one should befall us tomorrow, we could do no better work than we did last spring, and could hope for no better results than followed the heroic efforts of those who were in position to aid.

¹ The writer's statistics refer only to the state of Ohio.

Administering a Relief Fund at the Top

DESTRUCTION, suffering and heroic rescue form by far the greater part of the accounts of disasters served up in the daily press and magazines. Less conspicuous, but perhaps next in volume, come local relief operations, the restoring of individual families to normal life, the repairing and refurnishing of houses, the re-establishment of small business concerns. Not so frequently remarked upon, but also of interest and importance, are the major plans for carrying on this relief, the co-operative relations which make speed and harmony possible, and the policies which control the distribution of aid. The overhead administration, no less than the other features of disaster relief, has its own romance.

Immediately upon ascertaining the extent of the Ohio Valley floods of last year, President Wilson issued an appeal for money and supplies to be expended through the American Red Cross. To facilitate a wise distribution of relief and to afford a careful supervision thereof it was deemed necessary to establish within the stricken zone a temporary relief headquarters of the Red Cross; and as Ohio, of all the states affected, was most seriously injured, Columbus was selected as the strategical point from which operations should be directed.

Owing to disrupted transportation facilities Ernest P. Bicknell, national director of the Red Cross, arrived at Columbus only on March 28, followed on April 2 by his assistant from Washington.

On March 25, Gov. James M. Cox appealed for funds and supplies to be sent to a group of men designated as the Ohio Flood Relief Commission, the appointment of which Mr. Burba has described in another article.

The Arrival

Upon arrival of the Red Cross at Columbus the treasurer of the commission was found to have established an office into which were pouring hundreds of money contributions; the freight yards were becoming congested with relief supplies, which were being distributed throughout the state by the quartermaster's department of the Ohio National Guard under Col. Edward T. Miller, and the sanitary conditions of the flooded section were being improved by the medical corps of the National Guard under Lieutenant-Colonel Joseph A. Hall. Local committees had been or were being formed in the affected towns to care for the emergent needs of the flood sufferers. Substantially similar measures were adopted in the other inundated states. Simultaneously the quartermaster corps of the United States

Lewis E. Stein

OF THE AMERICAN RED CROSS

NEW RED CROSS COTTAGE TO REPLACE DEMOLISHED HOUSE

army began an active distribution of supplies along the Ohio river and its tributaries.

On April 1, the Red Cross had received in cash \$800,000, and for the next four or five days this fund grew at the rate of \$100,000 per day. The Ohio Legislature appropriated \$250,000 and the governors of all affected states were also receiving relief funds.

At its first meeting the Ohio Flood Relief Commission requested the Red Cross to take charge of relief measures in Ohio, and at the suggestion of Mr. Bicknell, the funds of the commission and those of the Red Cross, appropriated for expenditure in Ohio, were consolidated. Thus was formed the Red Cross Ohio Flood Relief Commission, which immediately appointed the na-

tional director of the Red Cross as its agent to carry on the work of relief in accordance with Red Cross principles. This appointment carried with it authority over all funds in the treasury of the commission. A firm of certified public accountants was employed to maintain a continuous audit during the progress of the work.

The first necessity which forced itself upon those at headquarters was that of expert leaders. Edward T. Devine of New York, Eugene T. Lies of Chicago and C. M. Hubbard of St. Louis had gone to Dayton immediately after the flood; James F. Jackson of Cleveland and Sherman C. Kingsley of Chicago proceeded to Columbus. Francis H. McLean had gone to Hamilton on the *Washington Post's* special train.

Demand for Leaders

All these veterans had been instant in responding to the Red Cross call. But the cry was still for expert help and more of it, and from New York, Boston, Buffalo, Philadelphia, Baltimore, Washington, Chicago, Denver, St. Louis, Detroit, Toledo and other points they came—many from charity organization societies composing the institutional membership of the Red Cross, and others from organizations not directly connected with the Red Cross. These leaders in social work were assigned as special representatives of the Red Cross in the larger towns, several being attached at different times to headquarters to make numerous trips for the purpose of studying and reporting upon smaller towns

ANOTHER FORM OF PERMANENT RELIEF: REPAIRING DAMAGED HOUSES

CLEANING UP IN DAYTON

and farming communities.

Up to this time local committees were looking after the emergent needs of their people. The quartermaster's department of the Ohio National Guard was distributing food, clothing, tents, street cleaning implements and lime by the carload, and these supplies were being supplemented by direct shipments to the affected towns from the outside.

The United States army being one of the first of outside agencies to arrive upon the scene, Major James E. Normoyle, of the quartermaster corps, opened on March 26 an office in Columbus and gathered there 300,000 rations, 3,100 tents, 20,000 cots, 5,000 stoves, 20,000 blankets, and a large quantity of sanitary supplies. Working with the regularity of a clock, Major Normoyle and his assistants handled the emergent necessities of the occasion as if they were playing a game with the moves already planned out beforehand.

Racing the Flood Crest

On March 31, finding that the center of activities was moving somewhat southward, Major Normoyle went to Cincinnati, leaving Captain Hardin Olin, of the Columbus Barracks, in charge of the Columbus office. As the crest of the flood swept on, Major Normoyle kept pace with it, preparing in advance for those things which he was sure would occur. With the assistance of men from the navy and from the marine corps the army established supply bases at various points along the river and stocked boats as floating bases to ride upon the flood waters to those who were in the path of the disaster.

While the quartermaster departments of the Ohio National Guard and of the army were busy in one direction, the State Board of Health, the local health officials, the army medical corps, and the medical corps of the Ohio Guard were equally busy in another. The army sent a field hospital, manned by proper officers and sixty hospital corps men. The entire medical and hos-

pital personnel of the state was on duty for a long period and it was due to the close and friendly co-operation which existed between this organization, the medical service of the army, and the various state and local health authorities, that so little illness developed.

Fighting Disease

For the first month and a half after the flood, Colonel Hall worked night and day, to prevent the great epidemics in Ohio which, without these careful preventive measures, would surely have occurred. In most of the larger places, it was the medical corps of the National Guard which prepared, and insisted upon the observation of, rules governing the boiling of water, the cleaning of homes, streets and yards, the installation and care of sanitary equipment, the burning of drowned horses, dogs, cats and chickens, the destruction of contaminated meats and vegetables, the cleaning of wells and cisterns, and so on.

In addition to these duties, it devolved upon members of the medical and hospital corps of the guard to rescue the drowning, recover the dead, feed the hungry, clothe the naked, and nurse the sick. The last task included attendance upon persons having diphtheria, cerebrospinal meningitis, smallpox, typhoid fever, mumps, measles, whooping-cough, varicella and other diseases, as well as several cases of child-birth.

It was early in these activities that the Red Cross representatives arrived, during a period of from one day to one week after the flood, in time to lend their assistance in bringing the emergency work to a close, and, without a jar, to introduce the sufferers from the flood to the next step in their rehabilitation. During the early days the Red Cross furnished record cards for the taking of a census of those requiring assistance, and the result of this census as shown on the cards was the basis upon which subsequent and permanent aid was rendered.

Great uncertainty existed in the early days as to the amount of relief funds to be available; but as the emergency period was drawing to a close, it was imperatively necessary that a system of rehabilitation relief be adopted at once. Any system entered upon, it was felt, ought to assure justice to the beneficiary and protection to the funds contributed for relief; to aid the sufferer in regaining his former estate, but not to deprive him of his self-respect or his willingness to support himself; and to encourage rather than destroy local initiative in the re-establishment of ordinary living routine. Every community was expected to meet its own need to the fullest extent of its resources.

The friendship and co-operation of local committees were highly essential to the success of this scheme. No matter how skilled in relief work one may be, he cannot go into a strange community and, on the facts as given him by the individual applicant alone make a proper distribution of relief. The representatives of the Red Cross were cordially received by local committees, and were glad to avail themselves of the latter's knowledge of local conditions and resources, and their willingness to share responsibility and criticism. No exact standard of relief can be set for residents of different localities affected by the same calamity, and here again the knowledge of the local committee as to the needs of its people and their standard of living is a valuable asset to a relief administrator.

Because of the uncertainty as to the amount of the relief fund to be ultimately available, and in order to furnish opportunity to those able and willing to help themselves, a progressive scheme of permanent relief, if it may be so called, was adopted. With the family as a unit and need alone as a gauge, the first step in the rehabilitation plan contemplated supplying to all flood sufferers whose homes were habitable enough furniture to provide simple comfort.

Building Operations

When it seemed that further extensive furniture rehabilitation would not be needed, the second step, which provided for the repair and rebuilding of homes, was entered upon. Only those owning the dwellings in which they resided were entitled to this aid, although to this rule there had to be exceptions as there were to nearly every other regulation governing relief operations. Chimneys were rebuilt, porches replaced, foundations repaired, houses put back on foundations and replastered, etc., generally under contracts made by committees. In instances where such action was justified, cash grants for the purposes mentioned were made to owners. In the smaller cities and towns and in outlying communities two and three

room houses were erected on lots from which the homes had been entirely carried away. In other sections, house patterns, consisting of all material necessary for building, were furnished. Typical instances of these operations and many others are given in accompanying articles in this issue.

The third step in the plan contemplated making grants to those families whose wage-earners were drowned. There were not many of these and no one grant exceeded \$1,500. These grants were generally placed in the hands of trustees under an agreement to pay a certain portion thereof, at stated intervals, to the beneficiaries. Where the latter were exceptionally capable and careful the money was paid to them direct.

When it became apparent that as far as practicable, provision had been made for needy families the fourth and final step in the plan was entered upon, namely, the rehabilitation of small business. The funds so paid to business men did more than any other one thing to restore the community as a whole to a normal state. These grants ran from a few dollars to \$750, with one or two going beyond that figure. A merchant, to be entitled to a business rehabilitation grant, was compelled to prove that his equities in real or personal property did not total \$2,000. Under this arrangement sewing machines were furnished to seamstresses, tools to blacksmiths, plumbers, carpenters, farmers, etc.; horses and wagons to teamsters; grain and lumber to mills; stocks to grocery and dry-goods stores; books to school teachers and so on.

But after all this had been done there still remained rough spots, caused by inequalities of relief distribution or the omission of families because of the belief that they would weather the storm

A HORSE HANGING IN WRECKAGE IN DAYTON

without additional assistance. In certain localities where cash grants had been made early in the distribution, refugees had been able to secure some small comforts, but from the majority of homes these were absent, and as relief contributions had been received in more generous measure than could be anticipated in the earlier stages of the work, funds were placed at the command of the local committees for the purpose of making in cash what were known as "final grants." With this money housewives were enabled to purchase clocks, curtains, rugs, or other conveniences or necessities, so dear to a woman's heart.

The treasurer of the local committee was generally accepted as the local treasurer of Red Cross relief funds, and money was advanced him in lump sums upon approval of the national director. In Ohio a voucher check form was adopted for use of treasurers in expending relief funds. This form required

the approval of the Red Cross representative, the signature of the local treasurer, and signature of the payee.

Large sums were used in the payment of bills incurred for the purchase of emergency supplies during the early days. Then, too, large stocks of goods which were confiscated by the National Guard had to be paid for. Up to January 15, 1914, \$127,124.29 had been paid out in settlement of these claims alone.

Of the many questions asked concerning the application of this relief plan, the one propounded most often was, "How did you begin?" It is difficult to answer succinctly. By the time the representatives of the Red Cross arrived on the ground, the lowlands of the Ohio valley had been submerged and frantic calls for help were coming from all directions. Advantage was taken of press dispatches, and reports made by those accompanying the Flood Commission on its early tours of inspection were eagerly garnered and tabulated.

Governor Cox was being appealed to from all parts of the flooded section by telegraph, telephone, and messenger. His office referred all such appeals to relief headquarters. Colonel Hall, surgeon-general of the state, furnished copies of all messages received from his officers in the field. Red Cross representatives, as soon as placed, would immediately report to headquarters any information secured concerning needs in communities adjacent to their stations. As the hundreds of reports came in they were recorded and classified. Names of towns, their population, the number of persons reported drowned, number of houses flooded and destroyed, number of families affected, probable number who would require rehabilitation relief, and the names of those composing the local relief committees or temporarily in charge of relief work were entered in alphabetical order on large sheets.

But those at headquarters were not satisfied to wait for appeals. They adopted an aggressive campaign. Maps were keenly scanned for towns in the

WHEN THE WATERS WENT DOWN

path of the flood and as fast as their names were ascertained, a message offering aid would go over the wires to the mayor. For a time each record sheet was out of date three hours after it was begun.

The night and early morning hours were devoted to receiving long distance telephone reports from the men in the field. They in turn were advised as to the increasing funds on hand, progress in the relief plans, how other men in other sections were solving the problems confronting them, etc.

In order to keep the interest of the public alive and assure the largest possible relief fund, nightly reports were made by wire to agents in the larger

eastern cities, and H. Wirt Steele of Baltimore, for two months assisting the national director at Columbus, carried on a general publicity campaign, illustrating with stories of individual families just what constituted proper measures of rehabilitation relief.

Success

The success of the work was largely due to one thing, co-operation. Too much cannot be said of the loyalty of most of the workers; of the facilities placed at the disposal of the Red Cross by the railroads, the express companies, the telegraph and telephone companies; of the self-sacrificing labor performed by the members of local committees in

behalf of their less fortunate or, in some instances, equally unfortunate neighbors; of the assistance of many other men and women who contributed of their time and strength toward the alleviation of suffering among the stricken; and of the hearty and intelligent support of the press.

Without this great outpouring of cordial, spontaneous effort, it would have been impossible for the Red Cross, or any organization, to restore properly and promptly to approximate normality all those things pertaining to the home life and the business of flood sufferers which were whirled into confusion and chaos by the muddy torrents of this great flood.

Bringing Relief to Scattered Communities

C. M. Hubbard

IN CHARGE OF FLOOD RELIEF FOR THE
RED CROSS ON SECTIONS OF THE OHIO,
WABASH AND MISSISSIPPI RIVERS

YOU might not be impressed by the statement that during the flood of March and April, 1913, the lower Wabash River rose four feet above the previous high-water mark of 1884, but wouldn't you open your eyes if you were told that water reached every house but two in a township of 75 square miles on the Indiana side? Or that it was possible at one time to enter every post office in Gallatin county, on the Illinois side, in a boat?

The territory extending 40 miles along the Wabash and 120 miles along the Ohio, shown in the accompanying map, is occupied largely by tenant farmers, to whom the flood of last year caused the greatest damage in their history. Nearly all of them were heavily in debt. Their mortgage and other indebtedness generally equalled and often excelled the value of their entire possessions. In answer to the question whether these intelligent hard-working men were not the victims of an economic condition that kept them perpetually in debt and gave them no promise for the future, it was explained that they had suffered from crop failures and a series of flood disasters, all of which were exceptional, and that under ordinary conditions they were prosperous.

Bringing relief to the scattered communities in this territory was a very different matter from bringing it to the packed inhabitants of a large city. It was impossible to establish a central headquarters downtown and to direct all operations from there.

The quickest possible action was necessary in order that the thousands who were being cared for in refugee camps and fed by emergency rations of the United States army and state authorities, should have the necessary help to re-establish themselves in their homes and put in crops as soon as the water had gone down. It was already time for plowing

and delay would mean late crops and danger from early frosts.

The first thing necessary was registration of the losses and the needs—especially the latter. For this, there were already at hand, in each community, citizens' relief committees made up of citizens, who were not only willing but anxious to help. An assistant, C. L. Gurney, was called from St. Louis and by using trains, trolley cars, steamboats and motor boats, the different points were visited and registration was well under way in a week.

Traveling involved the novel experience of going across country in a river steamboat, past trees and wrecked houses, when only a skillful pilot could locate the course of the river. The

swiftly running current ranging from twenty to sixty miles in width, with the huge waves that sometimes prevailed, was very like a sea. On one occasion when it was necessary to ascend a tributary of the main stream, some time was spent in finding the course, as the rushing torrent that poured out from every opening between the tall trees, looked like the mouth of a river.

Shawneetown, Ill., Uniontown and Caseyville, Ky., and Grandview, Ind., were inundated and suffered appalling damage, but the other points—Mt. Vernon, New Harmony, Griffin, Crawleyville, Evansville, Rockport and Eureka, Ind., New Haven, Junction, Equality, Carmi, Maunie and Elizabethtown, Ill., and Birds Point, Crosno and Wolf Island, Mo.—were simply centers for the registration of tenant farmers and day laborers in the adjacent flooded agricultural districts.

The registration progressed rapidly

THE PROBLEM OF RELIEVING SCATTERED COMMUNITIES

ALL THESE PEOPLE LIVED IN THREE ROOMS AND A KITCHEN FOR A WEEK UNTIL TENTS WERE BOUGHT

all along the line. The Red Cross representatives reviewed each record in detail with the local committees and decided upon a fair apportionment of relief.

The committees had to be made to understand that relief was in no sense to be a percentage of losses, but a means of enabling the sufferer to resume his usual occupation; that a large loser might receive nothing, while he who suffered but little might have the greater part of his loss restored. It depended upon the man's ability to help himself, and this was determined by the resources that he had left at his command. The committees were for the most part made up of the biggest, broadest minded men of the communities and they quickly saw the point. On one occasion, a committee that had had some experience, reviewed a number of registration cards in the absence of the Red Cross representative and did their work so conscientiously and conservatively that it was found advisable later to increase some of their apportionments.

It was a rule that only the minimum help required should be given. A few exceptions were made in favor of those who had made sacrifices, like the fisherman on the Wabash who owned a good motor boat, with which he could have saved his valuable nets and other

equipment, but who refused to look after his property as long as white flags of distress from inundated farm houses indicated that there were human lives in danger.

Prompt Action

By working day and night, including Sunday, registration and reviewing of cases with the local committees progressed so rapidly that the first requisitions upon the Red Cross for relief funds were made in two weeks and by the end of April, registration was practically complete and the greater portion of relief orders issued throughout the entire district. The farmers thus procured the help they needed by the time it was possible to resume their work.

Through an arrangement between Governor Ralston of Indiana and the national director of the Red Cross, it was agreed, after the registration had been passed on at Rockport, Grandview, Eureka and Evansville, that Governor Ralston would assume the relief for those places.

The work of rehabilitation was almost equally divided between town and country districts. In Shawneetown, Ill., and Uniontown and Caseyville, Ky., the towns suffered great damage, and relief was mostly in the form of house

repairs, moving houses back on to their foundations, furniture, clothing and provisions.

In country districts, it was largely in the form of feed for teams and other livestock, farming implements, furniture, clothing and provisions. In a few instances, horses that had been drowned were replaced. Many houses were totally destroyed but as they were the property of the land owners, they were not replaced or repaired.

Altogether 2,126 registration cards were made out and passed upon; and excluding the communities taken over by Governor Ralston, 1,634 beneficiaries were placed upon the relief lists in the sixteen remaining communities, for which the relief aggregated \$95,270.74.

It is remarkable and gratifying that in all the territory covered by the writer and his associate, there was no loss of life, no epidemic of disease and comparatively little illness of any kind. The nearest approach to a drowning was when a jolly and popular pastor of a church in Shawneetown, in landing from a motor boat in the darkness of a rainy night, stepped off into water thirty feet deep. He was hauled in and did not even lose the handbag which he carried.

The gratitude on the part of the people was deep and genuine. A good old German blacksmith in lower Mississippi county, who was universally beloved by all who knew him, had lost his furniture and all his wood and timber for repair work and many of his tools. He had gathered up such remnants as he could find and had tried to open his shop in an old shed, but he had but little to work with and was utterly discouraged. When, on behalf of the Red Cross, he was presented with orders for blacksmith supplies aggregating \$110, his gratitude was beyond words. He could not speak English very well, anyway, so he expressed his feelings in a language that has been universally understood since the days of Adam, and cried like a child with joy and thanksgiving.

A Red Cross Agent's Personal Experience¹

Johanne Bojesen

DISTRICT SECRETARY, NEW YORK CHARITY ORGANIZATION SOCIETY

IN retrospect, Dayton presents a somewhat kaleidoscopic appearance; but the final impression left on my mind is one of intense vitality. From the pitched battle fought between nature and man, to the overthrow of a bad political government there were no dead-and-alive issues anywhere. And this vigorous life did not make itself felt in man only, but in all he fought against, in all he fought for.

There was the mud in all stages, on

¹Part of the forthcoming Red Cross report on the floods of 1913.

all things, insidious, sinister, refusing to let go, on the people, on the workers, on myself. I was nervously conscious of its adhesive qualities and somehow sympathized with those who threw things away instead of trying to clean up. I threw my own things away one by one, but still it clung.

There were the rubbish heaps covering sidewalks and streets, representing

the household goods of the inhabitants of Dayton, the clothes and occupations of her people, the stock of her merchants, not inanimate heaps but almost breathing loss and sorrow and need.

There were houses lying overturned a block and a half away from where they belonged, with walls caved in, roofs off, foundations lying bare. In the fire district were still smoking embers of what had been the homes of Dayton.

But it was the people first and foremost that impressed me,—throngs of people in the relief stations, reluctantly filing into line to register for their var-

ious needs. Rather silent throngs they were during the first weeks, with tense, haggard faces, each intent on his own business, preoccupied with his own losses, and all keyed up to a high pitch, that did not allow weeping and wailing but presented rather a stolid front. Later on, as the strain gave, the same crowd now eager, clamoring, impatient, discussed the situation with everybody, telling over and over again their own part in it to all who would listen. From day to day they planned rehabilitation and from day to day changed their plans as their stunned energy reasserted itself in an incoherent and not always pleasant way, and they jumbled and jostled each other and the workers.

A Convict's Donation

There was the National Cash Register plant which impressed one as a sort of huge kindergarten, with its many lights, its hundreds of employes told off on relief service, its quantities of food, of mottoes, of bewildering underground passageways; and the sleeping quarters where, with forty or fifty others, I rested my weary bones.

And there were the soldiers—they were everywhere. I was most conscious of them in my own station where two regiments were quartered, where all my house-cleaning, such as it was, was done under their direction by men locked up over night for disorderly conduct or evasion of duty of some kind; where once a delegation of them appeared with a donation to the Red Cross of thirteen cents,—this being confiscated goods found on a convict who had left that morning without claiming his property; and on the streets, where they would get me an automobile to go home in, calling it to halt as soon as it had well started—keeping a marvelous order in things.

There was the dignified Colonel Catrow who came in for an interview and informed me that, through some misunderstanding on the part of some of my volunteer workers, all the male population of Dayton, except those on my own premises, were at the time standing in line outside General Wood's office in the Algonquin under the impression that he was in special charge of the rubber boots and would give them out personally, whereas, in fact, I was politely assured, he had only one pair and was wearing those himself. I promised eagerly to send the Dayton men elsewhere for footwear henceforth.

There was Mr. Frizell who in his courtly way reminded me that it was time to partake of refreshments and led me out into the soldiers' quarters, where I was treated to huge portions of their own fare. Sometimes Mr. Frizell suavely rubbed off the rough edge of some quick remark of my own to an annoying visitor, while he deftly "shuf-

HOMELESS REFUGEES WAITING FOR RELIEF IN DAYTON

fled the deck" assigning each family record to the geographical district where it properly belonged. I feel an undying gratitude to him for bringing me some of my best volunteers,—mostly teachers, though a goodly number were not—quiet, cheerful, sympathetic, many themselves flood sufferers but able and willing to do their part to relieve the strain, showing a capacity for team work in ways for which they were absolutely untrained, in a manner that did credit to their general mental make-up.

The Helpers' Task

And there were the Y. M. C. A. boys, the secretaries of the various departments and their courteous, co-operating chief,—all helpful, good-natured, patient, and in fact greatly facilitating a hard task done under somewhat difficult conditions. The crowds did not allow of smaller quarters than one-half of the entire lobby; and to maintain semi-order and get the work done where you were keeping five or six departments separate, where your only partitions were

chalk lines and moral force—this was a task you would never forget, if you had ever confronted it.

Inseparable from the workshop is the impression of a cold drizzling rain that used to penetrate the building where the heating apparatus, as everywhere else, was out of commission, where the cellar was filled with water and where the air was fetid and devitalized by the crowds that occupied every conceivable space; where I tried to barricade myself behind chairs and tables against the people who all wanted to see the agent in charge because there was always a special side to each one's particular problem differentiating it entirely from the problem of everybody else; where I tried to pass on emergency relief, to read cases, instruct visitors, direct interviewers, listen to special appeals of pastors, doctors and others in

behalf of their clients; where I was expected to give advice as to resources about which I had not the smallest knowledge; where folks not knowing better held me accountable for work which was being done in the other end of Dayton, and from where I was also expected to turn in my recommendations for definite grants on investigated cases fast enough to satisfy the throngs that would not give me five minutes a day to do it in.

There is no doubt that this driving tension affected the work—we were face to face with actualities that we could not govern but must fit into if we would be of help or accomplish anything. All preconceived notions, however excellent, had to be laid aside, and the worker's greatest asset was a capacity for quick adjustment and still quicker readjustment as the situation psychologically and physically changed from day to day. The need was primitive,—it was for the first essentials of bare living; it was emergent,—people were bunked in schools and churches or living en

masse in each others' houses. We could only guess at the possible registration in those early days and it was not known how large the funds were going to be, all of which had to be taken into consideration in the recommendation of each case.

This station had been opened for registration the day before I arrived and the third of April found us established on a very modest scale at a small table in one corner of the lobby where exactly twelve applications were received while two visitors were kept busy. The following week saw the work largely increased. The people had begun to learn what registration signified and the emergency lines for food and clothing gathering in other parts of the hall had been turned in our direction if preliminary inquiry had brought out the need of home rehabilitation. From then on to the close of the registration two months later seven long tables were kept filled with interviewers on one side, applicants on the other, the daily number of interviewers averaging about fifteen and registrations running from 135 to 200 a day.

The Need of Routine

An index card system was established within three days, the object being to protect us against duplicated registration right on the premises, as the records themselves when once passed on, were sent to Mr. Devine's office at the National Cash Register. Thus another department with two volunteers to run it was started and each interviewer had her record identified before completing it. A mass of duplication was avoided for people seemed to think that it would be safer to fill out as many registration blanks as possible.

As the emergent relief stations were soon placed under the Red Cross, making but one registration line, and further, as the actual supplies in the Y. M. C. A. were removed to Memorial Hall, the call for emergent relief would come simultaneously with that for home rehabilitation and for six weeks more or less such relief as stoves, mattresses, bedding and clothing was given out on the basis of the registration before the case was looked up, to prevent unnecessary suffering pending investigation. The task of writing out requisitions for such cases was enough to occupy one person's time.

Visits were reduced as far as possible to an established routine. It was impossible with so large a number of untrained workers to give minute directions on each case—it was equally impossible to trust much to their judgment or discretion. The routine call was the safest method by which to secure such impersonal information as would make possible the forming of a fair judgment. One call was to the flood address to

verify the applicant's statement and another to some responsible reference. Then records with the visits entered were read by the agent and such as needed further corroboration were turned back to the visitors with written instructions of how to proceed. Finally, my recommendation went on the record and it was sent to Mr. Devine for his decision.

Closing the Bread Line

When furniture orders and cash grants were first given out they were sent to the respective districts from which in the beginning attempts were made to deliver by visitors. This soon proved impractical and notices were sent to the beneficiaries to call at the stations for their grants. It was also found a great handicap to have grants delivered from so many stations, and as people who had originally registered at the Y. M. C. A. naturally came back there for what they were to receive, it was decided to have all grants given out from that station. So another department developed, with three or four clerks attached.

About this time also it was found imperative to close the bread line which had been standing in Memorial Hall. For three or four days before this was done two interviewers from the Y. M. C. A. were stationed in the hall and took a full registration of each applicant, so that if necessary a cash grant or other provision might be made for such as would otherwise suffer because of the cessation of supplies. The bread line was closed definitely in the last remaining relief station in Memorial Hall on April 21 and from that time on appli-

cants for food were referred to the station in the Y. M. C. A.

At this time also inquiries and complaints began to multiply by applicants who had not yet heard from the Red Cross and who were becoming anxious lest they were overlooked or turned down. These came from all over the city (the other stations having closed), and increased the bulk of work very greatly, mixing with other lines and frequently trying to register again.

An information bureau was therefore started where complaints and inquiries were heard and answered, where changes of address were taken, etc., and ushers were put on the floor to sift the lines—there were four at that time: the regular registration line, the grant line, the inquiry line, and the agent's line. The agent's line was composed of food applicants from Memorial Hall, laborers from out of town who came more or less the worse for liquor and tried by hook or crook to get relief to which they were not entitled, and others of the unmanageable kind.

Busy Days

These were busy, strenuous days, we had no time to generalize or to draw inferences. I could not see the woods for the trees; but I saw the trees, one by one, and trusted to a kind Providence to make me so wise and so harmless that in the final analysis not too much injustice should be found done unwittingly. At last the personal registration closed and the people were notified through the press to make their applications by mail if not already registered. We moved at this time out of the lobby to an upper room where we expected

Photo by Underwood & Underwood

STREET SCENE IN DAYTON AFTER THE WATERS RECEDED

BREAD LINE AT NATIONAL CASH REGISTER PLANT, DAYTON

From the beginning, this plant was a center of resourceful activity

to remain only for a few days while winding up but where we were for over a month, continuing to investigate applications that came by mail, and to give out grants averaging 100 a day.

The volunteer service had by this time almost ceased. Six or seven volunteers still remained but the rest had gone back to their usual occupations. Almost all of the schools had opened and the teachers had been called back in large numbers; yet, the work had to go on. But already toward the close of April some paid assistance had been thought advisable for the visiting. It was difficult to get round, the volunteers were unused to the severe physical strain, and the force was continually changing, keeping the efficiency of the work at the lowest standard.

We thought in the Y. M. C. A. that if we employed some young men with a fair education who knew the town and concerning whose physical endurance we need not worry, that to a large extent we would have solved the problem. We secured such service through the Y.M.C.A. and kindred institutions, though, frankly speaking, a slight doubt remains as to whether the solution was as happy a one as we hoped. Still, though very unsophisticated and very crude (their ages ranged from 19 to 22), these paid visitors had a direct straightforward way about them, they told the truth without fear or favor, they had boys' keen powers of observation and quick youthful intuition which made up to a great extent for more mature judgment tempered with personal bias. They were earnest and lovable, those Dayton boys, and their reports, impossible as such, were sources of great delight.

In the beginning of June the Red

Cross work was removed from the Y. M. C. A. to the building of the Associated Charities, where we conducted the final winding up of the mail registration. The last drippings of this, largely duplication of early registration, were turned over to the Associated Charities when the Red Cross closed its work.

Closing Out

My work fell chronologically into three sections, registration, final grant review, and business rehabilitation. Each one followed closely on the heels of the other, each presented a later stage in the process of rehabilitation, and each showed people and work from a different angle.

This "final grant review" was begun immediately after registration proper (personal application or by mail) had closed. It was divided between two of us—Mr. Devine passing on each of our recommendations himself—and took about three weeks. All grant cases fell to my lot and I had the privilege of reading some four thousand records in about five hundred of which calls were made by visitors to ascertain present conditions. This latter was due to the fact that in many cases at the time the first grant was issued, conditions and plans had been very unsettled, leaving us in doubt as to where and how a supplementary grant should be applied.

The last three weeks we spent in Dayton were devoted to aiding the smaller business men, of necessity the last step taken in the work of rehabilitation. Mr. Devine took personal charge of this work

Miss Bojesen became responsible for reviewing all the records on which a grant of any kind had been made; Miss McHugh similarly reviewing all "deferred" records. E. T. D.

and three of us still in harness divided the city into three sections for personal visits; for the questions involved and the size of the grants required experienced service. We were, however, ably seconded by semi-trained workers who had assisted in the other branches.

It was interesting work. For some of us it meant the first chance to see the inside of homes of flood sufferers. Even then, four months after the catastrophe, signs of the disaster still showed in rooms bare of all except necessary furniture, in unpapered walls, many houses not yet being sufficiently dry to make it safe to repaper.

But the people were themselves again, cheerful and strong. Business men and women readily gave all the information they had about their business, which sometimes was surprisingly little. They were running their shops with shelves half filled, without delivery because their horses were drowned, with most of their outstanding accounts gone bad, with hardly a customer in some of the nearly deserted sections or without any shop at all because it had been destroyed with its contents. Brave men and women they were. Most of them had begun again or continued on extended credit and "nerve." It was an object lesson in fortitude and perseverance to see how they were winning out, native and foreigner alike, including the Hungarian in North Dayton,—who by the way, is as shrewd a business man as any of them!

And at last the work was finished. We pulled up stakes at midnight on August 14, and came away marveling at the boundless vitality that came out of great tribulation to prove the survival of the fit.

Flood Rehabilitation in a City¹

THE relief work in Dayton was an integral part of an extensive series of relief operations in Ohio and other states made necessary by the extraordinary and disastrous spring rains of 1913. The problem in Dayton was larger but not essentially different from that of Hamilton, Zanesville, Marietta, Columbus and many other cities and towns. Affecting, however, a much larger number of families than in any other single community, involving the expenditure of a larger sum of money, requiring the co-operation of a larger staff of workers, and being marked by some features exceptionally instructive to students of emergency relief, the Red Cross relief work in Dayton has been thought to be of sufficiently general interest to justify a somewhat full and detailed statement.

The Red Cross registration was planned from the beginning so that it should be sufficient for any household or family relief which might be undertaken. It was determined that it should be so carefully and thoroughly done that it would not have to be done over again. In order to decide how much aid was necessary, information was obtained as to the size and composition of the family, age and earning capacity, savings and other resources, losses in the disaster, relatives who were dependent and those who could aid, plans for the future and other pertinent facts. In addition to the statement from the member of the family first interviewed, some corroboration was always obtained, and a visit was made to the house in which the family lived at the time of the disaster, if it was still in existence, and if such a visit would throw any light, as it usually would, upon the question to be decided. In special departments of the relief distribution such as pensions to widows and children of those who were drowned, house repairs, and business rehabilitation much additional information of a specific nature was, of course, essential.

So far as our records show, there were 116 deaths from the flood in Dayton. Thirty-eight of these cases were found to need aid of some kind. Three of these were widows who were provided for by other agencies. The other thirty-five were given aid by the Red Cross. The wishes of the people themselves were followed as far as possible. Many of them were still so stunned by the blow of death itself as to have no definite plans, and they welcomed suggestions.

In each of the cases needing perma-

Edward T. Devine

DIRECTOR NEW YORK SCHOOL OF PHILANTHROPY AND SPECIAL REPRESENTATIVE OF THE RED CROSS AT DAYTON DURING THE 1913 FLOOD

nent aid the death was that of the chief bread-winner of the family. Three of these were widows with small children. A sum was set aside for each which would provide for their support until the children were of working age, or could be safely left without the mother in case she went to work. The fourth was a widow with an unborn child. Money was given for her care for a year's time.

In the case of two mothers who lost grown sons who were their main supports, grants were made to place them in position to become self-supporting at once. One was given money to establish herself in a rooming-house; the other was given money to improve her home so that she could secure a better income from it.

Two Orphans

Two of the cases requiring permanent assistance were orphans. On one the Juvenile Court was asked to decide the controversy of the proper home for the children. A fund was then provided to help with their education. In the other case—that of a colored girl twenty years of age—the court was asked to decide her legal status, as she was found not to have been formally adopted by her foster-father. The money left to her was for the improvement of his property if she was found to be his heir, or to provide for her an income in some other way, so that she could have periods of rest from work, her health having been broken down by exposure during the flood.

Copyright, 1913, American Press Association

GUARDIANS GUARDING WRECKED JEWELRY STORE IN DAYTON

The first glaring characteristic feature of the disaster after the period of rescue and refuge had passed, was that more than ten thousand homes had been stripped of their furniture. Many houses, it is true, were uninhabitable because of damp walls, unsafe foundations, broken windows, and damaged porches. But such repairs, except in the worst instances, could wait. In the meantime, beds and mattresses, tables, chairs, sewing machines, dressers, cupboards, stoves, dishes, and all the other household goods, were gone.

This appalling absence of furniture was then the first great fact to be taken into account in the rehabilitation relief. It was suggested that the relief fund might buy a large quantity of furniture of the inexpensive kind and bring it to Dayton to be given away as food and clothing had been. This seemed to us inadvisable. In the case of food and clothing there had been no alternative; the stocks on hand in stores had been destroyed and in any case with railways crippled or entirely out of operation, they would have been insufficient to meet the demand for many days. With furniture it was different. The more expensive pieces displayed in the show windows or on the first floors of the furniture stores had either been washed away, gone out of the window, or had been left in such a condition that the proprietors might well wish them gone. What was in the basements had also been lost. But in the upper floors of all the stores, except one which had collapsed in the flood, there were uninjured stocks of ordinary furniture, such as would probably be in present demand.

It was quickly decided, therefore, to supply furniture to the flood victims by means of orders good at any of the dealers whose names were printed on the

¹Written in the summer of 1913 within a few weeks after the withdrawal of the Red Cross from Dayton. It is condensed from Mr. Devine's report to the Red Cross, soon to be published.

RED CROSS NURSE ANSWERING A SICK CALL

back of the requisition. These firms were members of a furniture retail dealers' association, which by resolution pledged themselves not to increase prices, but to co-operate in a broad-minded and public spirited way in making the plan a success. Each dealer in presenting his bill was to return the requisition, which before payment was compared in each instance with the carbon copy on file at the Red Cross headquarters, and in addition a receipt, on a prescribed form, showing that the furniture had actually been delivered to the satisfaction of the customer. It was understood that no discount would be asked by the Red Cross, but that the dealer would in effect give the family making the purchase a discount by disregarding small balances in the dealer's favor or at least by making sure that every dollar in the requisition was represented by a full dollar's worth or more than the worth of a dollar in furniture. Second hand furniture dealers were not included in this arrangement, nearly all of their stocks having been destroyed. Moreover, it was felt that under the existing conditions each family should have some new furniture and that second hand or "flooded" furniture could more appropriately be bought, so far as it was needed, from current wages, or other income. The Red Cross grant would thus furnish a nucleus for a household equipment representing a normal standard of living, as a supply entirely of damaged and second hand furniture would not.

Freedom in Buying

No restrictions whatever were placed on the articles to be bought and no attempt was made to equalize the trade among dealers. All were left perfectly free to choose their dealer and to buy whatever they liked within the limit of the grant.

The amount of the grant of course depended upon the size of the family, earnings, and other resources, losses and other pertinent facts. Some consideration was even given to the standard of

living of the family, so far as this was shown by any tangible indications. Out of a total registration of some eight thousand families, nearly five thousand were supplied with furniture in an aggregate amount of \$157,057.42.²

The Average Grant

A tabulation has been made of four thousand of these requisitions and of the articles purchased by the families to whom they were given. The average amount of these four thousand grants was just under \$35, the aggregate being \$139,733. A trifle over one-half (2,004) made purchases in excess of the amount of their grant, the aggregate amount of the excess being \$37,075.09. In other words, one-half of the beneficiaries added on an average about 50 per cent to the Red Cross donation either from their own money or by going into debt by an installment purchase, or otherwise. On the other hand eighty-seven families purchased less than the amount of their grant, taking due bills for the remainder, to be traded out at some future time. The amount of these due bills was \$1,391., an average of about \$16.00, again a little less than one-half of the average grant.

In many instances other needs than those for household goods were equally apparent and from the beginning grants were made for various other purposes, usually in money. In some instances this appropriation was placed in the hands of some suitable trustee instead of being given directly to the person for whose benefit it was made. Sometimes this was a near relative, but when such an arrangement was for any reason not feasible,

²These figures are subject to slight alteration from the cancellation of unused requisitions, etc., but are substantially correct.

A WOMAN CLEANING ALL SHE POSSESSED
AFTER THE FLOOD

THE RIVER IS STILL IN THE STREET

ible, the money was usually paid in trust to the Associated Charities with full instructions as to the purpose for which it was given.

Dayton has always been noted for its large house-owning population. It is stated on reliable authority that fully two-thirds of its working people own or are purchasing their houses. Many are of thrifty German inheritance who are ready to take advantage of the liberal terms of the Dayton building and loan associations. Their houses were thus usually the results of a lifetime of saving and patient industry on the part of entire families.

In the majority of cases, moreover, the home was only partly paid for, and its owner was not free, as was the renter, to cast the mud from his feet and go elsewhere to live, nor free even to move to another location. How generally this was the situation is shown by the fact that about ninety per cent of those to whom money was given for house repairs had mortgages on their property. The owners' interest and payments continued. His flood damaged property was not salable. His family needed shelter. There was nothing for him to do but to return to repair his house and add the cost to his mortgage, or lose all, unless he belonged to the small minority having savings and outside resources of some kind.

Displaced Houses

The first plan undertaken in the direction of house rehabilitation was limited to the moving of displaced houses back to their own foundations. One or two gangs of carpenters who had been engaged in work on the bridges were put to work at the expense of the relief fund in replacing houses on their foundations. Within three weeks after April 7, twenty-six houses were thus replaced at a total cost of about \$3,500.

The amount of work done on different houses varied from \$30 to \$300. The amount of good accomplished varied likewise, but not always strictly in proportion, as in some instances the houses were in such condition that they did not stand moving; and in one or two cases it was necessary for the owner to demolish them, even after some work had been done in an attempt to replace them. In this experimental plan, the Red Cross did not attempt to do all that needed to be done, but after restoring the house to its normal position left the owner or tenant to repair the foundation and to complete the repairs on the building.

With this experience as a basis for judgment, it was decided that upon the whole, in spite of the difficulties in securing the services of carpenters, masons, plumbers and decorators, the owners would usually themselves be able to make better and more economical arrangements and to do the work more to their own satisfaction, if they made their

own contracts. A new plan of procedure was therefore adopted more nearly analogous to that which had been followed in the furniture grants.

The First Applicants

Cards were mailed to those who had previously registered for assistance, whose applications showed property ownership. These cards called for replies from those who wished to become applicants for housing, specifying the damage to their property with estimated cost of repairs; also for the valuation and mortgage indebtedness of the property. About one thousand applications were received in response, and over two hundred applications were received later from other sources. The investigation of these twelve hundred applications required more than two months with a working force of four visitors, and was not completed until late in July. This prolongation of the work proved to be an advantage rather than otherwise, for as the days passed the actual damages came to be understood better, on the one hand, and, on the other, the resources of the owners were more easily learned, so that a better basis for a decision in every case was possible.

In the first days the applicant modestly asked for \$25 or \$50 to make his repairs. But after he had dug out his house and had been able to penetrate to cellar and roof he found he was likely to need ten times the amount of his first estimates. Joists were found rotting and sinking, furnace and water pipes proved bent beyond repair, floor frames and baseboards were loosened, cement in the foundations was falling out. Perhaps a hundred minor damages could be listed, all of which would require endless work and expense to repair.

The majority of those whose applications were received and investigated were working men with an average wage of \$15 a week, supplemented often by the board of wage-earning sons and daughters. There were also among the applicants a large number of widows, single women, old people, women with husbands incapacitated by reason of blindness, permanent injury or illness, whose income was more limited even than that of the working man with a family, and which had frequently been derived wholly from the damaged property.

With reports of family circumstances and needed repairs in hand, a careful study of each case was made with a view to determining whether or not the owners needed financial assistance, and if so, what proportion of the repairs it was justifiable to leave them burdened with. This decision was comparatively easy to reach in cases where there was a regular income and where repairs did not amount to over \$300. Usually in such cases about one-half or two-thirds of the cost of repairs was granted.

However, where the owner was a widow or a single woman, or an old man whose working days were waning, the full amount was frequently given, as it was evident that they had sufficient burden in earning their daily bread.

The cases of seriously wrecked houses requiring from \$500 to \$1,000 for repairs, and the decision as to the amount of assistance to be given, presented a more serious problem. Where the property was already heavily mortgaged the owner often could not borrow more and seldom enough for his repairs, while the Red Cross grant could not be made large enough as a rule to cover the cost. In such instances help was sought from relatives and other outside sources before any decision was made. Usually the amount given by the Red Cross was that which was needed over and above what the building and loan association considered safe for the owner to assume, less the amounts which had been raised outside. Occasionally additional grants were made to cancel a second mortgage or to pay delinquent taxes or interest. In cases of houses badly wrecked when the owner was still able to borrow on his property and was of good wage-earning capacity, the grant was made sufficient to give him a good start on his repairs while leaving the burden largely with him.

Demolished Houses

Demolished houses were a problem of their own, one which was not so satisfactorily worked out as might have been desired because of the inability to secure an accurate list of them at any time. Investigation of these cases sought, naturally, for information different from that where there was property to repair. Was the property occupied as a home or was it a source of income only? If a home, how was the family situated now? Did they have plans for rebuilding? If the property was still mortgaged had they sought for any adjustment of their loss?

In eighteen cases plans were being made for rebuilding. The applicants in these cases were urged to arrange with some building and loan association for the balance of the money. After they had done so and the fact had been verified, a grant was made, varying in amount from \$250 to \$400.

In several cases in which the property was still mortgaged, the loss had been taken over by the mortgagee leaving the applicant free from obligations. In such instances grants were made usually for the purchase of a lot or a house after such arrangements had been verified. In two instances, both of elderly women, instead of a grant for rebuilding, the money was given to enable them to have a home with relatives,—in one, to have an addition to a son's house; in the other, for the purchase of a share in a

THE RIVER AT THE RIGHT LOOKS DOCILE ENOUGH NOW

brother's house. In twenty instances the property was not the home of the owner but consisted of old houses which were a small source of income to their owners.

No attempt was made, except in one case, to restore such property, but liberal grants were made for the repair of the owners' homes or of other property still standing. In the exception referred to, the property consisted of a house and a store which provided both home and income for two single women and an invalid brother. Arrangements in this case were made with the building and loan association for money sufficient, with the Red Cross grants, to rebuild the buildings.

Mr. and Mrs. H. had a good home which was completely demolished. In her letter of application Mrs. H. wrote:

"The reason I am asking for this help I have no home any more and my husband is sick most of the time and his earnings are not enough to meet our expenses and build without some help. I have to work most of the time and I

have a child five years old and he is under the doctor's care and it takes most everything to meet expenses. We got along nicely before we lost our house. We lost everything and had only what we had on. I know lots of people lost everything too, but I know if anyone needs help I know I do."

In this case the facts were as stated; also, a child was born soon after the flood. The property was in a good location and the mortgage was small. The building and loan association were willing to increase the mortgage if the family would rebuild. For this purpose, \$400 was given Mr. H.

The total amount expended for the repairing of houses in Dayton was \$130,255.37, of which \$3,412.25 was expended as described, through a contractor, and \$126,843.12 given in individual grants. The number of grants made was 1,082, making an average of \$127.45 for each grant.

Money was paid directly to the people themselves with a very few exceptions. It was felt that if the investigation had

been sufficiently thorough in finding those who most needed help, they could be trusted in the use of it. The grants were called for in person, however, and the plan for the use of the money was explained in full if it seemed necessary.

Before long it became evident that in contrast with this immediate restoration of the normal incomes of laborers, there were scores, even hundreds, of families who had not only, like the workingmen's families, lost their accumulated possessions, but also, at least for the time being, their means of livelihood. Expressmen had lost their horses and wagons; carpenters their tools, ladders, and lumber, cement workers their moulds and mixers; tailors, their sewing machines and materials for repairs; milliners, their stocks and fixtures; undertakers, their caskets and equipment; bakers, their ovens and delivery wagons; barbers, their chairs and mirrors; druggists, grocers and all retail merchants of all kinds everything on the first floor—usually the only floor of their place of business—and in their cellars and basements. Many of the business men were of course indebted to wholesalers, jobbers, and manufacturers for the goods in their stores at the time of the flood; many of them on the other hand had outstanding accounts of customers whose ability to pay was at least temporarily suspended if not entirely destroyed by the common disaster.

Helping the Business Man

Of course, the larger manufacturers and merchants had also their serious problems out of which bankruptcy or voluntary application for a receivership was sometimes the most available and honorable escape, if for no other reason, as a means of gaining time for recuperation. Such problems as these, however, cannot be assumed even in part by a relief fund like that of the Red Cross. Some assistance was attempted in their case by the Montgomery County Bar Relief Committee.

On the completion of the family relief and house repairs departments, it was found that there would still be a limited fund which could be used to help out these merchants and self employing mechanics who lost severely in their business and whose resources were not sufficient to enable them to re-establish themselves. This gave rise to the Business Rehabilitation department, which in the closing three weeks of the Red Cross activities in Dayton gave aid to 518 individuals or firms, in an aggregate amount of \$84,280.

After a week spent in examining Red Cross records for suitable candidates for business rehabilitation, and in consulting the records of Dun's, Bradstreet's, and a local mercantile agency, announcement was made in all of the daily newspapers that the Red Cross

MANY FEET FROM THE TRACK

was prepared to consider applications of this kind, careful definition being given of the character and limitations of the proposed grants. A time limit of one week was given for receiving such applications, and it was requested that application be made in writing, although those who appeared at the Red Cross office in the Associated Charities Building were registered at the time of their call.

In all, consideration was given to 766 applications or recommendations for aid of this kind. Two hundred and forty-eight were considered not to need further assistance than had already been given in other ways or to have such re-

sources as made them ineligible for business grants. Many of them had not in fact made application but were visited only because one of the mercantile agencies, or perhaps one of the Red Cross workers, found some indication that there was at least occasion for an inquiry.

The grants made to 518 business concerns may be classified as to amount as follows: Under \$100, 117; \$100 to \$149, 135; \$150 to \$199, 75; \$200 to \$299, 125; \$300 and over, 66. The average amount of the business grant was \$162.70; eleven were of \$500 each.

This experience was perhaps the most interesting and instructive of the entire

five months. Brief and relatively superficial as the inquiries necessarily were, they revealed the whole structure of the smaller business activity of a typical American city. The difficulties and the advantages of the modest retail enterprise have never been so clearly set forth as in these frank and explicit statements of losses, assets and liabilities, and special circumstances surrounding the particular situation. The disaster being without parallel, both social workers and those who were under consideration for aid felt it no disgrace that the question had been raised, and no false shame was displayed from beginning to end.

Flood Prevention and River Regulation

IN commenting on the floods in Texas in 1899, an editorial in the *Chautauquan* magazine stated that "the worst feature of the situation is that there is nothing to prevent frequent recurrences of the calamity." It will not be amiss to inquire whether such a statement may still be made, and if not, what is happening to make it inapplicable.

The history of almost every race begins with a legendary story of a great flood. And from the time of the Deluge to the present day, great rivers, their use, and their irruptions have played a leading part in determining the movements of commerce, in encouraging and destroying civilizations, in making and unmaking empires. The names of Tigris and Euphrates are inseparably linked with the rise and fall of Persia, as the problem of the control of the Nile has been the determining element in the development of Egypt. Tacitus tells how the Tiber, by repeated outbreaks, overturned and swept away the buildings on its banks, and contributed a powerful impetus to the decline and destruction of the grandeur that once was Rome.

The *Encyclopedia Americana* gives a list of great flood disasters from the seventh to the end of the nineteenth century. Although many were seacoast inundations due to storms or earthquakes, the number gives some idea of the universal occurrence and the historical importance of floods. Those due to river floods number twenty-nine, but the list omits thousands of minor floods. In our own country for instance the Mississippi river was in flood about twenty times in the nineteenth century.

Since 1900, flood damage if not flood frequency in the United States has been greater than in any preceding similar period. Millions of dollars loss was caused by the Mississippi River flood in 1903, and in the same year the great floods occurred in Kansas and in Oregon. The next significant year for

floods was 1907, when great damage was done in the Ohio and Mississippi Valleys. Again in 1912 the Mississippi river was in flood, reaching at many points the highest stages then recorded and causing an estimated flood damage of about \$80,000,000. And so the list might be extended indefinitely, to include the Hudson, the Genesee, the Susquehanna, the Savannah, the Brazos, the Colorado, the Sacramento—almost every river, in fact, throughout this broad land.

Our Recent Experience

No period, however, has ever served to direct the attention of the American people so strongly to the menace of the flood problem and to the importance of steps to control it as that of 1913. The gigantic relief operations told about in this very issue serve to emphasize the needs of preventive measures in order to avoid the necessity of such remedies.

It is in the lessons of the floods, the measures to prevent their repetition and the prospects of the future, that we are now interested. Surely we in America do not need so severe a course in the school of experience, as that in China to convince us that millions for prevention is better than still more millions for relief and rehabilitation. The earliest floods no doubt were considered unavoidable inflictions of an outraged deity and suggested no preventive measures to the survivors, but very soon the idea must have occurred to men that something might be done to protect them from such disasters. There is no record that Noah concerned himself with any such measures after landing on Mt. Ararat. But the embankments along the Yellow River in China were first built untold centuries ago, and many ancient

protective walls remain to testify to the spirit with which man resisted the attack of the angry element.

Nor are levees and walls the only flood relief measures of ancient origin. It was but a few years after the beginning of the Christian era that a "flood commission" in Rome recommended the construction of reservoirs and diversion channels to protect the city from the destructive Tiber.

In our own country, organized effort for flood protection dates back at least fifty years. Since that time, the federal government has expended over \$40,000,000 in building levees and bank protection in the Mississippi valley, which with the amount spent by the local levee boards, makes up a total expenditure of over \$100,000,000 on this work. Like other efforts, however, this movement has been in the nature of a fight to carry out a plan originally conceived as the best type of protection against the immediate dangers which threatened. At no time, either in the beginning, or since, has there been apparent a disposition on the part of the nation to give to the problem consideration and appropriations commensurate with its magnitude and sufficient to determine whether the plan, excellent as have been its results, is really the best that could be devised for the entire drainage basin.

Point is given to this question by some important developments of the past few years. Many extensive works for irrigation and many large water power developments built by the government and by private interests have done away with excessive flood discharge at times of storm. Several notable studies have indicated that other methods may be advantageously used to supplant the levee system, and to replace it in some portions of the country. And several alternative plans have been urged upon the country by groups of their supporters; so that there is now a disposition

Morris Knowles

MEMBER AMERICAN SOCIETY OF CIVIL
ENGINEERS

to reopen the entire subject and give it a scientific review, such as it has never had, and such as will place it on a firmer basis.

The earliest and, in some respects, the most important of the recent studies that have led to this situation was that of the Pittsburgh Flood Commission, carried on between 1907 and 1912. This commission concluded that the most advantageous protection for the city of Pittsburgh from flood losses which had totaled \$20,000,000 in the preceding seventeen years was not bank protection or channel improvement alone, but such work combined with storage of that portion of the flood water above the danger line—that is, the “flood peak.” In a comprehensive and well-considered report, it recommended the construction of seventeen storage reservoirs in combination with a low concrete wall for certain portions of the city. Although criticism has been directed at some features in the report, no one has seriously questioned the practical value of the plan for its purpose at this place; and the report has served the purpose of calling attention strongly to the fact that this method of flood prevention is applicable to some portions of the United States as well as of Europe.

Ohio Studies

As is frequently the case with pioneers in many fields of endeavor, Pittsburgh is likely to wait and watch others reap the result of its educational propaganda. Commendable report from the National Waterways Commission has brought as yet no favorable action at Washington, except the purchase of some forest lands under the authority of the Appalachian Forest Reserve bill. Request for a state appropriation to build one of the seventeen reservoirs on the Youghiogheny river resulted in a veto by the governor. A small appropriation was granted the State Water Supply Commission to make a start toward the conversion of Pymatung Swamp, at the head waters of the Shenango river, into a huge reservoir, which will prevent floods, increase greatly the low water discharge of this river, and be of great help in the Beaver river below.

The usefulness of various methods of river control has been driven home more recently by the studies made at Columbus and at Dayton, Ohio. At the former city, a channel improvement project has been recommended, as most economical from the local point of view. The report states, however:

“Reservoirs on the upper watershed have been found practicable at reasonable cost.

“Reservoirs aid not only Columbus but Delaware and the entire valley, even as far as Chillicothe. Should any combination of interests be effected. * * * reservoirs * * * combined with channels will have an advantage over all others.”

“Conservancy Districts”

At Dayton, seven detention basins have been recommended, together with some channel improvement, to protect all the cities in the Miami Valley. There has not been much evidence adduced, however, based on comprehensive engineering studies, regarding the adaptability of outlets or spillways, and the value of methods of retaining precipitation in the soil.

But Dayton and Columbus are not the only cities that have devoted attention to the problem of preventing a recurrence of the 1913 disasters. Letters addressed to a number of cities have recently elicited the following information: Eleven places—Defiance, Delaware, Findlay, Lima, Marietta, Tiffin and Wells-ville in Ohio; Brookville and Grant County, and Indianapolis in Indiana, and Shawneetown in Illinois, report plans under way for the widening river channels, building levees, raising streets and other measures. At both Dayton and Columbus some levee and other repair and minor improvement work has already been carried out which will protect somewhat against similar floods.

Railroads have given much attention to flood flows in the reconstruction following the flood. Wherever bridges had to be restored or repaired, studies and surveys were made to determine the probable maximum discharge and the opening required to pass it safely; then structures have been made to conform to these standards as nearly as possible.

The striking fact about these various plans, however, is their entire lack of co-ordination, resulting from a default of any general plan or supervising authority. An effort has been made to remedy this in Ohio, where, after a month's consideration in special session, the legislature passed on February 16, 1914, the “Ohio Conservancy Act.”

This law provides for the organization of “conservancy districts” for the purpose of carrying out flood prevention and river improvement projects. Such districts may be created by the Courts of Common Pleas, on petition of five hundred freeholders, or a majority of property owners in the proposed districts. Provision is made for public hearings on the organization of the district, and on the adoption of an “Official Plan.” But after protests are reconciled or disposed of, and after the organization and plans are adopted, a large measure of authority is given to the board of directors, which is to be appointed by the court, to exercise the right of eminent domain, to issue bonds, to construct works and to assess the cost equitably upon the owners of property benefited.

On the day following the signing of the law, a petition was filed by 1,656 freeholders, three counties and five cities in the Miami valley to organize the

“Miami River Conservancy District,” for the purpose of carrying out the plans prepared the Dayton Flood Prevention Committee, which is composed of able, public-spirited citizens of great force and capacity. This project provides for an entire drainage basin, that of the Great Miami, large enough to treat the stream as a unit from its source to its mouth—a very important desideratum in all such problems and one too often forgotten. Many surveys and plans have been made and construction work can start immediately after approval of the official plan.

Strong opposition to the organization of the district at once developed from some people in the valley above Dayton, and in the sections where the proposed reservoirs are located. The former appear to feel that the plan has been prepared with an eye single to Dayton's welfare, and that they are to be asked to pay for the larger city; the latter appear to fear principally that their property may be taken without adequate compensation.

Attacks on the Law

The constitutionality of the law has been assailed. It is contended that such a court, specially constituted of one judge from each county affected, is not duly authorized by law to legislate and administer such duties and that the law delegates power of taxation to a non-representative body of directors not chosen by the people interested. The accusation has been freely made that the whole plan is a scheme of “power grabbers” to develop water power at the dams and to create a power monopoly in the valley, which will eventually make the basins unavailable for flood storage. Such intention is just as emphatically disclaimed by the committee, and there is even talk of asking the court to make it a condition of the incorporation that no power shall ever be developed at any of the dams.

The first hearing on the Miami district held by the court on March 20th was an impressive scene. Nearly two thousand people gathered in Memorial Hall, specially used for the occasion as a court house, with ten judges on the bench and fifty lawyers in attendance, representing cities, towns, counties and property owners throughout the valley. At this writing, due to the legal battle, no hearing has been held upon the engineering or physical features of the project, but a board of eight consulting engineers has been convened to consider these questions and present testimony to the court when opportunity offers.

The principal difficulties of the Ohio situation are due to the fact that under the law one portion of a valley may be put in the position of trying to force another part into the district, when no higher authority than both districts is

provided to decide whether the plan is in the best interest of both than the judges elected by the people of the several counties affected. The decision of the court, of course, must be based on a balancing of conflicting evidence, much of which will be highly technical, and presented by interested parties. It is hardly to be hoped that this decision will satisfy the opposing interests or secure unity and harmony of action as well as would the decision of a properly constituted state authority, with technical equipment and full power to conduct its own engineering investigations. Still it may be and likely is the best that could be done under existing conditions of opposition to state house control and the prevailing hue and cry for "home rule."

Ohio Flood Board

Bills were presented in the last legislatures of New York and Pennsylvania to make possible the organization of such watershed or conservancy districts, under the supervision of a state conservation commission in the one case and a state water supply commission in the other, but both failed of passage. Such legislation would offer some advantages over the Ohio type of law, where the comprehensiveness of the plans and their technical value are due solely to the breadth of view of the promoters and the ability of their engineers, and not to any provision of the law.

But even such legislation falls short of the mark, if hope is entertained that the Mississippi river problem and the question in its country-wide aspects will be handled in a comprehensive way. It has come to be more and more recognized that the satisfactory regulation of large interstate streams will necessitate the exercise of control by the regulating body of their tributaries, both within and beyond state borders.

In other words, every stream, even the Mississippi river, with its million and a quarter square miles of drainage area, must be treated as a unit from all its sources to its mouth. And the only authority capable of effecting such treatment, legally and economically is the federal government. The Ohio Flood Board, in its preliminary report submitted to the chief of engineers, U. S. A., on May 26, 1913, emphasized this particularly with respect to the prevention of encroachments on stream channels, as follows:

"The board has been much impressed in its examination by the evils of divided control of the water courses * * * but since the control of rivers is in the twilight zone between the spheres of federal and state authority, it developed that what was anybody's business was nobody's business, and no effective authority has been exercised by anybody. * * * It is the opinion of the board that the authority of the United

States should be exercised to prevent encroachments upon them exactly as in the case of navigable streams. It is believed that this is the only method of control which promises good results in practice."

The same argument is equally applicable to federal control of all other factors affecting the regimen of tributary streams.

Some Federal Bills

That some type of federal control of rivers may be expected in the not very distant future is intimated by the number of bills now pending in Congress with respect to river regulation. Most of these, probably, will receive little consideration. But several have attracted much attention, and have extensively organized support in many parts of the country.

The Newlands-Broussard bill is a comprehensive measure providing for a waterways commission and a board of river regulation. The latter is required "to develop, formulate, prepare, consider, and determine upon comprehensive plans for the conservation, use, and development of the water and forest resources of the United States in such a manner as will best regulate the flow of rivers and their tributaries and source streams, and the stage of water in inland waterways, and the confinement of all rivers and waterways at all times within fixed and established channels," and may for that purpose adopt any and all possible methods.

Co-operation is to be brought about between these new bodies and the various existing departments and bureaus engaged upon work of a nature likely to be involved in or helpful to the purposes of the bill, and \$60,000,000 per year is to be appropriated for the next ten years.

This bill has the support of the National Reclamation Association. Of all those now pending in Congress this bill exhibits the largest grasp of the problem, and presents a national point of view, which should commend it to all earnest students of the question. In the opinion of its more conservative friends, however, it could be greatly strengthened, from the point of view of statesmanship if not of politics, if it laid still more emphasis upon the necessity for fundamental investigation and for securing of data and exhibited less of the desire to "see-the-dirt-fly."

The Clark-Williams bill provides for the setting aside of all money received from the sale of public lands in certain states, together with an appropriation of \$20,000,000 as a "flood protection and drainage fund," to be used for works of all kinds, "for the prevention of floods, or for the protection, drainage, or reclamation of overflowed lands, swamp lands, and lands too wet for agricultural purposes," and provides for the return

of money expended from this fund by the sale of reclaimed lands. This bill has the support of the National Drainage Congress.

The Humphreys-Ransdell bill, known to its opponents as the "levees-only" bill, and backed by the Mississippi River Commission and the levee boards and associations of the lower Mississippi Valley, would provide an appropriation of \$60,000,000 for completing and strengthening the system of levees projected for the lower Mississippi. The advantage claimed for this bill is that immediate action would make it possible to protect the lands subject to overflow, whereas they charge that any measure like the Newlands bill would require years before any beneficial effects, if at all possible, would be realized.

Another bill that has attracted a good deal of attention is the Dyer bill, providing for the investigation of the problem, but requiring study particularly of the Riker "spillway-plan"—a project for carrying the flood flow of the Mississippi through a large spillway or by pass running from Cairo to the Gulf. Several other bills have been introduced, providing for investigations with or without provision for federal participation in construction.

Promise and Danger

There is promise in this varied activity. But the principal danger to be avoided is that of permitting the proposition to be determined by the characteristic American demand for action, and the feeling that "when investigation begins, accomplishment ceases". Here is a problem demanding for its solution all the resources of modern science, deserving because of its importance the most mature consideration, worthy of the best intellect and ability of the land.

Federal investigation and federal supervision are essential and immensely more important than federal funds. Moreover, any solution which does not recognize the relation of the flood problem to the greater one of conservation, which does not provide for complete utilization of water, as well as for flood prevention, will be but a partial one. And a rational understanding that much can be accomplished by intelligent direction of private enterprise in the utilization of water, will greatly relieve the burden upon the public credit.

Any bill which fails to square with these principles and which subordinates the essential to the non-essential, the demands of the situation to political expediency, deserves to fail and it is believed will ultimately fail. But if an act is passed which is truly statesmanlike in its grasp, the result will be, not only an incomparable boon to the nation, but undying credit to its originator and its supporters.

"Beauty for Ashes"

A narrative of discovery out along the road from
a woman's threshold

CHAPTER VII. HOUSING BECKONS

Albion Fellows Bacon

"IF IT hadn't been for my light, Irish heart, I'd have been dead long ago," a woman of many sorrows once said to my mother. The same might have been said about my mother herself. It is well that she passed on to her children this happy Celtic strain, along with her feeling for the unfortunate, or the latter might have sunk us with the submerged.

Year after year the demands upon me grew heavier, as church work, charity work and civic work made irresistible appeals. "It's a case of frenzied philanthropy!" I told my sister, describing the whirlpool rapids into which I had been drawn. Following the Nurse's Circle, the Friendly Visitors, the Flower Mission and the Working Girls' Association, had come the Civic Improvement Association, the Monday Night Club, and, growing out of that, the Anti-Tuberculosis Society.

Truly, I had come far along the White Road that led from the Big Gate! And yet I never got more than an hour's journey away from my home, for the road wound around and past it. I could stand on my threshold and look down the rocky ravines, upon those who were beaten and robbed and left to die. I looked out—the scene called me. I looked in—the warmth and brightness gave me courage to go.

Whenever it was possible, I summoned the clubs and circles to our home, so that the family might have part in them. And so, though my work took me out into every avenue of public activity, these all centered in my home.

What an outlook I had now from my own threshold! What an outlook any woman has, in these days, who is willing to see. And how, in perspective, things assumed their right proportions! A thousand little worries fell away from me. The great, simple, vital facts of life rose above the trifles. Things that would last and wear and help, things of first value, took first rank. Looking out over the social wreckage, I realized the sanctity of the home and the rights of childhood more than ever before.

It was not only by going among different classes of people that my view had been broadened. There had come

COURAGE

The world is for the brave at heart,
And Time waits on their will.
The days draw nigh thy high desire,
Be though but patient still.

And every tide shall bear thee on,
And every wind shall fill
Thy sail, to help thee to thy goal,
Have thou but courage still.

much enlightenment from those men and women with whom I worked. From each one I learned some vital fact or some bit of valuable method. It all went into my equipment, which I was daily learning to value more highly.

Social Symptoms

The same eager group formed the center of all our circles, and if I were to tell the story of my own experiences, my story would tell theirs, too. In fact, it might pass for the story of any one of those hundreds of men and women all over our country who are trying to help lift the burdens of humanity.

I have watched the development of many social workers, and it seems to me that they go through all the stages of an eruptive disease! First, the knowledge of evil gets into the system, like an infection. Then there is the chill of horror, followed by the fever of indignation. One is deathly sick at heart, and, at a certain stage, breaks out into numerous activities. At last the light cases get well, and are thereafter immune. But the serious cases have a long fever, and never again have quite the same resisting power.

There is a time when one feels overwhelmed by personal responsibility. At this time many overdo and break down. Further along, one is oppressed by the feeling that all he can do is only a drop in the bucket, and that "reform is a matter of a lifetime." At this stage many despair and give up. Those who can go steadily on with the work when they are sick of it, can keep up courage when enthusiasm burns low, and inspire others when they are worn out themselves,—these are they whose work will count.

When the pressure of the world's need begins to be heavy upon us, we

are apt to feel aggrieved at the slow and perverse generation that refuses to care or to help. We are like Kipling's Horse that was bowed with the burden of cleaning up the muss of creation, and appealed to the Camel for help, with the plea:

"The world is so new, and all,
And there is so much to do, and all."

To which the Camel lazily stretched in the shade, replied, "Humph!"

The group of men and women who had tried again and again to plant a permanent civic improvement organization in our city appealed once more to the public. But the public said "Humph!" to our plans for a city beautiful.

When we opened playgrounds and a swimming pool, the Camel was glad to send its children to splash and to play. That didn't satisfy us then, but now we can see that some of the little camels are growing up to help in civic improvement.

We had planned such great things for the city, and we asked it to come to our meetings, and listen to our lectures.

The city! We might as well have expected the courthouse to get up off its foundations and amble down to hear us. But the papers took up our work, with that keen intuition by which the press divines those things that are for the public good, and they magnified our efforts an hundredfold.

It was the Fourth of July when we opened the school playgrounds. Different members of our board of directors were assigned to do the opening, and one school ground was given to me, to open as I pleased. The twins helped me, beating the drum, carrying a flag, and helping form the children in procession. I wouldn't have had them miss it, for it was a chance to take part in civic work such as seldom offers. And unless the children see us doing things for our city and state, of what avail are our patriotic precepts? And how can we expect them to be public-spirited and to do a citizen's part, unless we show them how?

The children of that neighborhood were out in force, and we had some rousing games, a good play together,

and then a very short and very plain talk about good citizenship. I was particular to have the accompaniment of the drum, with its stirring roll, to some of our patriotic songs. A brass band would have suited me better.

If we could have had pink lemonade and gingerbread, followed by sky rockets, I should have felt still better satisfied. Anything was not to be despised that would leave a pleasant memory of the occasion, for, by psychological laws, in after years any one of these factors should call up all the others, in turn, and end with a general patriotic thrill.

Patriotic Dedication

The opening of the swimming pool was planned for similar results, and it was my joy to help arrange its spectacular effects. At the given signal a "wireless" touch sent off a charge of dynamite, away down the river, with a most satisfying boom. Then, with hundreds of boys and girls looking on, and Mayor Nolan at the post of honor, impressive words were spoken, and red, white and blue flowers strewn upon the water of the great pool. Crash! went the band with the Red, White and Blue, and a great chorus of little voices took up the song. It was a stirring scene.

There was something more solemn in the ceremony with which we opened our anti-tuberculosis camp. Boehne Camp, we named it, for the generous donor. The nurses took part, in a symbolic "opening," as a poem was read. Then came "the sprinkling of the lintels," in imitation of the ancient Hebrew ceremony, with an invocation that the Angel of Death might pass over the place. This was done by Rabbi Meritt, one of the earnest promoters, and we brought a crystal chalice of sparkling water from the pure spring at the camp, into which he dipped a bunch of herbs for the sprinkling. Then the Episcopal minister, Dr. Cross, who had helped from the beginning, read a ritual service, and laid a blessing upon the place, and the camp was given to all sects and all people.

Any civic worker will realize that these ceremonies crowned the hard work of a number of years. During these years Miss Rein had gone to another field. Marcus C. Fagg (now in charge of child-saving in Florida) had taken her place. One of the first fruits of his energetic régime was a Monday Night Club, made up of about twenty-five representative men and women, from different civic and philanthropic circles in the city, and including some of our city officials. For quite a while this met at our home.

Here was a new school for me, and I mention it because of the help its training gave me for broader work. It was the best possible experience to be

chairman of the lecture course committee, having, at times, to fill every post from advance agent to property man. It generally fell to my lot to make the business arrangements with the speakers, attend to the church announcements, furnish newspaper articles, distribute circulars, place the posters, and secure halls and janitors. Sometimes meeting a train, often entertainment of the speaker, and on occasions his introduction, devolved upon me.

What sympathy it gives me now for those who must arrange with, meet, and find audiences for *me!* With what alacrity I say, "Oh, don't worry about how large an audience you'll have. It's hard to interest people in these subjects."

The opportunity this position gave me to know the fine men and women we brought to lecture was well worth the work. Among them were some of the leaders of our state charities conference into which I had been drawn for several years, that yearly school of philanthropy whose inspiration I acknowledge with gratitude.

There was Ernest P. Bicknell, who has since been called to larger and larger service, and whose great heart is now bearing the brunt of world disaster.

There was Amos W. Butler, father of that remarkable system of laws for the defective, delinquent and dependent, to which the nation points.

Dr. J. N. Hurty, far-famed, with his sharp, fearless lance, always on the frontier line of reform. There was Alexander Johnson, that walking school of philanthropy, beloved in many states, who in one lecture took us to the mountain top of his vision, and set us down five years ahead of where we were before.

There were these, and other men of whom the state is proud. We had men and women, too, from other states to lecture to us. But better than the lecture was the quiet talk with them, afterward, about all those things I was burning to know.

Monday Night Club

We had a housing committee in our Monday Night Club, for the homes of the poor had been on my mind since I first saw them, and year by year had grown the conviction that public interest must be aroused and, somehow, better conditions secured. Mr. Fagg was quite as positive as Miss Rein had been that the condition of our poor could never be permanently improved until their surroundings were bettered. Every effort I made to help them convinced me of this. Some years afterward I was called to a town to help start a housing movement, and was told that both the charities secretary and the district nurse were threatening to give up and leave unless the housing

conditions of the poor could be improved; feeling that their work was hopeless and their strength wasted, without that.

And we were finding out then that our eager efforts to alleviate the wretchedness of the poor ended in—alleviation. The stream of misery flowed on, unchecked, and seemed to be growing larger. We had been doing almost nothing to prevent the evils whose ravages cost so much to repair. From every quarter there was borne in upon me the definite conviction that I could do more for child welfare and for civic welfare, more to fight tuberculosis and typhoid, more to prevent vice and to promote social purity, by bettering the homes of our city than by all the varied lines of effort that had engrossed me. I began to notice how the threads of the social problems, the civic problems and even the business problems of a city are all tangled up with the housing problem, and to realize that *housing reform is fundamental*.

From that time on I began to concentrate my energies upon this one thing, which has become my life work.

The Building Ordinance

The idea was forming in my mind that nothing but a housing law would ever enable us to get relief from the conditions that caused our poor so much misery. But I had not thought far enough to see by what process or by what people it would be obtained. It certainly did not occur to me that I should have a hand in it. "The people that 'tends to things' would do it, some time, I supposed.

One morning, picking up the *Courier*, I saw that a building ordinance was about to be presented to the council. It occurred to me that this was the time and the opportunity to get some tenement regulations, by having them included in this ordinance. A sudden impulse came to me to go myself at once to Mayor Boehne and ask his help in getting the necessary provisions into the ordinance.

If ever there was a good mayor, it was John T. Boehne. A man of broad policies and strong integrity, who had made a record by his determined law enforcement, it required no courage to approach him. Within an hour I was sitting in his office telling him the story of our poor and their great need of protection by law.

"Can't we have a few sections in that ordinance that will regulate tenements?" I asked, in conclusion.

"Yes," he said kindly, "You go home and prepare the proper sections, modeled after those of other cities, and I will see that they are introduced as a part of the ordinance."

Home I hurried, with a singing heart. Off flew a letter to New York, one to Chicago, and others to smaller places.

Back came bulky packages that I opened with eagerness, and sat down in the midst of my housework to examine.

How big those tenement laws were—a whole book!

I turned the pages curiously, and read at random:

"In all non-fireproof tenement houses hereafter erected, fore and aft stud partitions which rest directly over each other shall run through the wooden floor beams, etc."

"Well, of all things," I exclaimed in dismay, and called the family to hear more:

"No tenement house hereafter erected shall occupy more than ninety per centum of a corner lot, etc."

Wise Housing Laws

It was a distinct disappointment to me. Was that the kind of thing that tenement laws required? I wanted to give the poor some comforts, some conveniences. I glanced through the book, and didn't see a word about anything that would make the wretched old houses look any better or more home-like. True, there was something about "repairs," but there was nothing about paint or paper, and shacks could be patched up and yet be just as forbidding and desolate as before.

But a careful reading of the parts applying to old houses was more encouraging. After all, I found that tenement laws require light and air, fire protection, water, drainage, sewerage, repairs, prevention of dampness, prevention of overcrowding and all those unsanitary conditions that caused us so much trouble in our tenements.

My spirits rose as I read, for I could see the dark rooms and the sour yards, the old vaults and cisterns disappearing, and with them, tuberculosis and typhoid. If that law had been prepared by some one who lived in our city it could not have hit our slums more squarely.

Now, as to the new buildings—what pages and pages about space, "percentage of lots," "courts," and "air-shafts." We never heard of these latter things in Indiana, where we had "yards" all around our houses.

Just about as odd and uncalled for, I doubt not, does such a law look to a member of the Legislature when he sees it for the first time, if he reads it only once, or half skims it over.

It was well that in the same hour that I realized the things a law could not do in regulating the conditions of the poor, I realized that those things a law could do were the most vital of all. I could see, now, that the things I had been aching for, many of them, were the things that city planners give, and the "garden city" people. I should have been one of these.

But the more I studied, the more

plainly I could see that the law was just what Evansville needed, to cure our old slums, and to prevent new ones from forming. City planning would have saved some of our troubles, and much ugliness, and, even now, could save the new parts of our city. But it would not cut windows in dark rooms, or drain wet cellars, or make landlords connect water mains with old houses.

Adaptation to Evansville

"You cannot easily engraft beauty upon rottenness," and housing reform was needed to cut out all the rottenness, before a City Beautiful could be achieved. And, after all, I could see that it was fundamental to all the better and higher things, even to comfort, even to health, nay, even to decency. Light and air and water—that meant cleanliness and health, and the graces later, with grass and flowers. Safety, privacy, the isolation of families,—that meant safe-guarding the home and the children.

Then, it was to be done. The task lay before me of extracting, out of the material sent me, the regulations that should fit Evansville.

"Not too long," and "make it simple," our housing committee said. But, a simple housing law!

Those who have helped prepare housing codes for our different states will have a vision of what it meant to prepare a limited number of sections for a city of 70,000. Of course, one soon finds out that, in such laws, every other consideration pales and dwindles beside that of space requirements. One finds, too, that these laws are prepared as accurately and carefully as a doctor's prescription, so that the change of one dimension in a "court" alters everything else.

Yet there had to be many changes. I sat, for hours, with a puckered brow and fixed eye, pencil and paper in hand, trying to see all the things that would happen to a room, a yard, a hall, a "court," by given variations on the prescribed dimensions. All the time my reverence grew for the man, whoever he might be, who had been able to write the first tenement law in our country, and to know what and how much of everything ought to be required.

After I had done my best, in cutting, trimming, and adding, I called in our housing committee, and they puckered their brows over the same sections, and over other questions that had bothered me:

"Would this law give the poor the relief we sought?"

"Was it fair to the property owner?"

"Were we making stringent enough regulations?"

"If we made them more stringent, could we pass the ordinance?"

"If we passed it, would it stand?"

Finally it was completed. J. E. Igleheart, one of our committee, gave it the proper legal form, and I took it to the mayor.

It was a comprehensive little bill, though more than the "few sections" I was to prepare, and less than the larger cities had. It went into the building ordinance, which was already a document of enormous bulk. In due time, the council took up the matter, and as promptly put the whole thing back into a safe pigeon-hole, where it lay, gathering dust and anathemas, for many months. Later, the men of our committee took a copy of our tenement regulations to the council meeting, one night, and quietly put it through, as a separate ordinance. But that was long afterward, when we had almost given up hopes of its ever going through, and had taken up a campaign for a state tenement law.

Spreading the Idea

While the bulky roll of the ordinance was reposing in the pigeon-hole, the State Conference of Charities met at Evansville. I had chosen, *The Homes of the Poor*, for the paper I was asked to prepare, and told all I knew about our slums. That evening we gave a reception in our home to the out-of-town guests, and I met many who afterward helped me, some of them prominent politicians. During the days of the conference I took every opportunity to discuss the need of a state housing law with leading members of the conference. Every one of the charities secretaries believed in its necessity and told me of conditions in their cities, like those in Evansville. Some of the others thought the time was not yet ripe. Miss Rein, and C. S. Grout, of Indianapolis, two of the most experienced secretaries in the state, strongly insisted upon the necessity of a state law.

I felt that if we could prove the need for such a law, the leaders of the conference would take it up and put it through. I appealed to some of them and was much disappointed that they did not promise at once to do it, but parried my requests with an indulgent smile. One session of the Legislature taught me why they smiled. But, surely, if we could furnish proof that the other cities of our state had slums, and could show their devastating effects, some organization, civic or philanthropic, would attend to procuring the law. I determined to get all the necessary information, and the advice of housing experts, then to compile different housing laws, and find some organization that would secure the passage of a state law. Somehow, I never doubted that it could and would be done.

The National Charities Conference met that year at Richmond, Va. It

THIS issue deals with ploughshares and pruning-hooks, with the activities of great instruments of war turned to the uses of peace. But even as its articles have been in process of editing and printing there has been a great shaking of swords and spears. The army which did such competent service in San Francisco and Ohio turns from its new avocation of salvage to its old commission of destruction; the Red Cross from rehabilitation of communal wreckage, due to the brute forces of nature, to its old ministry in the wake of man-made havoc.

The change has been part of a process so rapid and on its face, so unaccountable, that within a fortnight we have seen, in the words of one writer, "the best intentioned and most pacific minded leaders of any administration in American history" apparently precipitating "the most dubiously just war in American history, against people that the President himself holds blameless." When a school boy made a grimace at a German lieutenant, and a lame shoemaker—was it?—failed to touch his hat to the same embodiment of imperial dignity, we felt a hot wave of indignation against the German war lords and their insistence on their proverbial punctilios. And yet, within a year, a gulf seaport has taken the place at Zabern!

THERE are two old proverbs having to do with camels, both of which apply with inexorable precision to the present situation. President Wilson has shown such strength and patience in dealing with the drove of camels to the south, that the day of the gnat has taken us with surprise and sorrow. The very confidence increasingly felt in his ability to solve the heavy problems confronting him has in itself delayed any common expression among social workers in the present crisis.

It is safe to say, however, that you would go far to find among settlement residents, or district visitors, or probation officers, or any of their kind that have to do with the neighborhood life of the people—with its mixtures of good and bad, its strivings and its loyalties—even one who followed the secretary of the navy in his bombast that the course of the people of Vera Cruz in defending their homes was an aggressive act of war, whereas our seizure of the town was not.

It is safe to say that the majority responded to the chords struck by Senator Root in his powerful destructive criticism of the grounds on which the

administration asked Congress to justify its course:

"Men dear to us will die because of action we are to approve to-night. American homes will be desolate, widows will mourn, and children go through life fatherless because of what we do to-night. And when they grow to manhood and turn back the pages of history to see why their fathers died, will they find only a difference as to the number of guns and the proper practice of salutes?"

There is less likelihood that social workers followed the argument of the senators from New York and Massachusetts, that such justification is to be found in the American lives sacrificed and the American property destroyed in the months of civil war, of violence and anarchy, which have racked Mexico. We have most of us subscribed too heavily in the past to the positions taken both by Mr. Taft and Mr. Wilson in holding out against this reasoning, not because of unconcern for the jeopardy to our fellow-countrymen, but in the belief that such intervention would be but to repeat in terms of modern economic conditions, the war of the slave power for more slave states, which was the Mexican struggle of the '40's. There has indeed been no chapter in contemporary history more creditable to the United States than our reluctance in the long months past to lend ourselves as a cudgel to aggression, in the way that the British government lent itself to the mining interests of the Rand. The President's recent lofty plea that we "should exercise the self-restraint of a really great nation that realizes its own strength and scorns to misuse it," had its four-square response in the short and vigorous speech of a long time civic leader of Chicago—Congressman William Kent, of California. Although his private interests in Mexico would be enhanced by a war of conquest, he has steadily set his face against hostilities, and was one of the few congressmen who opposed the resolution authorizing the President to use force against Huerta:

"This resolution means war, and nothing short of it. This is no declaration of peace. This is not a declaration against one man. It is to every man who knows Mexico a declaration of war against the whole people of Mexico, and nothing else, for the moment we put armed forces into Mexico, all the forces of racial antipathy, all the old historic struggles will be revived, and we shall find that we shall have to take the country and rule it. . . . I believe as firmly as I stand here that by voting for armed intervention in Mexico we are condemning to death many of our own citizens who, without the passage of this resolution, would live happy lives."

WE have become used to demanding a social content in the public programs that command our enthusiasm. Such a social content would, conceivably, characterize a policy of federal intervention in Mexico on practically the same lines that a policy of federal intervention in Colorado might be proposed and defended, namely, that in both cases the underlying causes are economic, that they spring from the anti-social policies of absentee capitalism and that that capitalism in both cases is predominantly American. If a sore distraught people rose and threw off the old Diaz régime—and have resisted its reassertion under Huerta to the extent of plunging the country into anarchy, has it not been because of the policies of exploitation in mines and plantations, which have advantaged American speculative capital? If our forces for economic depredation transcend state and national boundaries until civil government within them breaks down, then a reasoned argument can be put forth for the moral forces of the nation to use as long a reach, employing the federal arm not only to restore law and order, but to set up a fabric of justice where we have wrought injustice.

In a similar way, the conception may be advanced that the United States is champion of democracy and constitutional government in the New World, that we should brook no government by assassination, no autocracy under whatever guise, in the political life of the western hemisphere.

This apparently has been the New World vision of Mr. Wilson; and his coherent policy of watchful waiting and crowding Huerta to the wall has been built upon it. The bottling up of seaports and the embargo on arms while the constitutionalists bore their way to the capital are consistent with its larger strategy. But unless President Wilson was aware of resourceful elements in the Mexican situation of which the average citizen knew nothing, he was taking a stupendous risk—a risk which clearly meant war if it failed—in attempting to advance this policy by the moves at Tampico and Vera Cruz.

For there is that second proverb of the camel. If we let the nose of war under our tent, can it be otherwise than that the whole brute will crowd after it?

WITHOUT such a social program as those cited, war, whether we are provoked, or blunder into it, or set about it purposefully, is intolerable between a great nation and a weak and distraught one, between the rank and file of the people of both nations, who have no quarrel with each other, but who must bear the withering scourge of loaded guns, however many thousand times, before or after, the empty ones go off to acclaim dignity or victory.

WITH such a social program, what assurance have we that war would after all bring the social gain desired? That it would not pile up a social loss more than counterbalancing any conceivable gain?

THERE has been no more searching challenge to the American people to think this outcome through than that of Norman Angell, editor of the Paris edition of the London *Daily Mail*. The author of *The Great Illusion* was in New York the day before Vera Cruz was taken, and in an interview asserted that once interference began in Mexico we could only expect that the political momentum of the thing would sweep us along until we reached the Panama Canal. That would mean, he held, the attempted absorption of from twenty to twenty-five million alien people, ignorant of our language, laws or civilization, with the result that this country would have an Irish question on its hands. "Meaning," said he, "that for a generation we should be occupying ourselves with these questions at the expense of the welfare of the people of the United States."

Using as his text the remark of a famous German general that "You can do many things with bayonets, but you can not sit on them," Mr. Angell went on to interpret the social significance of the fact that since the days of the Norman conquest, permanent holding of territory by military means has become cumulatively difficult. To quote:

"It is important to realize something of the factors which in our generation have so developed as to render the social and moral possessions of a people, that thing which we call nationality, indestructible. . . .

"We cannot confiscate the land of a conquered people in our day, nor tear up titles to property, nor reverse the decisions of their courts, because if we did we should find that our banks or insurance companies or business men were in some way interested in the security of such titles to property, and that banks had advanced money on the mortgages to such property, using, it may be, the money of insurance companies in which the citizens of the conqueror are insured. . . .

The Normans could impose their own language and courts, because the existing population of England practically had no written language; that is to say, that the population as a whole had no books nor newspapers nor correspondence through post offices, nor telegraph nor courts of law, no debates in city governments nor city records, nor state parliaments; no theatres in which they had plays in their own language, nor schools which had solidified the language, nor literature which they loved. . . .

"But to-day, even in a case like Mexico, you have all these things in lesser or greater degree. You have the intangibility of the foundations of national wealth. That is to say, confiscation of property is impossible; which means that the mass of the people guaranteed in the security of their ordinary possessions can effectively resist administrative measures designed to break their national habit in the way of language, customs, etc.

"The Germans have made this discovery even in provinces which they have held for half a century, like their Polish, Alsatian, and French provinces. The German government sets out, for instance, to stamp out the Polish language, and attempts to compel the Polish peasant to send his child to the German school, instead of to the Polish one, and compel the parent to have his children say their prayers in German. Yet the Polish peasant, knowing that he cannot be turned out of his land, and that his livelihood is secure, continues to send his child to the Polish school and to teach him to say his prayers in Polish. Germany cannot dispossess a whole population. The outstanding fact of German administration in Polish provinces is that German domination has failed."

COMPARING the present situation with that before the Boer war, and noting the fact that since then Great Britain has granted self-government to the very people she conquered, Mr. Angell went on to bring out the social consequences to ourselves of such a process.

This phase of the situation was put by former President Taft in an address to Yale students. His words were cited by the New York *Evening Post*, one of the most vigorous and earnest supporters of President Wilson, but before that and always a militant for peace—as may be judged by this quotation:

"War means not only the sacrifice of life and treasure; it means the piling up of taxes, with their burden crushing those least able to bear it; it means speculation and dishonesty and fraud, with the brutalizing and corrupting of the whole conduct of public affairs; above all, it means the subordinating of every other public question, and the indefinite postponement, or entire sweeping away, of all program of civic betterment and social reform. That nothing of this lies in President Wilson's purpose is conceded; but he must know, and if he does not he will speedily ascertain, that a real war with Mexico would make his Inaugural, with all of its moving words about the need of broad policies of legislation in behalf of the victims of political and social injustice, so much waste paper."

THERE is still another parable of the camel. As this issue goes to press, it would seem that even if the great gates of peace are closed, there remains a chance, on our knees, as it were, through the needle's eye of mediation, for America to enter. Uncertainty shrouds the factors that determine Mexican action, but on this side the border three things are propitious—the anti-jingo sentiment of the people, for which we have President Wilson perhaps more than any other man to thank; the reluctance of Congress and President alike to loose war; and the rare intuition and mastery the President has displayed in other emergencies.

A BLACK chapter in English history is the tale of the long struggle of the British shipping interests against the Plimpoll line. This is a line on the hull of every sea-going ship to mark the danger point in loading. Ships over-insured and overloaded had long been sent to their doom from English ports. Yet when a bill was introduced into Parliament, prescribing this self-evident safety line, every device known to the shipping interests of the greatest of maritime nations delayed its passage many years.

The International Convention on Safety of Life at Sea, better known as the Treaty of London, drafted under guidance of those same British shipping interests and now awaiting ratification by the President and the Senate, appears to have been named in a spirit of irony.

The same influences which delayed the Plimpoll law, have presided over the conference from which the treaty emanates. It behooves those who learn from the past the stern lessons of experience to examine critically every proposal relating to human life which issues from the

source of the international convention. In several important points the treaty relaxes safeguards already provided by the laws of England and of the United States.

The English law provides, for instance, lifeboats for all persons on board; the treaty for only 75 per cent, the remainder may be provided for with rafts. Our present American law requires continuous wireless service with two certified operators on steamers plying between places more than 200 miles apart and carrying more than 50 persons. The treaty reduces this so that only fast vessels in the inter-continental trade are compelled to have wireless operators keeping continuous watch.

Our courts have held that a crew is inefficient for service either on the vessel or in lifeboats, if the men cannot understand the orders of the officers. The treaty provides merely that certificated lifeboat men shall be "capable of understanding and answering the orders relative to lifeboat service." This provision permits the rest of the crew to require interpreters.

Under the treaty, lifeboat men may be drawn from the saloon, the deck, or the engine department. The La Follette bill requiring at least two men of the rating of able seamen or higher passed the House during the last Congress and the Senate this year, and is again before the House. Ratification of the treaty would establish the lower standard, for an international treaty supersedes a national law. More, the treaty if ratified will remain in force until 1921. During seven years no progress in the direction of safety at sea can be made by any of the contracting nations. We shall be at a standstill, worse off, in some respects, than we are now.

MR. Rockefeller is of the younger generation. His is the disability of making decisions at a distance, which has spread with the spread of absentee capitalism in this country in the last 50 years. He has the further handicap of not sharing first-hand in the work-a-day experience of the times, in the way that the earlier builders of our industries shared in it. Therefore, we expect his generation to overcome these limitations by a further flung imagination, a sounder technique, a keener appreciation of human kindness, and an insistence upon competent agencies of information before they venture or confirm social policies which affect the lives and well-being of thousands.

In its March magazine number *THE SURVEY* published a remarkable letter from Major Henry L. Higginson: Consider the Other Fellow. Its plea was for understanding for the industrial enterpriser. It may or may not be true that these last desperate encounters in Colorado are, as the newspaper reports have said, the direct result of a feeling of desperation on the part of the men, in view of Mr. Rockefeller's statement at the congressional hearings that he would rather lose all his millions invested in the coal fields than recognize the unions there. But it is certain that his testimony has done more than a thousand agitators to augment that bitterness which Major Hig-

ginson, from the vantage point of eighty years, so earnestly deprecates.

The editor of *THE SURVEY* is far from agreement with certain positions taken by Major Higginson. The issues he raised are not of the sort to be settled over night. Rather than essay editorial comment, the larger more constructive thing seemed to be to provoke just such free and open discussion of the issues raised as has marked the score and more letters published pro and con in response to Major Higginson's communication. It seems worth while to bring out at the close of the discussion—and especially at this juncture—certain of his original points, so as to leave a clearer impression of them than apparently exists in the minds of some of his readers.

I. What he asks is that the capitalist should be treated as human and therefore entitled to human consideration. He asks this chiefly because of the effect upon the workingman. So long as we have our present system of industry it hurts the workingman to make investment unsafe or odious, and so lessen its amount and the amount of work and wages it affords.

II. Mr. Higginson asks for the exercise of kindness, friendliness, charity, pending the establishment of justice, not because he prefers kindness to justice, but because we have not yet arrived at justice in industrial matters and are not even agreed upon what justice demands—as the answers to his article fully illustrate. Industrial justice will not be established next week or even the week after. Meantime we can at least be human—even to the capitalist.

III. Many of the answers to Mr. Higginson's article indicate a belief that the present capitalistic system should be abandoned or radically changed. Mr. Higginson himself seems rather to believe that it should be not so much revolutionized as humanized. But whatever may be the truth on that matter, it does not affect the contention that meantime those in responsible positions under the industrial system which we actually have should be treated in a human way. Nor will the soundness of Mr. Higginson's counsel in this matter be affected by any change in our industrial system. The same human attitude, toward capitalists or any others who take their places under any industrial system whatsoever, would continue to be both honorable and necessary to carry success, financial or superfinancial, long after the present generation and the present system have disappeared.

IF that larger human understanding is to come from the public, what of the larger human understanding on the part of the capitalist? Time and again during Mr. Rockefeller's testimony before the congressional committee, the question of his knowledge of and social responsibility for conditions not in the vice districts of the cities, but in those mining communities where the Rockefeller interests dominate, was put from one angle to another. He admitted quite frankly that he had not been in Colorado for ten years, that he had not attended a directors' meeting in

that length of time, that he did not know the wages paid the Colorado miners, or the rent charged them in the company houses, or whether they could ever acquire a title to their own homes, or what profit the company made out of its stores, or whether it had bought any guns or ammunition. He had not personally talked with any miners, and their conditions, so far as he knew, had never been the subject of correspondence between himself and the officers of the company.

On the yea or nay of this one man, so informed, has hung the issue this week of struggle or negotiation, of life or death, affecting ten thousand other men.

Mr. Rockefeller defended his stewardship—with every evidence of sincerity—by stating that his policy was to test and choose the best men he could find and then back them up; that he was used to acting on the reports of trained men in whom he had confidence; and that the responsible executives of these companies in whom he had such confidence had reported that 90 per cent of their men did not want unionism, and that the strike was without a just foundation.

With the burned bodies of women and children in the pits at Ludlow, let us not stop to argue the question of whether or not men who are willing to stake their livelihoods, their lives, and those of their wives and children in a cause they feel to be just, want to have some say and government over the conditions of their work.

Let us challenge the sufficiency of the judgment of an operating official as to his works, in the same way that the Rockefeller philanthropies would challenge the sufficiency of the judgment of a police commissioner as to his scheme of regulating the social evil, or the judgment of a college president as to the educational value of his courses. Mr. Rockefeller would listen to such judgments, weigh them with other evidence—knowing them to be the notions of fallible men on the things they are most interested in; but he would rest his decision on the findings of trained men, outsiders, who had nothing to do with the policies under review, who were not asked to pass on grievances against themselves.

Mr. Rockefeller has such trained men in his group of social observers. He could turn to George Kneeland, who lifted the lid of the red light district of Chicago, and whom no powers of the underworld led to swerve one hair in telling the exact truth. He could call on Raymond V. Fosdick, who unearthed some of the most powerful crooks and grafters in New York's political life and ousted them from office. He could call on Abraham Flexner; there is no more tempered, incisive mind than his in the whole field of social exploration.

Mr. Rockefeller knows, we know, these men can see with free eyes, keen eyes, true eyes. He knows, we know, that if he commissioned them as trained men to go to Colorado they would get at the exact facts in this situation where not honesty but industrial policies are at stake. He knows, we know, they would have the courage to tell what they saw and found.

"BEAUTY FOR ASHES"

[Continued from p. 156.]

seemed providential to me that, as the program showed, they were to have a round table on housing. I attended, solely for that meeting and to talk with the housing experts who would be there.

I can never forget the feeling of infinitesimal smallness that overwhelmed me when I asked my first timid question, at that round table. Dr. Walter Lindley, who presided, lifted my question, with great kindness, out of the vast silence. Then E. T. Hartman, of the Massachusetts Civic League answered it in an illuminating speech. Later he gave me an hour of patient answers to eager questions, which I set down in a note book.

How little I knew, and how much I had to ask! I went away with a new light on legislative methods, and with a list of books and pamphlets on housing to read, also much other information that made me feel rich indeed.

National Backing

At this conference I again met Mr. Grout, and he advised me of the investigation his organization was making into the housing conditions of Indianapolis.

"The Commercial Club are taking part in the investigation, and are looking about for a suitable housing ordinance," he said. "I advise you to get in touch with them and interest them in the movement for a state law."

Home once more, I rushed off letters hither and yon, for laws and books and pamphlets.

First, I wrote to Jacob Riis. Then and later he sent me letters of such cheer and encouragement that I have kept them to inspire future generations. Our family has always understood that if the house should take fire they must save the twins first, and then those letters.

Mr. Riis gave me some sound advice, and then referred me to Lawrence Veiller, as "the one who knew all about housing laws." It was long afterward that I learned that Mr. Veiller was the author of the New York tenement house law of 1901 and knew of his yearly battle at Albany, where he has fought through legislature after legislature the steps that were necessary to perfect the New York law. Some day our country will appreciate that this long war has been for the homes of the nation as was the Battle with the Slum, fought so nobly by Mr. Riis.

The National Housing Association was not yet formed, but Lawrence Veiller answered most generously my appeals for information. Absorbing as much as I was able—for housing intelligence comes gradually—and following along as well as I could, at long distance, I set about the drafting of a state tene-

Washing With Air

There are two great natural cleansers—water and air. The modern housewife is now learning the possibilities of the second of these elements.

We have harnessed air—intensified its cleansing power—and now compel it to draw away every bit of dust, dirt and other accumulations from *under, in and around* carpets, curtains, walls, furniture, bookcases. Every room is cleaned, freshened, sweetened, *washed* by the steady suction of the

Western Electric Sturtevant Vacuum Cleaner

Simple, powerful, permanent. No complicated mechanism to wear out or break. Light in weight. Cannot injure the article or surface cleaned. Costs only a few cents an hour to run. There are several sizes, both portable and stationary, intended to meet every need of home, apartment and hotel. Prices range from \$47.50 to \$400.

To know the possibilities of this cleaner and its adaptability to your home, write for a copy of our illustrated book, "The Clean Way to Clean." Ask for book 17-AZ. It will be sent free.

ment law, which should be "not too long," and yet contain all the vital elements of the other laws in our country.

If only Mr. Veiller's model housing law, or even his model tenement law had been written then, what work and worry it would have saved!

The Law Drafted

Finally, with some changes, I settled on the parts we had taken for our Evansville ordinance. Mr. Igleheart went over it, and saw it was "air tight and water tight," and the draft was ready to submit to all the tests that practical business men would apply to it. It got them!

One other detail, not to be neglected, was the examining of the Indiana statutes, to see that we had not already some law on the subject.

I determined to satisfy myself on this subject, so as to be sure that no obscure enactment would be overlooked. So, repairing to the law library at the court house, I scrutinized every page of index and hunted down, with finger on line, every word that might conceal a multiple dwelling in its content, and assured myself that Indiana would have nothing to say if her tenements were built fifty stories high, without a single window in one of them.

It came to me with something of a shock that the poor in our state had no legal right to light and air; in fact, no tenant had, only those persons who owned enough ground to insure light and air to their dwellings.

The next step was to get sufficient proof of the need for the law, in a form that we could present.

With no organization, and no funds, a scientific survey of the towns and cities of the state was, of course, out of the question. But I knew Evansville by heart. Indianapolis was making its own survey, and we must simply get the best information we could in regard to the other cities. The best I could do was to send a questionnaire to all the charities secretaries in the state, asking certain facts about the housing conditions in their towns, for minute descriptions of a number of their tenements, and photographs of their slum quarters. The charities secretaries entered heartily into the campaign. They appreciated, more than any one else, what bad housing meant to the poor and gave then, as they are still giving, the best support that housing reform has.

The State's Needs

All the larger cities, most of the towns, and many of the villages contained slums. There were whole slum villages, where miners lived, or quarrymen, in "company houses." There were little settlements and suburbs of shanties and shacks, where the poorest lived. The worst one was a shack settlement for rag pickers, built on the dumps,

From small beginnings in 1810 the Hartford Fire Insurance Company has, in 1914, reached its present preeminent position in the fire insurance field. Its steady growth in strength has been unretarded by the enormous losses it has paid to its policyholders both in the great conflagrations of American History and in those small but per-

sistent losses which occur somewhere every minute of every day and night.

Willingness to adjust losses fairly, ability to pay fully and readiness to pay promptly are the three great fire insurance virtues and they are the explanation of the "Hartford's" growth and prosperity.

Equipment of Playgrounds

A public playground is intended to cultivate correct physical and moral development, and supervision and the right kind of equipment are equally important.

Apparatus well planned economizes in space and affords the best way to provide for a large number of children.

We have accumulated a mass of data on the subject of playground equipment, and we are glad at all times to assist in planning equipments without obligating the prospective purchaser in any way. A very efficient equipment can be obtained at a moderate expenditure, when economy is necessary, if properly planned.

where the people ate garbage, and degradation was extreme.

In certain parts of the state the immigrant problem made desperate complications. Mill workers, coming in hordes, lived in herds. Day shifts and night shifts used the same beds. "Hunyaks" were crowded together, twelve to twenty in two rooms, kennelled like beasts, in dark, filthy rooms, stifling with foul air, without water or any of the decencies, —and paying three prices for sub-let rooms, that was the worst shame of it.

Some towns had a startling number of dark rooms. The Indianapolis survey showed 1,100 within a radius of a mile. But little towns that were building handsome flats and were even called "model cities", had dark rooms in these flats.

With few exceptions, the towns of the state gave their poor no water, drainage or sewer connections. All housed the poor in their worst old shacks, hovels, tenements, warehouses, stables or sheds. There was the same tale of unsanitary conditions everywhere, wet, mouldy cellars, damp floors and the rest.

But why should I go into more detail? These conditions are the common scandal of all our states, and if any one who reads this chapter will start in a straight line from his city building, in any direction, go a few blocks, and turn up the first stairway leading from the street, in any solid row of buildings, he is pretty apt to find some surprises in the way of living conditions. Or, let him go down some of the alleys in the business blocks, and further out, about the ragged edges of the town. Our photographs could be passed around in any company, in any city, and very few who would see them could say that they were not taken from some of their own back streets.

We had plenty of proof that the time was "ripe for a tenement law," but we had to have something to show to the Legislature in proof of Evansville's condition. Nothing is so conclusive as photographs, and I ransacked the city to find the worst houses.

Dr. M. A. Farr, our Methodist minister, a member of our housing committee and one of the friendly visitors, was an expert photographer and he, too, knew these places by heart. He got some "speaking likenesses"—strong language they would have spoken, if they could. Then I took my whole collection, from all the cities, mounted them on large cards, and put sketches and suggestive titles, in ink, on the margin. Over one old death trap I put a great skeleton, with arm outstretched over it, and the words "Death keeps watch over this house." Five black coffin shapes were stood in a row beneath a house that had a record of five deaths from tuberculosis in a short time. I drew a black devil peeping out from a saloon that had families living

San Francisco Relief Survey

A striking study of the organization and methods of relief and rehabilitation after the disaster of April, 1906. It includes the results of a Study of Rehabilitation and Some Lessons of the Relief Survey.

The book is statistically ample and sound. It is also a thoroughly readable and moving story of months of work by the social workers of the country in co-operation with the Army and the tireless citizens of San Francisco.

It shows devoted men and gently nurtured women sheltered in shacks, cooking their army rations over splintered shingles on a curbstone, gathered about a single candle and conspiring successfully together to raise San Francisco from her ashes. It is the sort of history that one day shall displace the war books.

over it. It made a very striking set of posters.

No reports were available from the little towns and one August morning I started off on a traction line, going to the end and stopping off at every place on the way back.

It was an odd experience. Some towns had only one street, along the railroad, but there was hardly one in which patient search would not find one or more typical slum dwellings, at the end of the row of houses, or hidden back in the brush. Sometimes it was a cluster of hovels, sometimes a tenement, off by itself, "a ragged beggar, sunning," swarming with people, and with conditions that would make a New York tenement blush.

These various lines of work had occupied most of the summer. At the same time I read everything I could get on housing. Then I went back to Jacob Riis' books, to get the spirit of his prophecy. "Fifty years ago, the slums of New York resembled those of our larger western cities today," he tells us, with the warning, "Head off the slums!"

A Vision of Need

There came to me a vision of my state, as though it were spread out before me, with its rapidly growing cities and pretty little towns. In fifty years those black slum spots we had found would have spread beyond all control. The land would grow in value, speculators would be crowding houses in on side and back yards, spoiling the beauty of the streets, and shutting out the sunlight and air for all time. Once built up, space is rarely retrieved.

And in the larger cities—my heart sank at the thought! In fifty years *we* should have horrors of congestions, of decay. The cancer spots of slums would have eaten out the hearts of our cities, and their poison would have run through all their arteries.

It is only six years since then, but in that brief time I have seen some of the things I feared come to pass in our unregulated towns. In the two for which we obtained our first tenement law, the enormous increase in tenement building, and our experience with a few land owners, shows what would have happened if no limit had been set to crowding.

With every book I read, with every report and photograph that came in from our towns, the vision became more vivid. It lay spread out before me—my state, dotted with growing towns, set in such a vastness of field and forest that crowding seemed criminal!

At night I lay sleepless, the darkness thronged with faces I had seen in our tenements, multiplied, repeated, "even as a broken mirror" multiplies. There were burning eyes of the consumptives, hopeless faces of the mothers, and white,

moaning babies. And these were no images of fancy, I had known them by name, here in our own city. And all the other cities and towns had their poor! What would they have in fifty years?

What was the immolation of one life, to all that misery? One could have dashed it down cheerfully to save all that, as men do, fighting for their country.

The Call to Service

There sounded a bugle call, to take up arms for my state, and every power of my being leaped to the summons. The call of one's country, the call of humanity—they are both the call of God. Henceforth, wherever that voice led, I would go.

There need be no frenzy, no cant, about a special "mission." The air is ringing with calls. If only a few hear, the few must answer.

"Do you think that no one else could have done that work but you?" remonstrated a friend. "Someone else would have done it if you had waited."

"Someone might have done it, but no one had, and no one was offering to do it, and I couldn't wait," I answered. Sometimes I marvel at the way it all came about, that steadily and without one moment of hesitation, every step was taken that was necessary to prepare the way for a tenement law. The strangest thing about it was that the way seemed mapped out and decisions made for me, and that, almost without volition, I seemed to be not led, but moved, by a great Hand. Under a fearful tension of work and responsibility, night and day, for months, I have never known a time when thought was so clear and so unflagging.

Even the decision to do all that was necessary to secure a state law seemed less a decision than a growing knowledge that I was to do it. I did not know what this would involve, but I knew it meant the encountering of great obstacles, a stupendous amount of work, and active opposition. But it never once entered my mind that I should have to go to the Legislature. My part, I supposed, was to lay the foundation and prepare the way.

Realizing that housing reform was a new thought in our state, and that the responsibility of the landlord was an unpopular as well as an unfamiliar doctrine; realizing, from my years of charity work, how few people knew the actual misery of the poor, I set about a campaign of education. My one overpowering desire was that everyone in the state should know, feel and care, should see the wrongs and understand the remedy. "PUBLICITY" was now my one care. What can we accomplish without it in such work?

The press of the state responded nobly, and with that prophetic ken I have re-

marked before. Others sometimes miss the spirit of housing reform, but I have never seen an editorial in our state that failed to rise to it. The presidential campaign of 1908 was on, and the papers were congested with politics, but all the grist I could grind out was given space and good, strong comment.

The endless part of my task was the personal letters that simply had to be written. Of course, nothing could take their place. I wrote hundreds, and if I had known more people to write to, I should have written more. Business men's clubs—first of all the Commercial Club of Indianapolis; women's clubs, civic organizations, all had to have careful letters. Prominent men and women had to have individual appeals, suited to each. It was an endless task, for circular letters would not avail. How I thanked my uncle for his training, and how I appreciated my typewriter, that gave my epistles more hope of missing the waste-basket!

Click, click, click, click, click, went the typewriter, from June till January, all day from morning till twilight, with stops only for household cares or for the children. They played about me or sat as close as possible while I wrote, with little arms about my waist, and I could work better with them near. Stopping now and then to tie a shoe, find a string, or get a lunch gave breathing places, and rest for tired eyes.

I am asked, "Why could not a secretary have saved some of that work?" In a city of our size? A mother and housekeeper doing so much public work that she had to employ a secretary! That would have been a scandal, indeed, almost as bad as to have an office!

After my morning tasks were done, the meat and groceries ordered, the meals planned and the day arranged, my grind of letters began, and went on till noon; after lunch and a brief rest, writing again, till sunset; after the children were in bed, more work on articles, some times till midnight.

Sitting at my desk by the window I thought of the factory girls, and the children shut into close tenement rooms while summer called and the trees beckoned. Oh, for a day in the fields and woods! But if I stopped, even for a day, my work would lag. Answers to my letters, with many questions, were pouring in, and a mountain of correspondence was daily growing higher. And it was no worse for me than for those others, shut in from the sunshine. If this work could only win it for them!

Dog-days came, and the thermometer boiled up near the top, but the pile of letters grew steadily. With all our airy rooms, and spacious lawns, verandas, baths, ice, electric fans, we were sweltering. What must it be in those stifling thermos jugs of rooms, with the foul odors intensified by the heat?

New International Encyclopædia SECOND EDITION

The first volumes are being distributed; others will follow shortly.

The alert manufacturer supersedes his costliest machinery with more efficient tools. So must you, if you would be abreast of the times, discard your adequate encyclopædia of yesterday for the later and better

Encyclopædia of Today

Demand for latest authentic information is insistent. The great Second Edition of the New International Encyclopædia will be the supply for this demand.

Lateness and Comprehensiveness

It will contain a mass of important material not accessible in any other encyclopædia, the nature of which is suggested in the following

PARTIAL LIST OF EXCLUSIVE FEATURES

HISTORY: President Wilson's administration; the Mexican difficulty; the Balkan War; China with republican government; the amazing developments in Ulster; recent political life in South America; a wonderful article on Alaska; a splendid Semitic article, etc. The necessary new maps (in colors). Latest explorations and discoveries (North and South Poles, etc.)

STATISTICS: Complete returns of latest censuses throughout the world—trade in all countries, agriculture, education, mining, manufactures, revenue and expenditure, banking, including Postal Savings Banks, etc.

ENGINEERING: Panama Canal, Cape Cod Canal and others; New York-Catskill Aqueduct, Los Angeles Aqueduct; Cape-to-Calro Railway; new railways in British Columbia; new bridges; Inland Waterways project; Panama Exposition buildings and others; fire-proof construction; advanced marine architecture; irrigation; latest steam turbine, etc.

LATEST RESEARCHES: In chemistry (corpuscular theory of the atom, new gases in the atmosphere, radio-activity, colloidal chemistry, etc.); medicine (radium in the treatment of cancer, serum therapy, etc.); in surgery; in osteopathy; in archaeology (new frescoes from Tiryns Palace, Wace and Thompson discoveries in Thessaly, especially the Neolithic culture); in mechanics, philosophy, philology, psychology, (series of articles by Prof. Titchener; anthropology (Ancient Types of Man, by Prof. Duckworth, Jesus Col-

lege, Cambridge, England; Tribes of the Philippines), etc.

ECONOMICS: The new Tariff, Banking and Currency Laws; Income Tax; Trust legislation and prosecution; agricultural credit; electoral reform; Ben Lindsey on Juvenile Courts; arbitration (Industrial and international); Trades Unions, strikes, lock-outs, workmen's compensation act; child development and diseases; child labor; women in industry; minimum wage; pension for mothers; old-age pension legislation; welfare work; conservation; eugenics, etc.

ELECTRICITY: New theories of electricity and matter; electrification of steam railways; latest developments and uses of wireless telegraphy; wireless telephony; electric furnace work; nitrogen incandescent lamp; fixation of the nitrogen in air for fertilization of soil; curative radiations.

BESIDES: Latest progress in aeronautics, in automobile manufacture; latest inventions, manufacturing processes; new industries; railway safety and progress; safety at sea; latest military and naval practice and equipment; new educational methods, including Montessori system and the Wisconsin plan; medical inspection of schools; wild life or game protection; hundreds of new biographies, records of sports of all nations; Christian Science; items of latest interest in law, drama, painting, sculpture, religion, literature; the peace movement; the parcels post, etc.

THOUSANDS OF ORDERS

Contents and Characteristics

New type throughout. 22 volumes (about an inch thick) of matter and an extra volume, "Courses of Reading and Study," covering about 18,000 pages. About 75,000 distinct articles. The same careful editorial methods that distinguished the first edition will characterize this second edition. Separate maps (in colors) of all countries, states and important cities; hundreds of full-page half-tone engravings and thousands of cuts; over a hundred full-page color-plates (ten or more printings). Printed on special University Bible Paper (thin, light, tough, opaque.)

The leaves on the bough by the window turned sere and dropped away.

The birds deserted the bough, and finally snow came and covered it.

But still I sat by the window and wrote. Each month the strain grew more intense, for the Legislature was to meet in January.

One by one, I had given up all forms of recreation. Reading had been cut down to housing literature. Society was abandoned, and even my best friends complained of my neglect. Outings had long since been given up, and finally, all outdoor exercise, except a little walk just before dark. Just in time to see the sun go down on our beautiful river I would throw on my wraps, and hurry down to the avenue from which the pageant of the sunset could be witnessed.

Travelers tell us that the sunsets on our river are unrivaled. Always different, they were always wonderful—the crescent of the city, the long loop of the river, with willows above and hills below, the Kentucky shore on the other side, a strip of woodland and broad sandy beach. Shoals in the river, and a little breakwater, made lines of silver on the glowing mirror of its depths, or flashing ripples. And then, the color! Sometimes a blue haze wrapped the farther shore, sometimes a silver veil trailed over it and rose from the misty water, dim as a point of Dreamland. At such times the city, below the wharf, was a blur of soft colors, growing fainter toward the hills.

When the red sunsets of winter came, the town turned aside to see them. It was life-giving to stand and drink in the pure air blown over miles of river and cornfields, and watch the delicate flush recede from the zenith gathering slowly into an ever-deepening glow about the sinking sun. Then the river was tinged with "dragon's blood," the children said, watching with me until the glory died away from sky and water, changing from crimson to ashes of roses, darkening and dimming until the purple shadows folded in river and shore. Lights flashed out along the river from the boats and the town, but still we waited for the one star that came out and trembled over the water with a message of hope and courage and beauty yet to be set above all the city's blackness.

That one glowing hour was an antidote for the gray reeking sordidness I had been writing of all day.

The State Conference

In October, the State Charities Conference met at South Bend. I was on the program for a paper on The Housing Problem of Indiana, so thither I took my draft of the tenement bill.

Traveling almost the entire length of our state, I was impressed with the vastness of domain, with the contrast between the prodigality of our uncultivated

The Education of Karl Witte

or The Training of the Child

Translated by Professor LEO WIENER and edited by H. ADDINGTON BRUCE

800. \$1.50 net. By mail, \$1.65

"I do not know of any book on education that has yet appeared that interests me more, or that ought to be of more interest to every parent and teacher. I am profoundly convinced that there has been something radically wrong in our understanding of the development of the child mind. I am certain that its marvelous possibilities are poorly appreciated and have never had a fair chance. It is the heritage and right of the child to have parents and teachers who know how to enable him to make the best use of his God-given faculties. We are under lasting obligations to Mr. Bruce and Professor Wiener for bringing the marvelous account of the education of Karl Witte to the attention of the American people."—JUDGE BEN B. LINDSEY, *Juvenile Court, Denver.*

SITUATIONS WANTED

CAPABLE, conscientious woman. Head of Settlement. Twelve years in social work. Seeks connection—willing to leave New York. Address 1250, SURVEY.

COLLEGE GRADUATE, two years' experience in Y. M. C. A. work in city of 100,000 desires position by June 1st in Social Public School Center work. Address 1252, SURVEY.

YOUNG WOMAN wishes to assist in case-work or investigations. C. O. S. and parish experience. Address 1255 THE SURVEY.

SOCIAL WORKER with experience in responsible positions with boys and men desires position for the summer in boys' camp. Best references. Address 1256, SURVEY.

WOMAN, normal school graduate and practice school teacher, with several years settlement experience, knowledge of and capacity for executive work, desires engagement for the fall in New York or Philadelphia settlement. Address 1258, SURVEY.

HELP WANTED

FINANCIAL representative for charitable institution of Michigan. Must have proven efficiency. Address 1249, SURVEY.

WANTED

SUPERINTENDENT OF NURSES,

Dispensary Department, Chicago Municipal Tuberculosis Sanitarium.

At present 10 Dispensaries—40 Nurses, Unequaled opportunity for a Nurse of broad education, good training, experience and administrative capacity. Salary \$1920 to \$2400 per year. Civil Service examination (local residence waived) will be held in Chicago about the middle of June, 1914. For particulars apply to General Office, Municipal Tuberculosis Sanitarium, 105 W. Monroe St., Chicago.

WANTED—Settlement Assistant in city of Central Eastern State, able to supervise classes in cooking, housekeeping, sewing and manual training. Must have experience and executive ability, good health, good temper and enthusiasm. Address 1257, SURVEY.

lands and the miserly pinching and squeezing of our city spaces. We rode for hours through woods and fields, and whizzed through towns that seemed only a smoky blur on the landscape.

Space—space, that was the one great, vital need of our cities and towns, the need to save it before land became more valuable than people!

Riding past villages, through little towns, along miners' settlements, I had disheartening glimpses down into the cindery strips of back yards along the tracks. There was time to note the blackened sheds, the dingy rows of houses, jostling each other almost on to the track; time to note the dirty children, who climbed up the ash piles and heaps of rubbish to wave to us.

As town after town passed, a feeling of gloom settled over me, and the hopelessness of redeeming all these waste places seized upon me. But once in the conference, in the midst of good friends, the outlook brightened. There were plenty to offer encouragement and cheer. Francis H. McLean was there, and went over the bill with me, making some valuable suggestions. He took my paper, after it was delivered, and published it in *Charities* (now *THE SURVEY*) just in time to help in our campaign.

A committee was appointed to go over the bill, and then the conference voted its approval.

There was a brilliant reception at the close, and new friends were made, who are now old and dear.

"I have an invitation for you," said Mr. Grout, as the evening closed. "The educational committee of the Commercial Club invites you to meet them at luncheon, as you return home to discuss your housing bill. Your friend, Miss Foster, is included in the invitation."

Good news! It sounded hopeful.

The next day Miss Foster and I arrived in Indianapolis, and appeared in due time at the Commercial Club. We were taken to the director's room, where luncheon was served, and there we found about a dozen all ready to greet us, others of the committee arriving later. There were lawyers, bankers, editors, doctors, all prominent men.

So much depended on the outcome of that meeting, and I was so entirely in the dark as to how the committee felt disposed toward the bill, that I was rigid with a tension that came near lock-jaw. I remember afterwards, the well-appointed table to which we sat down, and the fact that many tempting dishes were served, but I could not recall anything that came after the soup.

My letter to the club, Mr. Grout had told me, had won by being practical and business-like. Fearful of spoiling that impression by some unguarded word, I held on to myself as one riding a bronco down a steep mountain path. I remember checking myself in a de-

scription of the conditions of the poor, for fear I should verge on sentiment. If anything makes it difficult to maintain a lofty dignity it is to sit in chairs built for great men, conscious that you can't reach the floor. I've always noticed how much more easily impressive are large people, with the stately step of avoirdupois, the judicial aspect of massive cheek and chin, the big voice that goes with physical strength, the force of ponderosity! But so kind were my hosts that I forgot these things.

The luncheon and our session lasted three hours. After the last course the bill was laid upon the table. I trembled to see sundry crosses and question marks on the margin. One by one, each doubtful point was discussed, and I was called upon to explain just why it should be so and not otherwise. It was like being on the witness stand, with a dozen cross-examiners—keen, though so kindly. Surely my good angel stood beside me and told me what to answer, for at the end I had the satisfaction of seeing every question mark erased.

The committee expressed its satisfaction with the bill, but they asked if I would go over it, word for word, with a sub-committee, before they gave formal approval. Would I stay for such a meeting? Would I!

That night Miss Foster and I sat down again at the long mahogany table with Professor Dunn, Dr. Hurty, secretary of our State Board of Health, Mr. Grout, and Linton A. Cox. Mr. Cox was a lawyer and real estate owner and one of the most active members of the club, also a hold-over member of our senate.

I realized that his interest in the bill was very important, but none of us dreamed how much it was to mean in years to come to the housing movement in Indiana.

For three hours, again, we went over the bill, considering every word, every comma. At the close of our conference I was told that the full approval of the committee would be given to the bill.

"Then, gentlemen," I said, with unconcealed delight, "if you approve of this bill and it is what you have been looking for, let it be the Commercial Club bill, and let me leave it in your hands to be put through the Legislature. You are here on the grounds, I am not. You know exactly how to do it—I have no idea of such things. Leave me entirely out of it. All I want is to have the bill passed."

The committee conferred a moment. "The bill would not have the same chance of passing," they said, "if introduced as a Commercial Club bill, as if presented by some individual who is known to be working for the cause of humanity. We will do all we can to push it, and we will stand back of you and do whatever you want done, but you will have to be the leader. Besides, it is only fair that you should have the

honor, when you have done all this work. You will have to come to the Legislature."

What fell? Something seemed to give way in the foundations, and the big Commercial Club building was going round and round! All such things as drowning men see swirled past me. I saw myself, with horror, a married woman with a "career." I saw my family, whom I had never left except for a few days, suffering for my care; the twins going out in the rain without rubbers; my daughters needing me; the cook forgetting to order breakfast-food; my husband, with a southern man's ideas of such things, his indulgence already strained. I saw my friends, disgusted at such publicity. I saw enemies, frowns, —brickbats!

The walls were still going around. I looked up and saw all those expectant eyes upon me, and took a deep breath.

"Oh, I couldn't," I said. "I never dreamed of coming myself. Why, I never even saw a legislature, and I haven't an idea of what to do. Besides, it isn't a woman's work, and you are here right on the ground. And I don't want any honor, if only the bill is passed." "We'll stand back of you, we'll plan everything and make all the arrangements. But it is absolutely necessary that some one must be here who has studied housing laws and housing conditions, and you will have to be present at the committee hearing," they said.

"Let me think a minute," I pleaded.

And now the babies of the tenements went past me, with their little gray pinched faces and outstretched hands. I thought of the absurdity of going thus far and then dropping everything, when these men were ready to take up the work. And the words came to me: "He that putteth his hand to the plow and turneth back—"

I would never turn back!

With the desperate deliberation of a suicide who jumps into the icy water, I took the leap.

"Very well, gentlemen," I said calmly, "if you say it is necessary for me to come, I'll come."

There were some final details of arrangement, and I took my departure. "When the bill has been introduced, and a committee hearing is set, we will send for you," they said.

I went out carrying a heavy burden. For a moment I had laid off my armor and dropped my load. I had hardly realized its weight until I was eased of it, and, as I buckled it on again, it seemed more than I could bear.

A CORRECTION

IN THE SURVEY's article on Illinois women at the polls, issue of April 18, it was stated that "the United Charities issued a different list of candidates endorsed," etc. The reference should have been to the *United Societies*.

INTRODUCE YOUR FRIEND TO THE SURVEY

Haven't you a friend who *ought*, as the saying goes, to be a reader of THE SURVEY, one who would really appreciate the issues if he but knew the magazine *well*?

Why don't you introduce him to us at least, if you do not wish to pay for an extra subscription?

Here is our suggestion in the form of a special offer:

A Renewal and a Trial Subscription of 8 months for a Friend, \$4.00

Mail us \$4.00, and we will not only renew your own subscription but will also send THE SURVEY to any address in the United States for *eight months*.

If you have more than one friend to introduce to us, send us fifty cents for each and we will mail them issues for thirteen weeks.

The GIST of IT—

FEDERAL troops are in charge of the strike situation in Colorado, following the refusal of John D. Rockefeller, Jr., to aid in settling the dispute. The soldiers have ordered both strikers and private mine guards to disarm. The Colorado militia withdraws from the camps as the troopers arrive.

PHYSICAL, moral and economic facts bid fair again to play an important part in determining whether the state may prohibit night work of women in factories. A test case is on its upward way through the courts of New York. Page 169.

MEANWHILE, one day's rest in seven is declared constitutional by the Supreme Court of New York. Page 172.

ANY child in Los Angeles who can scrape together \$7.50 can spend two weeks in a beautiful vacation camp in the mountains, 75 miles away. The city has leased 25 acres of land 5,000 feet above sea level as a municipal playground. Page 174.

OTHER cities might do something as radical if they would study the recreation needs of their children properly. Page 174.

COMMERCIALIZED prostitution in the "Holy Land." Page 169.

WHEN is blindness caused by industrial accidents "total and irrecoverable"? When our law extends compensation to its victims, said the Massachusetts legislators naively. But that, it was shown, would provide for only 6 per cent of accidents, so the law was amended to give compensation for "practical" blindness. Other aspects of saving eyesight brought out by the exhibit of the Massachusetts Commission for the Blind. Page 180.

TO the rural social worker spring brings an awakening social consciousness. Neighborhood, community and taxpayers' associations in hundreds of valleys are the evidence, says Fred Eastman. Page 184.

BUT in the city *spumoni* and *gelati* are not the only heralds of the new season. It is a time for "opening fresh relations with old neighbors," says Robert A. Woods, as well as "the season in which most of the world's revolutions have begun." Page 185.

PROFESSOR COMAN, replying to Dr. Rubinow's criticism of her criticism of the British old-age pension act, recalls the distinction between thrift and parsimony. Page 187.

A MUNICIPAL charities department is too often the football kicked (or kicked at) by every social agency in the city. In two years Otto P. Geier has made the one in Cincinnati the quarter-back of the team. Page 177.

CONCERN for babies in the light of family rehabilitation in Greenwich, Conn. Page 170.

THE Cleveland Chamber of Commerce is considering a copartnership housing plan modeled on English precedents. Page 172.

THE SURVEY

COMMON WELFARE

PROGRESS OF THE NEW YORK WOMEN'S NIGHT WORK CASE

RARELY HAVE the lower courts of New York had the opportunity of passing upon a more far-reaching case than that of the *People vs. Charles Schweinler Press*, argued by Assistant District Attorney DeFord before the Court of Special Sessions April 27. This case involves the right of the state to prohibit the employment of women in factories between 10 p. m. and 6 a. m. Last December a similar case was heard before the Court of Special Sessions, involving the same principles. In order to make a test case the court held the defendants guilty and arrested judgment. This enabled the district attorney to carry the case up on appeal.

The legal record, however, was not satisfactory and a second case was brought. This record includes all the important facts at issue for the information of the higher courts. The district attorney now seeks to have the second case carried as soon as possible to the Appellate Division.

He filed a brief on the legal aspects of the New York case, and also one dealing with the physical, moral and economic facts at issue, prepared by Louis D. Brandeis and Josephine Goldmark, publication secretary of the National Consumers' League. This is the seventh case in which such briefs have been filed at the request of the various state authorities, showing the "world's experience" upon which such legislation is based. The report of the New York State Factory Investigating Commission on the night work of women in the state, in response to which the law was enacted, stated in regard to one hundred women working regularly in the night shift in one mill:

"The married women who worked at night had on an average about 4½ hours of sleep in the daytime; they prepared three meals each day, including breakfast. . . . They also did all the washing for their families. Many of them returned to their homes after 10 hours of work at night . . . to nurse their babies in the morning and during the daytime.

"Ignorant women can scarcely be expected to realize the dangers not only to their own health, but to that of the next generation from such inhuman usage. But it is precisely to prevent such conditions of toil as threaten the welfare of society that labor laws are designed."

The law recommended by the commission was intended not only to stop such practices, but also to check the excessive prolongation of day work by setting a definite closing hour after which all night work is prohibited.

The commission modeled their law upon one which has been in force in Massachusetts for twenty-four years. They also availed themselves of the recorded experience of the fourteen European nations who in 1906 met in Berne, Switzerland, to sign an international treaty prohibiting night work for women in industrial establishments between 10 p. m. and 6 a. m., and requiring eleven uninterrupted hours of rest at night. This treaty, ratified after extended legislative debates by each of the powers represented, except one, went into effect in February, 1912. The principle of protecting women from night work was recognized in the very first statute regulating women's hours of labor enacted in England in 1844.

Robinson in New York Tribune
THE WAR HE LEFT BEHIND HIM

SINS OF THE "HOLY LAND": A VIEW OF TODAY

THE "HOLY LAND" of the twentieth century is a land not of romance and historic devotion but of disquieting realism. Palestine today shows not grazing flocks and nomadic patriarchs but industrial schools, sanitary and social surveys, and a "system of prostitution"!

Writing in a recent number of the *Lancet-Clinic*, Dr. Douglas M'Murtrie of New York records some observations made during a trip by Dr. Blanchard of the Société Française de l'Histoire de Médecine, Paris.

About 5,000 people live in the city of Tiberias, two-thirds of whom are Jews. Of the numerous prostitutes, Jewish women live in the city; Moslem women, in caves or grottos cut in the mountains to the south. Originally used by anchorites and sometimes mistaken for sepulchres, these grottos have long been devoted to their present purpose. There are five grottos near this city, and others in the nearby village of El-Mejdel, the ancient Magdala, and on the road between Nazareth and Nablus. Access is through a low opening, and a decline of about ten yards along which one must actually crawl. The cave is apparently one large room furnished with mats or mattresses, but quite without provision of wardrobes or washing apparatus. In each are from five to ten girls in care of an aged matron.

The girls, from eighteen to twenty-five years of age, are attractive, go veiled about the city, and upon invitation accompany their visitors to the mountain sides. They come generally from Beirut and its vicinity, recruited by promises of fine houses and exalted positions. Most are Moslems, but there are some Christians and Jews.

The clients of these grottos are numerous, married or single, of all religions, and often very young,—youths of fifteen or sixteen being among the frequenters.

Dr. M'Murtrie reports that there is absolutely no legislation in the country on the subject of prostitution; hence venereal disease is widespread and medical inspection a farce. Diseased

PORTABLE SCHOOL HOUSES FOR 1,000 CHILDREN

Photos by H. B. Humphrey, Chicago.

ORDINARILY the "portables" are used as temporary overflows for crowded buildings, but a sudden emergency in one Chicago neighborhood led to the assembling on a vacant lot owned by the School Board of twenty-one of them. Under the direction of the principal, J. J. Zmohal, the boys have been organized as amateur landscape gardeners. With such implements as they have been able to pick up or devise (note the soap-box wheelbarrow) they are grading, spreading a layer of topsoil and planting fruit and vegetable gardens. Their school, the Herzl, will be replaced later by a permanent building. In the meantime, its 1,000 desks are all occupied and there is a waiting list.

women continue their trade in spite of the city physicians' injunction; if ordered to go away, their obedience (more picturesque than effective) is to bathe in the Jordan—and return. If finally arrested, they but spread infection to the soldiers charged with their custody. Medical control is made difficult also by the people's objection to treatment. Symptoms of serious disease are often explained away as "cold taken while out on the mountains."

It is curious that there should be such a lack of legal control in view of the bitter hostility of families toward their daughters who have been thus led away. The Moslems of the region consider it the greatest disgrace to have a prostitute in their families; they will kill such a girl, often with great refinements of cruelty, in order to clear the family name of the stain. Of this attitude Dr. M'Murtrie gives this instance:

"Recently a young Moslem girl went as a prostitute to Beirut. Her two brothers got track of her, went to see her, and, without any suspicion of their intention, she accepted an invitation to go for a walk in the country. Upon reaching a field previously determined on they tied her to a tree, and dug in the ground a hole deep enough to receive her with the exception of her head. They put her into it, cut off her head with the stroke of a sabre, and covered her body with earth. Now, said they, we can again assume our standing. The deed was known, but remained unpunished, and all the people approved."

"FAMILY ENTRANCE" CLOSED IN CHICAGO SALOONS

LARGELY AS the result of publicity given to a survey of conditions demoralizing to women and girls in the saloons of Chicago, made under the supervision of the Chicago South Side Club last summer, the City Council has passed an ordinance forbidding the use of the signs "Family Entrance," "Ladies' Entrance," "Private Entrance," "or any other inscription designed to indicate that such entrance is intended for the admission of women." The survey was made by a woman investigator, and tended to show that the back rooms with special entrances for women contributed largely to the delinquency of young women and girls.

The investigation involved 478 saloons located on the principal thoroughfare of each of the three sides of the city. More than half of these saloons were located on corners and therefore found conditions in corner saloons more often bad than in other saloons.

An estimate, claimed to be conservative, of the extent to which the back rooms are patronized by women drinkers, placed the total number of women and girls in the 343 back rooms found in these 478 saloons at 14,602 for each 24 hours. With respect to these back rooms, or wine rooms, as they are called, the report says:

"Immediately upon the adoption of the wine room ordinance in Chicago several years ago, there began the extension of the back rooms for women and girls,

and the installing of various devices to evade the provisions of the ordinance through booths, stalls, and screens. Many of these substitute rooms are partially obscured from the general room, and a large proportion of them are practically secluded. . . . During the last three years the devices for securing privacy have been installed by wholesale and no one has lifted a finger to prevent the pernicious innovation."

An ordinance directed at the abolition of booths, stalls, and screens was also before the council, but failed of passage and has been recommitment to the judiciary committee.

THE CASE OF THE TWINS OF GREENWICH

THE PREDICAMENT of a pair of homeless twins in Greenwich, Conn., stirred up a controversy which has lasted three years and become the predicament of the town in that it raised the question of permanent provision for needy babies.

Sympathetic townspeople and members of the United Workers, the Greenwich relief organization, suggested that the Emily Bruce House, owned by the town, be used for a babies' home. Accordingly, an arrangement was made whereby the town was to loan the Emily Bruce House to the United Workers "for charitable purposes" for five years or longer, providing that if their use of the home was terminated by the town board under seven years, the town was to pay the United Workers \$1,000 for the improvements made on it.

A committee was appointed to equip and run the house as a charitable institution for babies. An outlay of several thousand dollars was made and preparations were being concluded for the admission of the children when a specialist in child-caring work chanced to visit Greenwich. She expressed the opinion that boarding-out in private family homes was better than institutional care for babies.

Instantly the town was split into two factions. One urged a suspension of work on the institution until local needs had been further considered and expert advice secured. The other determined to go ahead with the original plans. After many pros and cons the institution committee won out on its contention that the home was needed.

In January, 1913, the house was opened with the original twins and seven other children in residence. It very soon became apparent that there were not enough dependent children in Greenwich to warrant the heavy expenditure made by the United Workers to maintain the home. A trained secretary engaged by the United Workers investigated the family resources of every baby in the institution and submitted a report showing that each case could be more economically and better

TIME EXPOSURES by HINE

THE INDUSTRIAL REVOLUTION UP TO DATE

The manufacturers of this cotton-picking machine believe that it will not only save time and money, but will eventually drive out the child pickers whose work was described and pictured in *THE SURVEY* for February 7. Large growers are adopting it and the present plan is to arrange for co-operative ownership of machines among small cotton growers, much as northern farmers own thrashers and reapers in neighborhood groups. The power cotton-picker must be manned by skilled operatives. Its adoption tends directly to drive women and children from the long-drawn drudgery of the fields.

provided for in its own or in a carefully selected foster home; that the institution had actually created some of the child dependency it claimed to relieve.

An expert investigator from an impartial agency in another city, who was invited by both sides to study child dependency in Greenwich, recommended that a paid visitor be engaged to do family rehabilitation work and that the Emily Bruce House be discontinued or used for other social purposes. The United Workers, acting upon this recommendation, engaged a case worker to re-establish families from whom children had been taken and to place out children who had no family resources. They also notified the authorities that no children could be supported at the Emily Bruce House later than March 3.

Then the opposition, in a master stroke, appealed to the selectmen to remove the Emily Bruce House from the auspices of the United Workers, refund to it the \$1,000 as agreed and turn the institution over to a corporation called the Emily Bruce Shelter which would run as a home for babies independent of the United Workers.

To settle the matter, a town meeting was called and heralded far and wide by the newspapers. The United Workers had representatives to argue their case from the platform on a basis of social principle. But practically the entire body of the hall was packed with Italians and Poles, who had been brought up in chartered cars to cast

their votes as to the most approved ways of caring for babies and there was little argument as it was obvious from the start how the vote would fall. Hundreds of grimy hands raised on a signal from a district leader settled the question.

Back to the town went the Emily Bruce House, only to be promptly turned over to those representing the "Emily Bruce Shelter, Incorporated."

But, socially speaking, this was not the chief result of the meeting. The babies' home is still running, to be sure. The twins are there, with a few other little inhabitants. But outside of it and over it is spreading a true concern for children in the recognition of the need for family rehabilitation.

EXCHANGE OF TOWN PLANNERS WITH EUROPE

WHILE A GREAT deal of publicity has been given to the exchange of professors between the great universities of Europe and America, very little has yet been paid to the equally significant exchange of community planners that has taken place during the past year or so. While the professors may succeed in interpreting the ideals of one nation to another, the town planners, and their collaborators, the housing workers, will modify standards and methods of living in a way likely to have an even greater and more lasting effect.

Already in Germany the old ideals which found expression in wide avenues

and "model" tenements have been greatly changed by acquaintance with the narrower streets and cottages of England, while English town planners admit their debt to the Germans for lessons in systematic city building.

Though America, like England, is and always has been in the main a land of single-family houses, its first attempts at town planning ignored this tradition and followed continental models, seeking spectacular effects without thought of the inevitable consequences to the dwellings of the people.

But the saving grace of town planning is that it cannot confine itself to one phase of community life, it cannot provide only for magnificent civic centers and impressive boulevards, but must take into account the less obtrusive but in the aggregate far more important factors which affect the daily life of the people. So before many American city plans had gotten beyond the books and reports in which they were outlined, community planners realized that they were considering only a fraction of their problem.

In coming to this realization, America was assisted greatly by the exchange of opinion in the Old World. It showed that while the Bourbons and Hausmann and Frederick the Great and L'Enfant had done much to create great world capitals, they had left much undone, or had even rendered more difficult the still greater task of making cities good places for the vast majority of people to live in; that, after all, it is more important

Cesare in New York Sun

NOT IDLE

that a city provide wholesome, safe and pleasant dwellings for its people than that it become one of the show places of the earth and a Mecca for tourists.

So community planning has become an international vocation. Students of one nation have for years been visiting others in search of new ideas. Now we have reached a stage when one nation calls in advisers from another before beginning a serious undertaking. The value of a fresh point of view, of a different or more varied experience, is realized.

America has recently entertained Werner Hegeman, Henry Vivian and E. G. Culpin. Australia chose Walter Burley Griffin, of Chicago, to plan its proposed federal capital, Canberra. Dublin has called in John Nolan, of Cambridge, before deciding upon the plans for a rehabilitated Irish capital. Greece has invited Thomas Mawson, lecturer in landscape design at the University School of Town Planning in Liverpool, fresh from his work in western Canada, to submit plans for the future development of Athens. And Prof. Patrick Geddes, of England, has been drafted from his proposed lecture trip in America to make a town-planning tour of India—apostle of the newest of civic movements to some of the most ancient cities of the world.

The building of a modern city is a many-sided task into which recent inventions and discoveries in medicine and the better social standards of today have introduced big problems.

SIX-DAY LABOR LAW UPHELD IN NEW YORK

THE SUPREME COURT of New York has declared constitutional the clause in the state labor law which provides for one day's rest in seven. The decision was the result of a writ obtained by Charles Deutermann, an ice manufacturer, who forced a test case.

In ordering the writ dismissed, Justice Tompkins pointed out that since the penal code makes all unnecessary Sunday work illegal in trades, manufactures and mechanical employments, the statute under consideration was apparently framed to provide employes in factory or mercantile establishments that are in operation on Sunday, with some other full day of rest in every seven. He said:

"I think the law may be sustained as a health regulation and for the general welfare of the public. It has always been held that the state has power to protect the health and morals of the people and preserve the repose and sanctity of the Sabbath day by forbidding labor and industrial and commercial pursuits on that day. I think the state has the same power to require employers who have the legal right to conduct their operations on the first day of the week to provide their employes another day out of every consecutive seven days for rest and recreation."

The law was adopted in May, 1913. It was sponsored by the American

Association for Labor Legislation and follows the standard bill framed for uniform state legislation. A similar law was enacted last year in Massachusetts.

While there are one-day-rest laws on the statute books of five other states—California, Connecticut, Missouri, Pennsylvania and Wisconsin—they are so loosely drawn as to be practically dead letters.

CO-PARTNERSHIP HOUSING PLAN IN CLEVELAND

SOME TIME AGO the city, in order to acquire a strip of land needed to link together two parts of its park system, bought a ninety-three acre tract. The surplus, it was proposed, should be used for a municipal housing scheme. The proposal took many forms, but these were finally boiled down to one which is outlined in a report recently made by the housing committee to the directors of the Chamber of Commerce.

The committee recommends that a company be formed to build dwellings on this land, title to which shall be retained by the city and the use only leased, with proper restrictions, to the company. The company is to issue two kinds of stock, one with interest limited to the current rate, the other without limit on possible interest.

The second kind of stock would be sold in small denominations to tenants only, each of whom on taking his house would be required to subscribe to an amount equal to two years' rental. At this time an initial payment of \$50 or so would be required, the balance to be paid in small installments. The interest on this stock would be paid out of the profits of the company after payment of all fixed charges, including interest on the first kind of stock and rent to the city for the use of the land. This interest would in effect reduce rentals while the ownership of the stock would give householders "a stake in the community."

The scheme is modelled upon that used for a decade or more by the English co-partnership tenant societies.

The committee submits an estimate of income and expenses. The land is valued at a little over \$1,300 an acre. The price per front foot for improvements is put at \$8.50. On a basis of fifteen dwellings to the acre, the proposed maximum, the improvement expense is estimated at \$60 per house. These houses are to be of hollow tile or cement construction and are to contain bathroom, cellar and hot-air furnace. The estimated cost per house, if building operations are undertaken on a large scale, is \$1,600. Such a house, the committee believes, could be profitably rented at \$20 a month and yet earn \$27.46 a year to be distributed *pro rata* among the tenant share-holders.

The committee states that arguments for better housing in general are no

longer needed in Cleveland as leaders in civic and commercial life are convinced of the perils of bad housing and the advantages of good housing. Its proposals are submitted in the belief that they will stimulate good housing. It clearly realizes their limitations, however, and admits that the proposed dwellings will not come within the means of the unskilled wage-earner, whose need is the greatest.

SOME GAINS FOR MERCANTILE WORKERS IN WASHINGTON

ON APRIL 21, the Industrial Welfare Commission of Washington, accepting the recommendation of a conference of representatives of mercantile store owners and employes and of the general public, ruled that no adult woman employed as a clerk in a mercantile establishment in that state should receive a wage of less than \$10 a week.

Furthermore, the commission ordered that the apprenticeship or learners' period should be limited to one year, the wage for the first six months of this time to be not less than \$6 a week, and for the second six months, not less than \$7.50. Not more than 17 per cent of the total number of women employed in any one establishment may be apprentices, and one-half of those who come under this classification must be serving the second six months of their apprenticeship, that is, one-half the apprentices must be earning \$7.50 a week. According to a provision in the law, individual permits must be issued by the commission to all women applying for work who are to receive less than the experienced adult's minimum wage.

Minors, in Washington, are all persons under eighteen years of age. The commission ruled that they must be paid \$6 a week, and may not be employed after 7.30 p. m.

The wage recommendation of \$10 a

week for experienced adults came unanimously from the conference as a compromise between \$8.25, the wage proposed at first by the employers, and \$12, the wage proposed by the employes.

The Industrial Welfare Commission, which took up its duties in July, 1913, did not call the mercantile conference until it had made extensive investigation into wages, working and cost of living conditions of women employes in the mercantile, manufacturing and laundry trades in the state. Last fall, the commissioners held separate, informal hearings with employers and employes in these three industries in the largest cities of the state to learn something of what both groups expected from the law. Meanwhile, a statistical survey, through questionnaires sent to employers and employes, had been started.

With the assistance of Caroline J. Gleason, secretary of the Oregon Industrial Welfare Commission, the Washington commission issued a report early in March on the three industries mentioned, and assembled its first conference on March 31. The report showed that of 11,059 workers in the state, a few are earning less than \$4 a week. The wage most generally received approximates \$8.

The basis of comparison was \$10 as the investigation revealed that this sum is the minimum on which a self-supporting woman can maintain herself in frugal comfort. Sixty-seven per cent of the 11,059 women were receiving under \$10 a week. Of the 5,300 employes in mercantile establishments, 55 per cent were earning less than \$10 a week. Of 1,750 factory workers 71 per cent, and of 2,300 laundry employes, 70 per cent earned less than \$10 a week.

The commission has fixed May 14 for the factory conference and May 16 for the laundry conference.

CLEVELAND'S NEW WELFARE COUNCIL

A TEAM of practically all the welfare organizations of Cleveland, both public and private, has been worked out under the name of the Cleveland Welfare Council. Its stated purpose is to provide clearing-house facilities through discussion, committees, files of social data and the like, for the interchange of information, ideas and plans relative to community welfare with a view to preventing duplicated or unrelated efforts on the part of social agencies or individuals and to recommending to proper agencies or individuals needed welfare activities.

Regular membership in the council is of organizations or institutions. The initial members include the following: Chamber of Commerce, Federation for Charity and Philanthropy, Cleveland Foundation, Federated Churches, Federation of Women's Clubs, Catholic Diocese, Academy of Medicine, Western Reserve University, Case School of Applied Science, Federation of Labor, Child Welfare Council, Federation of Jewish Charities, City Club, Civic League and Chamber of Industry.

Ex officio members are the following named officers or their representatives: judge of Juvenile Court, presiding judge of the Common Pleas Court, judge of Probate Court, chief justice of Municipal Court, the mayor, the director of public welfare, the commissioner of research and publicity, the director of schools, the superintendent of schools, the president of the Board of Education, the public librarian and the state factory inspector.

The executive committee has power to elect, in addition, ten representatives at large to serve for a period of one year.

Belle Sherwin, prominent in philanthropic work, has been elected president of the council.

MY SISTER'S HERITAGE

MARY S. EDGAR

BUDDING tree and singing bird,
Joy of springtime seen and heard;
All the wealth of all the year,
Scattered by the wayside here.

But oh, little sister of mine in the shadowy places,
Where the wheel turns, and the small young fingers ply,
I cannot forget that this is yours, too, to inherit—
The open fields and the streams and the clear blue sky.

Stirring sap and quickening sod—
Miracles revealing God:
Prophets of His fatherhood,
Speaking from the field and wood.

But oh, little sister of mine in the shadowy places,
Where shoulders droop, eyes dim, and cheeks grow wan,
I yearn for your hand, and a road that leads to the open,
To the common-wealth of the fields, ere the light be gone.

CIVICS

MUNICIPAL VACATION CAMP FOR LOS ANGELES IN SAN BERNARDINO MOUNTAINS

A VACATION camp in the mountains, 75 miles from Los Angeles, is now a part of that city's municipal playground system. For the past three summers the playground department has conducted a camp accommodating boys and men in July and girls and women in August. This proved so successful that the playground commission determined to secure a permanent site. A beautiful location was found in the federal government forest reserve in the San Bernardino mountains. With the approval of the secretary of agriculture, 23 acres of land have been leased by the federal government to the city of Los Angeles for a nominal sum—\$10 a year.

The camp site is at an elevation of 5,000 feet, and is partially covered by a heavy growth of pines. The surrounding mountains provide magnificent scenery and opportunity for many delightful short trips. An excellent automobile road makes transportation from Los Angeles easy. Auto trucks equipped with seats and awnings will be used to convey the campers and it is estimated that the round trip rate will not be more than fifty cents each. By regular modes of travel, the transportation would be many times as much.

Based on experience in the camp as conducted during the past three summers, the playground commission expects to furnish transportation and board for two weeks at a cost of \$7.50. This amount will actually cover all expense except the cost of original improvements and plant and the salaries of those in charge. These items will be met by the city.

Before summer a rustic building to be used as kitchen and store room will be erected. Later a screened dining-room will be added. Tents with wooden floors will be provided—large enough to accommodate four campers each. A swimming pool will be part of the first year's equipment. It is expected that each year improvements will be added and that larger numbers of people can be accommodated.

At the head of the work the commission will place its best playground director, a man of broad experience in camp life. He will be in charge throughout the entire season. Under his supervision, when the boys are in camp, there will be two assistant directors and several competent volunteer directors, making in all approximately seven capable supervisors for the camp. During August a similar number of assistant directors and supervisors for the girls and women will be at the camp. It is hoped that later it will be possible to

BUBBLING STREAMS AND FOREST TREES ON THE CAMP SITE

make arrangements for family groups.

During the remainder of the year the camp will be open for parties who wish to make use of it for week-end trips, holidays and vacations. In winter the snow is often several feet deep, and this is an attraction for those who live in the lower and milder regions where snow is never known.

Among the 500,000 people in Los Angeles, only the few who can afford hotel prices have hitherto had an opportunity to enjoy the glorious mountains so close at hand. The playground department hopes through this camp to make it easy and inexpensive for large numbers of the city's people to spend vacations in this invigorating and inspiring region.

PLAY AND PHYSICAL DEVELOPMENT—By Henry S. Curtis

THE PLAY MOVEMENT has spread rapidly over the United States, and yet it has never taken hold of popular imagination as have a number of other recent social movements. I believe the reason for this is the lack of definite facts in regard to the effect of present city conditions upon children.

We know that city children often grow up weakly, and that they seldom have the sturdy strength and health of country boys of forty or fifty years ago. We know that the repression of vigorous physical activity that comes from restricted play spaces must necessarily mean a lowered physical development. But we have no picture of the extent of this repression, because we have no standards. If it could be shown that the children of a certain city had only two-thirds of the normal physical strength of children of their respective ages, and this could undoubtedly be shown in many cities, it would not require much campaigning after that to secure the play facilities that the city actually needed.

It is generally conceded, I suppose, that the health of school children is pretty closely dependent on their leading a vigorous life in the open air. The year following the introduction of open-

TWENTY-THREE ACRES OF SUCH BEAUTIFUL COUNTRY A PLAYGROUND FOR LOS ANGELES CHILDREN

air play into the curriculum of the schools of Prosheim, Germany, the number of days absence on account of sickness fell off nearly one-half. The departments of school hygiene should be required to determine the average morbidity of school children for each city, as this is the measure of the need of and the success of the department.

It is conceded that the development of grace and motor skill in children comes mostly from their play. The relative awkwardness of the German boy who in the old days was trained mostly in gymnastics was apparent when he was compared with the English boy who was trained in athletics.

It ought to be possible to get some measure of the physical development of children and here we have three fairly good tests, anthropometric and dynamometric measurements, the test of the Public School Athletic League, as worked out in New York city, and a pedometer record of activity. The standard of the Public School Athletic League says that every boy under thirteen who can jump 5 feet 9 inches standing, chin a bar four times, and run the 60 yard dash in 8 3/5 seconds, shall have the standard button of the league.

It will be noticed that this is a test of three fundamental sets of muscles of the arms, the trunk and the legs. At the time I took charge of the playgrounds of the District of Columbia, we tried the test in the various playgrounds about the city, but could not find a boy who could do the three things. After four summers of organized play we tried the test again. There were 500 boys who did the three things. There were more than 2,000 boys who could do one or two of the three things.

The same progressive development has doubtless taken place in many cities. The percentage of young men who pass a creditable physical examination on entrance to the German army varies from 28 per cent in Berlin to 65 per cent in Mulheim. It is in almost direct proportion to the play facilities furnished. Probably the most valuable test that could be secured, however, would be a test of the physical activity of children as recorded by a pedometer. I am confident that in closely built cities that make no provision for play, the physical

TWO FAMILY HOUSES ERECTED FOR THE NEW HAVEN IMPROVEMENT ASS'N
These houses, put up by the Standard Buildings, Inc., show great advance in architectural treatment over most wage-earners' houses.

activity of the children is two or three miles a day less than it is in cities that make ample provision.

I believe that this average daily activity is considerably lower in the South than in the North. I believe, also, that where the whole nervous system is set to the development of a certain amount of energy, such as this activity largely represents, through the years of childhood, this determines the energy of the individual for the rest of his life. If this is true, then the need of the provision for play is much greater in the South and all warm countries than it is in the North. "The boy without a playground is father to the man without a job."

In my study of the activity of the school children of Worcester, Mass., by pedometer records, I found a daily activity of nearly nine miles. It would be interesting to secure such records from a series of cities and average and compare them so as to get a standard. I am confident that these records would show how faithfully the lack of play facilities is recorded in a lessened activity, poor physical development and low vitality.

Such an investigation would cost considerable, but it would give a direct physical measure of how great a handicap restricted play spaces, dirty and dangerous streets, and a warm climate are to children.

HOLLOW-TILE WORKMEN'S BUNGALOWS AT HAUTO, PA.

These cottages, containing four rooms, were built by the Standard Buildings, Inc., for the Lehigh Coal and Navigation Co.

REDUCING THE COST OF SMALL HOUSES

NOW THAT the disadvantage of tenement or barrack dwellings are being recognized effort is being made by manufacturers, who have found that it pays to provide good homes for their employes, and even more by those who are seeking to improve social conditions in our cities, to find some method of reducing the cost of building small houses. This problem is engaging the attention of architects and builders throughout the country who believe that it can be solved on a sound financial basis. Among them is the Standard Buildings, Inc., which has recently designed and erected one and two story cottages for the Lehigh Coal & Navigation Co. at Hauto, near Lansford, Pa., and a row of two family houses at New Haven, Conn.

The walls in these houses are of hollow tile, of which a new size was made—6 by 12 inches face by 6 inches thick with double air spaces—so there would be no need of stucco or other outside covering. The price of such houses would, of course, vary somewhat with location, availability of material and labor costs.

Three types of houses have been erected:

(1) Bungalows containing a large living-room, two double bedrooms of over 800 cubic feet of air capacity each, and a kitchen. There is a center chimney, a water closet, a soapstone wash-tub and sink. The cooking range will heat the house from the living-room in winter and in summer can be moved into the kitchen. There is a large front porch and a smaller one in the rear. The hollow tile in these bungalows is smooth on the interior and is whitewashed, doing away with the use of plaster and presenting a most durable surface practically proof against wear and tear.

(2) Five-room two-story houses. The rooms in the second story are full height. There is a living-room, dining-room, kitchen, two bedrooms and a bath. Also a cemented cellar and excellent hot-air furnace.

(3) Six-room houses, similar to those with four rooms but with a larger living-room and three bedrooms.

Good closets are provided in all these houses. The five- and six-room houses are plastered in the usual way with a white finishing coat. The cheapest of the houses costs \$750. It contains three rooms and water-closet. In the kitchen is a sink with running water. From this the price mounts to a six-room house, containing bath as well as water closet, which costs \$2,575. The cheapest house with bath costs \$1,500 and contains five rooms.

The builders present a table of figures to show that these houses could rent for from \$6 a month for the cheapest to \$19 a month for the most expensive and yet yield a profit of from 2 to 13 per cent,—the more expensive houses being the least profitable. The cost of the land, however, does not seem to be included in figuring these profits.

RECREATION IN CHARLESTOWN

Charleston, first city in South Carolina to have a municipal playground, has this year appropriated \$2,500 for the operation of two playgrounds. A trained supervisor is giving his entire time the year round, and a director for girls' activities is on duty afternoons.

As early as 1900 the women of the Civic Club opened a playground in Charleston but lack of funds forced them to give it up after two years. In 1910 the city opened a municipal playground and turned its operation over to a commission of nine, of whom five are women, members of the Civic Club. The appropriation was \$700 in 1911; it was increased to \$1,000 in 1912, \$1,500 in 1913, and \$2,500 in 1914.

THE MOVIES IN PHILADELPHIA

A study of motion picture shows in Philadelphia was made during the past winter by a special committee of the local Social Workers' Club. It was sought to discover "who attend and why," and "what they find." The study indicated that the shows are not so exclusively children's theaters as some of the committee had supposed; that while some pictures are cheap, vulgar and excessively melodramatic, the standard on the whole is high; and that great danger lay in the lack of proper ventilation, in eye strain due to frequent attendance where worn-out machines and films are used, and in inadequate policing and lighting.

A questionnaire was sent to several grammar and high schools to find out what, aside from the cheapness, was the charm of the "movie," what type of pictures was most popular and whether interest varied with sex and age and race. Out of 2,531 grammar scholars 2,170 had attended 9,813 times the preceding month—boys averaging 5 times and girls 3 1/3 times. Colored and Italian children, perhaps because of poverty, attended least often.

Attendance of children, measured by grades, indicated that as children grow older they tire somewhat of the pictures. Comic pictures were preferred by over half the fifth-grade pupils, while educational films gained in popularity up through the eighth-grade pupils. Older boys inclined away from

the "movies" and toward vaudeville and girls toward the drama "because it is real" and "you can hear what they say." Among 142 first year high school girls 18 preferred the "movies," 10 vaudeville and 103 plays. Among high-school seniors 54 per cent of the boys and 76 per cent of the girls preferred the play to the "movies."

THREE CITY PLANS

Erie, Pa., Newark, N. J., and Alton, Ill., have recently published city plans.

"Greater Erie" is a volume of 254 pages, profusely illustrated with local views and maps, pictures showing suggestive arrangements in other cities, and illustrations of proposed changes in Erie. The plan was prepared by John Nolen, city planner, Cambridge, Mass., who associated with him E. P. Goodrich of New York as consulting engineer, Henry C. Long, of Boston, as expert on commercial developments and F. Van Z. Lane as traffic expert. The work was done and the report published under the auspices of the City Planning Committee of the Chamber of Commerce and Board of Trade, organized in 1911. These two organizations have recently voted to amalgamate.

The city plan report has five heads—streets, railroads, water front, buildings and open spaces. One of the most interesting features is the proposed treatment of the Lake Erie shore.

The Newark city plan was made under the direction of a municipal commission, David Grotta, president. The expert advisers were E. P. Goodrich and George B. Ford of New York. Suggestions are made for improvements in the street system, accompanied by definite notes as to what would be accomplished and how much the cost would be. The way in which these improvements could be completed within ten years under existing laws is shown.

Charles Mulford Robinson of Rochester, N. Y., was the city planner engaged by the Alton Board of Trade in preparing a plan for that city. The report is based upon a brief examination of the city's main problems, rather than upon precise surveys of a topographic, sociologic and economic sort. City maps and an enlargement of the city engineering department to deal with unusually difficult engineering problems are proposed.

HOUSING AND TOWN PLANNING

The two related subjects of housing and town planning form the title of the January number of the *Annals of the American Academy of Political and Social Science*. In their modern form, they are comparatively new to all except a few specialists. The topics of the thirty-six articles here brought together are in themselves interesting as showing how the two subjects dovetail into each other and how widespread are their ramifications.

For a reader who already knows enough of the subjects to judge and to correlate as he reads, this January volume of the *Annals* is of great value. It presents many facts outside the scope of common knowledge, it challenges ac-

cepted beliefs, it stimulates the imagination to follow unfamiliar paths. But it is not a text-book to be accepted without question. Rather it is a sort of examination paper which shows how much we have learned and indicates how much we still have to learn. Many of the differences of opinion which it expresses will have no place in future papers, for we shall find that they are due to partial understanding.

PRIZE FOR CIVIC ESSAY

Through the generosity of Morton Denison Hull of Chicago, the National Municipal League has established an annual prize of \$250 to be awarded for the best essay on a subject connected with municipal government. The competition is open to post-graduate students who are, or who have been within a year preceding the date of competition, registered in any college or university of the United States offering distinct and independent instruction in municipal government.

For 1914 the prize will be awarded for the best essay for any one of a number of topics which have been announced by the League. The list may be obtained by addressing the National Municipal League, 703 North American Building, Philadelphia, Pa.

Sources of Information on Recreation is the title of a pamphlet just issued by the Department of Recreation of the Russell Sage Foundation. While not exhaustive, the list includes the best of the up-to-date books, pamphlets and magazine articles. Arrangement is made by subjects: General Equipment and Administration, Social Centers, Boys' and Girls' Clubs, Recreation in Rural Communities, Games and Dramatics, Athletics, Sports and Outings, Folk Dancing, Story Telling, Holidays, Festivals and Pageants, School Gardens, Public Baths, Home Recreation, Study Courses for Play Leaders, and Surveys.

A report on public and semi-public comfort stations in New York City, based upon a study from social, sanitary and economic points of view, has been published by the Department of Social Welfare of the New York Association for Improving the Condition of the Poor. There are many recommendations covering construction, sanitary equipment and greater serviceability.

Public stations are reported to be strikingly superior to many under private control, notably those in connection with the subways and elevated railroads.

A summer school of town planning will be held August 1-15 in London. The committee in charge is under the chairmanship of Raymond Unwin and the course will be given in the buildings of the University of London. In addition to the lectures there will be excursions and visits to places which illustrate the principles of town planning. An exhibition of maps and plans is to be formed to facilitate the study. Information may be obtained by addressing J. S. Rathbone, Fitzalan House, Church End, Finchley, London, N.

SOCIAL AGENCIES

DR. GEIER'S WORK IN THE CINCINNATI DEPARTMENT OF CHARITIES—BY W. J. NORTON

DIRECTOR, COUNCIL OF SOCIAL AGENCIES

FULL of challenges is the second annual report of Dr. Otto P. Geier, retiring superintendent of the Department of Charities and Correction of Cincinnati. But there is also an interesting record of Dr. Geier's answers to his own challenges.

"In strong contrast," says Dr. Grier in his report, "to the transformation that has been wrought in those city departments which serve all of the people is the comparative lack of advancement in the welfare departments whose functions are to care for the unfortunate, the sick and the delinquent.

"It was brought home to the management of these institutions," pursues the

report, "that the 18,000 dependent, diseased, and delinquent people that they were housing were but the results of certain social ills of the community, and that the treatment of these particular individuals, laudable as it was, was merely palliative,—a curative process for a few, rather than a preventive one for the mass. With this broader vision came the readiness to join with private charities in coping with the whole problem, and the desire to know whether each institution was measuring up to modern requirements."

Acting on the spirit of co-operation the Charities Department became the dominant leader of all the social forces of the

city. Expenditures for outdoor relief were delegated to the Associated Charities. The Anti-Tuberculosis League was made the clearing house for tuberculosis patients. Applicants to the City Tuberculosis Hospital were admitted only by way of the league's clinic; and discharged patients were returned to the direction and supervision of the clinic physician and nurses. Influx of non-residents to the General Hospital was stopped and the flow of hospital population quickened through co-operative work with the Hospital Social Service Commission.

Chattel mortgage loan sharks, except two, were driven from Cincinnati by a joint campaign between the department and the Citizens Mortgage and Loan Company. Fake solicitors of charity funds were checked by co-operation

THE LINES, WHICH WERE COLORED IN THE ORIGINAL, TRACE BACK TO THEIR HOMES THE TUBERCULOSIS AND VENEREAL PATIENTS IN CITY HOS-

PITALS AND THE INMATES OF THE INFIRMARY AND THE WORKHOUSE OF CINCINNATI. ALMOST TWO-THIRDS OF THEM CAME FROM THE TENEMENT DISTRICTS, WHERE ONE-THIRD OF THE TOTAL POPULATION OF THE CITY LIVES IN ONE-NINETEENTH OF ITS AREA. FROM A MAP PREPARED BY DR. GEIER'S DEPARTMENT.

with the Council of Social Agencies. Two colored solicitors who had collected \$9,000 were prosecuted by the department and imprisoned. Shantytown, the open sore of Cincinnati's housing problem, was burned.

Pursuing "the desire to know whether each institution was measuring up to modern requirements," the department, through its Bureau of Social Investigation and Relief, made a number of interesting studies. An investigation of the infirmary revealed that 10 per cent of the inmates were persons not properly a charge upon the community. A similar study was made at the hospital and the adoption of the National Conference Transportation Rules followed. Strict enforcement of these rules stopped "passing on" to Cincinnati, and insured sensible, humane treatment of itinerant dependents. People who formerly placed their aged parents in the city almshouse now support them. Approximately \$1,500 each year is collected from persons able to pay for their parents' support but unable to give them personal care.

The Bureau of Municipal Research, at the request of the Charities Department, made an investigation of the old House of Refuge and suggested a complete reorganization of methods, pending the completion of a cottage plan home for delinquent boys and girls now building. A system of mothers' pensions has been put into force by the department so that children may be kept at home instead of being committed to the House of Refuge.

Another activity of the department was a survey of Cincinnati's institutional population to trace some of the contributing causes of their being public charges, which showed that 70 per cent of the inmates of the city's institutions came from the tenement districts. One-third of Cincinnati's population lives in 1/19 of the city's area. Certain localities in the densely populated sections, the survey showed, were contributing heavily to crime, disease and dependency.

On September 1, 1913, there were in city institutions the following inmates coming from one block in which the "Silver Moon," a notorious tenement, is located: two cases of tuberculosis, six cases of venereal disease, two prisoners in the work house, two infirmary inmates and one contagious disease hospital case. This block, through social neglect, was costing the city about \$25 per day.

The report covers two full years of Dr. Geier's superintendency. Not the least service he has rendered to Cincinnati is a widespread awakening of the community to an interest in its social problems, through a well-conducted publicity campaign. In fact, to this aroused interest may be directly traced the determination of the new administration to retain this new department in its entirety, with its efficient methods and non-partisan staff. It also probably brought about the appointment of an able social worker as successor to the retiring superintendent, who will carry on the work so effectively started by Dr. Geier.

CLASSIFYING THE MARYLAND STATE SUBSIDIES

THE SEVENTH BIENNIAL REPORT of the Maryland Board of Charities and Correction, recently published, is remarkable in that it is an account of the charities of a state which still clings to the subsidy system. Maryland's policy in regard to its charitable obligations has been one of giving lump appropriations to all kinds of institutions. The list of state-aided institutions, includes almost everything from a state hospital for the insane with 1,500 patients, to a small day nursery with an average attendance of only eight or nine children.

This is the first report of this board gotten out by a trained social worker, and it endeavors to deal with principles and show the lack of system under which one or two million dollars a year have been dealt out by the state treasury. After describing a system of

perform a service for all the people, it has no right to perform it for any. 3. The state owes to the people for whom the service is directly performed a duty to see that they get the best treatment it can give to them. 4. The state is under obligations to the taxpayer to see that these services are secured for the least amount of money whether the instrumentality used be public or private.

In order to put the above enumerated principles into operation, and to correct certain other abuses, the report recommends the enactment of a law providing for its own reorganization by placing the board on a non-partisan basis, and providing that two of its members be women. This law would also give it supervision over all charitable institutions in the state, create a licensing system similar to that of Ohio for all child-caring institutions, and put the payment of the state appropriations on a contract basis.

PRACTICAL SOCIOLOGY IN KENTUCKY—By Alexander Johnson

THE DEPARTMENT of history and sociology of the University of Kentucky has just published a preliminary report on the county infirmaries (almshouses) of the state. It is founded on information collected from county judges and attorneys, students and interested members of the community. The report discusses location, farms, buildings, superintendents, inmates, religious consolation and needs, and makes some recommendations.

Two statistical tables are given. One shows property value and cost of maintenance of the infirmaries in 98 of the counties of the state. The other gives number and class of inmates by sex, age, race and mental and physical condition. The number of inmates in each institution varies from 1 to 74, the average being about 12. The cost per week per capita ranges from \$6 in an infirmary with 24 inmates, to 75 cents in one where there are 74. The latter is on a farm of 120 acres worth \$100 an acre under a superintendent with a salary of \$1,200 a year.

Striking discrepancies are shown. For instance, one county has buildings costing \$25,000 on a farm of 80 acres with 29 inmates, 15 of whom are classed as workers. Another has buildings worth \$500 on a farm of 150 acres with 17 inmates, all of whom are reported as workers, although 4 are said to be paralytics. On a few of the farms the building consists of an old log cabin, others have modern buildings.

The report is not presented as complete, but it is an interesting and valuable document. There is no state official board which is concerned with the statistics or the management of the almshouses, and the department of sociology has a clear field. The report shows the opinion of the department as to the kind of "sociology" that is worth studying. As class material for students, it is of value for several different reasons.

It is a far cry from the old-fashioned institution of higher education that

reports and records, which did not exist prior to the present board, the report endeavors to set forth principles on which state aid should be given.

It divides all state charities into two parts: 1. Those dealing with such subjects as are everywhere recognized to be solely subjects of state care, such as the insane and the delinquents, with none of which do private charities attempt to deal; 2. Those which are conducted under private auspices but which in Maryland, in the past, have been practically supported by the state, such as general hospitals, child-caring institutions and homes for the aged.

The board feels that it is the state's first duty to provide for the first of these classes, and then give whatever it can afford to the second.

Whenever aid is given to the second class, it should be under the following conditions: 1. No appropriation should be granted for any purpose unless either the community is protected from danger or harm, or the work is necessary to guarantee the future of the state. 2. Until the state is in a position to

chiefly concerns itself and its students with the classics, to the modern university alive to the needs of its state and the problems of modern civilization. Such reports as this one from Kentucky clearly show to which class this university aims to belong.

NEW JERSEY CHARITIES CONFERENCE

PARTICULAR INTEREST at the New Jersey Conference of Charities and Corrections held at Asbury Park, centered on the widows' pensions report presented by Caroline B. Alexander, a member of the State Board of Children's Guardians which administers the New Jersey pension law. After a year's work under the law, Mrs. Alexander reported 326 families pensioned, nearly 50 per cent of those applying, and 922 children kept in their homes. She called attention to the large number of feeble-minded women applying to the board and of women whose husbands had died from tuberculosis or from industrial accidents. The inadequacy of relief granted by the law, Mrs. Alexander said, made it necessary for mothers to supplement their income by work.

Although there are about 1,000 applications on file, the board has not been supplied with funds to secure more agents and ceased granting pensions on February 1. The 1914 Legislature, however, has appropriated \$8,000 for administrative expenses for the year beginning November 1.

A meeting which was particularly helpful to the large number of overseers of the poor in attendance was one dealing with Municipal Treatment of the Common Drunk. The Rev. Henry B. Wilson of Boonton spoke on the results accomplished in his town under the state law which provides for a board of protectors empowered to prepare a list of habitual drunkards, and to act as a parole board for them.

The officers of the conference for 1915 are president, Seymour L. Cromwell of the State Charities Aid Association; vice-president, David F. Weeks, superintendent of the State Village for Epileptics at Skillman; treasurer, Isaac C. Ogden of the Orange Bureau of Charities; and secretary, Ernest D. Easton of the Anti-Tuberculosis Association, Newark.

PROBATION WORK IN NEW YORK STATE

THE 123 SALARIED officers of New York city together with volunteer workers in courts and others interested in probation, met recently in a series of conferences arranged by the State Probation Commission, of which Homer Folks is president.

Among the practical problems discussed were truancy and co-operation with schools. It was the almost unanimous conclusion that truancy is a problem the schools and not the juvenile courts ought to handle. In few cities are the schools handling the problem adequately, certainly not in New York. It was pointed out.

The need of preliminary investigation before probation, especially for adults,

THREE SAMPLES OF EMBOSSED TYPE FOR THE BLIND NOW IN USE

(New York Point.)

(English Braille.)

(American Braille.)

In the original, the dots are raised, not black.

Imagine a New York business man unable to read a word in a Chicago newspaper, because the characters in which it was printed were meaningless to him. Yet a blind person, having learned only one dot system, can not read the others. The uniform type committee of the American Association for the Blind, which has been working since 1905 to secure a standard dot system, has used this striking illustration in an appeal for funds to carry on its work until the biennial convention at Berkeley, Cal., in 1915. Its final report will be made at that time.

was urged. On the other hand, loading down a probation officer with investigations to the exclusion of real probation work, which must be intensive personal work with a limited number of cases, was decried.

The annual report of the State Probation Commission showed 16,144 persons placed on probation the past year, 10,739 of them adults and 5,405 children under 16. This is 10 per cent increase over the year before and 63 per cent over any earlier year. There are 486 probation officers in the state, 52 more than the year before, 159 of them are salaried. When the commission began its work in 1906 there were only 30. The commission is working for one or more salaried officers in every county. The largest cities still without officers are Elmira, Niagara Falls, New Rochelle and Newburgh.

CHILD-HELPING WORK IN NEW ENGLAND

A RECENT tri-state conference at Boston served to bring out interesting information in regard to child-caring work in three states of New England—not the evenly progressive and modern section that many of its people might desire.

Vermont is one of the four states of the Union without a child-helping society. But the leading children's agency, the Kurn Hattin Homes near Bellows Falls, is negotiating for closer relations with the New England Home for Little Wanderers at Boston.

The Maine Children's Committee was reported to have developed into an efficient agency which, also, will work closely with the New England Home for Little Wanderers.

This institution, which is a home in a temporary sense only, as its chief work is placing-out children in families, has become the guiding force in much of the child-helping work of New England. Under the leadership of Frederic H. Knight, it has developed the most modern methods of placing-out children, and of stimulating co-operation with other organizations.

New Hampshire has just organized the Children's Aid and Protective Society. The secretary, Mrs. Alice B. Montgomery, has for several years been the agent at Northampton of the Massachusetts Society for the Prevention of Cruelty to Children. This society has an ample field, for New Hampshire, although an agricultural state with its largest city of only 70,000, stands second only to New York in ratio of orphan asylum population. Moreover, it has been exceedingly generous in its expenditures for children's institutions. Hastings H. Hart of the Russell Sage Foundation estimates that the state has an investment of \$1,600,000 in children's institutions, which is at the rate of \$3.70 per inhabitant. New York has only \$3.50. A good many children are in almshouses, the one at Hillsboro having 43.

The legislative commission to look into the condition of dependent, neglected, delinquent and defective children long ago used up its parsimonious appropriation of \$600 and has raised funds privately to go on with its study of feeble-minded children. The members are Mrs. Frank Streeter of Concord, Father Brophy and Professor Wood.

CO-OPERATIVE ASSOCIATIONS IN RURAL INDIA

GREAT BRITAIN is generally conceded to be the land in which co-operative principles were developed and in which co-operative business has attained its highest success. In England, however, the movement has been more successful among urban than among rural people. In Ireland and throughout the British Empire the condition is reversed, and agricultural co-operation shows the greater achievement.

A review of the co-operative credit movement in India, presented by Henry D. Baker in the *Daily Consular and Trade Reports*, shows strikingly that co-operation can be successfully engrafted by Britishers upon a people remote both in space and in race.

The total membership in co-operative associations of India in October, 1913,

was 573,000, an increase of 160,000 over the preceding year. There were in all 8,771 societies, those of rural India comprising a membership of six times that of the city societies.

The co-operative movement did not grow spontaneously out of the needs of the people of India, but was consciously fostered by Lord Curzon through the government of India. In 1904 an act was passed sanctioning the appointment in each province of an officer to organize co-operative credit societies. Interest rates for small farmers were shortly reduced through co-operative organization, from between 25 and 30 per cent to from 6 to 15 per cent.

The government has assisted these societies chiefly through advice, supervision, and auditing of their accounts, rather than through loans. Government supervision is largely responsible for the low interest rates obtained by these associations.

The co-operative credit societies are now being made a medium for the purchase of agricultural implements, and for the dissemination of agricultural instruction.

CONNECTICUT WELFARE WORKERS' CONFERENCE

RECREATION, the education and care of the feeble-minded, and the co-ordination of public and private charities, were given particular attention at the Connecticut State Conference of Charities and Corrections held at Bridgeport, April 26 to 28.

In the matter of recreation, Josephine Clement, manager of the Bijou Dream motion picture theater in Boston, told of her five years' experience in providing the public with a model theater. Plans for similar theaters are afoot in two other cities. Mrs. Clement declared from her experience that they are self-supporting and yield almost as much revenue and a great deal more satisfaction to the owner than do others.

Julia Schoenfeld and J. Herbert Wilson of the National Playground and Recreation Association of America emphasized the necessity of well regulated dance halls, bowling alleys and picture shows and of public playgrounds where a "spirited director is a lot more desirable than expensive apparatus."

Bringing the question of recreation home to Bridgeport, Mrs. Upham, industrial Secretary of the Y. W. C. A., said that a petition circulated in the city had brought in 600 signatures of working girls demanding dance halls where no liquor should be sold and where they might enjoy themselves in safety.

Connecticut was scored heavily for inadequate care of the insane and feeble-minded. Alexander Johnson, of the Vineland Training School, said that whereas only five acres of land in Connecticut were set aside for defective children, it would take hundreds of acres to lay out a suitable colony for this class of unfortunates.

In arguing the question of the best methods of dispensing relief, the general sentiment was that the matter of superintending charity, whether public or private, should be in the hands of

experts and that politics and changes of administrations should not affect the office.

Time was well economized at the Connecticut conference by the arrangement of "round table meetings" where various subjects were discussed which could not be taken up at the general sessions. The officers of the conference elected for 1914 are: president, Schuyler Merritt, Stamford; treasurer, William N. Travis, Stamford; secretary, Spencer Gordon, Bridgeport.

CONFERENCE OF RELIGIOUS AND SOCIAL WORKERS

A SIGN of new and better times just ahead was registered by the Council of North American Student Movements in a conference at Garden City, N. Y., of fifty of their representatives and twenty-five men and women selected as advisers because of their leadership in social thought and action. Over 1,500 groups with 125,000 students in about 1,000 American and Canadian colleges and universities were represented, all of whom have been recruited by the Y. M. C. A., Y. W. C. A. and the Student Volunteer Movement.

It was a heart-to-heart, face-to-face interchange of personal experiences and views, with no non-conducting manuscripts or set speeches intervening. It was the first of its kind, for never before had just these divergently specialized interests been represented in any conference quite so free and frank.

The most surprising unanimity found expression in the session devoted to the woman's movement, especially in recognizing it to be a new incursion of the race consciousness, and not merely the movement of a sex or class.

The theme which most deeply probed heart and conscience was The Church and the Cross in Industry. It drew forth from the depths confession of the personal conviction of the corporate sin.

The discussion of social action for college people brought out the cautiously developing deploy of undergraduates on fields adapted to their limited service. The educational and spiritual value of such contacts and co-operation with real life was abundantly substantiated.

The recommendations summing up the results of the conference for use in work with students are, in brief:

The study of social problems, with the immediate intent of establishing standards of simplicity and morality, overcoming class and racial prejudice, and the promotion of the social spirit through service in college and in the community;

The negotiation with educational authorities for the introduction of social studies and emphasis in the curriculum;

Standardizing personal and public service in legislation, administration and community action;

The study of foreign languages and peoples to fit students to help solve the problems of immigration;

The work in agricultural and normal schools to select and enlist workers for rural communities;

The inspiration for volunteer and pro-

fessional social work by group study, special lectures and co-operation with community work;

The vocational guidance by life-work conferences and personal influence; and

The practical acquaintanceship of student secretaries with the work and methods of home and foreign missionary agencies in religious denominations.

SHANGHAI AND THE OCCIDENT

—By Francis H. McLean

ONE OF THE most occidental of world movements has apparently dropped one seed in the Orient. In the treaty port of Shanghai, China, there is a campaign on foot for the formation of a charity organization society. So far as can be learned this does not involve the first experimentation in the individualization of family problems in an oriental people. Rather only the imported problems of "hobos, beach-combers, chaps who have lost their sailor papers," and the occasional permanent American or English family in temporary difficulties are in the minds of the projectors.

The pressure of such difficulties cannot fail to be diminished after a time, and one queries whether eventually there may not come a possibility of rendering some interpretation in individual family terms of the real social problems of a treaty port at the gates—nay within the gates—of this mighty but still unknown race.

REMEDIAL LOAN SOCIETY FOR DALLAS

Following the plan of the Provident Loan Society of New York and others in the National Federation of Remedial Loan Associations, a group of citizens has organized the Provident Loan Society of Dallas. A substantial part of the required capital of \$50,000 has already been subscribed.

As opposed to the extortionate charges made upon small loans by the loan sharks, the Dallas society will charge only what is necessary to pay the cost of operation and a dividend to stockholders not in excess of 6 per cent a year. Any additional profits will be used to reduce the rate of interest upon later loans. In this way eventually a large proportion of the profits will be turned back into the hands of borrowers. For the present at least the society will loan money only upon security of personal property. Later its scope may be extended to include loans upon assignments of wages.

POSTURE LEAGUE

The American Posture League has been incorporated in New York state to make an organized campaign to secure a "correct posture or carriage of the body as of fundamental importance for health and efficiency, a pronounced element of beauty and expression of energy and intelligence." Points of immediate attack are school furniture and seats in cars, theaters and other public places. The president and founder is Jessie H. Bancroft, assistant director of physical training in the public schools of New York city. Associated with her are orthopedic surgeons, physical trainers and educators. Headquarters are at 30 Church street, New York city.

HEALTH

SAVING EYESIGHT: EXHIBIT OF THE MASSACHUSETTS COMMISSION FOR THE BLIND—By HENRY C. GREENE FIELD AGENT FOR CONSERVATION OF EYESIGHT, MASSACHUSETTS COMMISSION FOR THE BLIND

THE CONSERVATION of eyesight exhibit of the Massachusetts Commission for the Blind is on the road. Clean-cut and often popular in form, its propaganda is none the less solidly based. It depicts the methods of intensive case-work, and also embodies the results of laborious research.

To the novice,—and who is not a novice in medical-social work for the preservation of eyesight?—this exhibit brings more than one surprise. The importance of syphilis as a cause of eye disablement, compared with gonorrhoea; the prevalence of possibly tubercular eye disease among children; the amount of blindness from accidents, both industrial and non-industrial, among adults; the preponderance of partial over total blindness; the possibilities of preventing blindness by organized social service, these are a few of its more salient points. The "cash value" of these facts is seldom far to seek.

"What is blindness?" asks the legislator.

"Blindness," answers the man on the street, "blindness is darkness; inability to see even the sun." Likewise say insurance companies, in more technical terms; so their phrase "total and irrecoverable blindness" was guilelessly written into the workmen's compensation law of Massachusetts.

This phrase would deny their ethical rights to great numbers of workmen with eyesight ruined by industry, were it not for facts shown in this exhibit. In graphic form, the exhibit has made it plain that the insurance phrase—a survival of the fittest in the old world of industrial iniquity—covers probably not 6 per cent of these men. But the facts were enough. The law was amended, and now stands as the one American statute granting explicitly to the victims of industry, not only medical care and compensation for time lost and reduced earning capacity, but also compensation for practical blindness, that is, for the reduction of vision to one-tenth of normal.

It would be hard to devise a more promising means of prevention. Under this new law, an eye injury resulting in practical blindness of one eye or both costs the employer, or his insurance company, from \$200 to \$4,000. As the neglect of any eye injury may make it serious, it is obviously to the interest of employers and insurance companies, first to prevent eye injuries, and then to secure prompt and competent treatment for the injuries which still occur. At least one large insurance company has already seen this point; has fixed high

standards of safety, and raised its insurance rates for careless employers.

As industrial injuries account for some 7 per cent of all practical blindness, and as one-half may probably be prevented, the importance of such work is obvious.

Though one employee in a thousand suffers serious eye injury each year, one disease finds still more victims. As the exhibit shows, to the surprise of the uninitiated, this most prevalent of serious eye diseases usually attacks children.

TOTALLY BLIND

Loss of eyesight from an explosion of dynamite in a mine.

Showing itself in raised dots (or phlyctenules) on the transparent cornea, it is christened phlyctenular keratitis. This name throws no light on the nature of the disease. In the patients themselves, however, or in their families, tubercular joints, glands, etc. suggest the probable cause. And medical opinion, both in America and in Germany, tends more and more to confirm the opinion that phlyctenular keratitis, in Dr. de Schweinitz's phrase, probably "represents one of the attenuated forms of ocular tuberculosis."

However this may be, the treatment of phlyctenular keratitis, as the exhibit shows, has given Massachusetts workers a chance for successful team play. With unwholesome food in ill-ventilated tenements, perhaps with ignorant care, children with this disease may suffer relapse after relapse, till their eyes are half blind with scars. Good food and fresh air, with special treatment for

'The Prevention of Blindness and the Instruction of the Blind Child, by George E. de Schweinitz, M.D., Philadelphia, 1912.

the eyes themselves, are the patient's salvation.

Now, fresh air and good food in happy surroundings are present and to spare at the Blind Babies' Nursery, on a height beside one of the Boston parks. What more enlightened vote then, could the trustees of the Nursery pass than one welcoming these children to share house and table and sunlit playground with the Nursery's blind charges? No sooner said than done. And as the exhibit shows, these little guests of the Nursery also have expert special care, till their eyes are beyond danger, at least of quick relapse. For last year, the Nursery reports: "Twelve such babies have gone back to their homes, not only with well eyes, but with greatly improved general health."

In the pathetic realm of infant blindness the Massachusetts exhibit gives ground for encouragement. In the agitation against ophthalmia neonatorum, or "babies' sore eyes," even medical men have made the statement that this one disease causes from a quarter to a third of all blindness. The Massachusetts figures, however, show such proportions only in schools for the blind; while among the new cases of blindness only about 2 per cent are due to this disease.

As even 2 per cent is still too high a proportion of blindness from this preventable cause, the Massachusetts exhibit illustrates one of the most thorough existing systems for still further reducing it. In half a dozen pictures it tells the story of a baby saved from the risk of life-long darkness: first, it shows us the desolate Boston alley of the baby's birth; next, the Board of Health which demands and, by prosecution, secures the reporting of ophthalmia; then one of the Board's nurses visiting the tenement to examine and report; next, the hospital by a sunny river, to which the baby is transferred; and finally, after the baby's discharge, the nurse visiting the home once more and finding the baby, not in the state of relapse against which she must guard, but clear-eyed and well.

Could a more encouraging contrast be imagined? Yet social service is no panacea for the preservation of eyesight. The results of social-medical work cannot rise above their source in the medical staff. Where the physicians of a clinic tell patients with a syphilitic disease of the eye (for instance, syphilitic iritis) to get general treatment "outside," and make no effort to keep the patient out of the clutches of quacks, the social service staff must work largely in vain. Where medical officers still diagnose glaucoma (which means certain blindness, if long neglected) and fail to have the patient "calendared" for following-up,

Drawn by Hayden Jones. Reproduced by permission from the annual report of the Boston Dispensary

the presence of social service workers in an adjoining room can do little to limit this major cause of blindness. Only where the medical staff is humanely imaginative, alert and closely interrelated with the social service staff, can such lapses give place to really efficient service.

If the percentage of patients improved and cured can be increased 23 per cent in city clinics, by the interlocking of social with modern medical work, what can be done in towns and small cities?

The Massachusetts Commission for the Blind has partly answered the question through its field worker for children. As the exhibit shows, this worker has traveled throughout the commonwealth, advising with the parents and friends of children both blind and threatened with blindness.

For some she has arranged the sightless schooling necessary to lessen their inevitable handicap. For others, born with cataract, she has won the parents' consent to those wearisomely repeated operations by which alone fair sight can be given them. For others, with phlyctenular keratitis, she has secured either expert treatment near home, or a vacation for upbuilding of general health at the Blind Babies' Nursery. For others again, whose inherited disease threatens both general health and eyesight, this worker for the state's children has found a union of constitutional and local treatment.

A map of the commonwealth dotted with red and green, suggests this field worker's achievement for a single year. One hundred and thirty-nine scattered green dots stand for the blind and partly blind children to whom she gave needed educational guidance: seventy-three red dots, in all quarters of the map, represent children for the preservation of whose eyesight she secured expert medical care. Does not this epitome of intensive "case work," in seventy-three red dots, bring the exhibit, after all, to the most satisfying possible close?

For on such a basis of minute and personal labor only can more sweeping mea-

sures of law and administration for the preservation of eyesight be firmly planned and extended.

Throughout the commonwealth all hands join, one may almost say, in the work of saving such children's eyesight. The state Board of Health distributes a preventive free, and urges physicians to report the symptoms of ophthalmia neonatorum, whether of gonorrhoeal or of other origin. Through its twelve district medical inspectors, moreover, it immediately visits every reported case outside of Boston, and advises with the local board of health as to each baby's treatment. The state Board of Charity requires the use of a preventive at every birth occurring in any lying-in hospital. It also requires that the state Board of Health be notified whenever a baby, suffering from this disease, is discharged, and deals with every violation of these hospital rules through a special agent. The Society for the Prevention

of Cruelty to Children prosecutes physicians in all parts of the state, whose negligence and violation of law have resulted in blindness; and the Massachusetts Medical Society has impressed the demand for due care on the profession by admonishing its own delinquent members. By these means, as well as through publicity, standards are being raised toward the point where really expert treatment, with the assistance of at least one trained nurse, will be demanded for every serious case.

"Team work" is the title of the commission's poster which pictures the Massachusetts Charitable Eye and Ear Infirmary and the Boston Dispensary as two sturdy horses drawing a wagon-load of children along the straight road to health. These children have all been threatened with at least partial loss of sight from a disease within the tissues of the cornea. Interstitial keratitis, the merely descriptive name of this disease, gives us no hint of its origin which is most frequently congenital syphilis. Interstitial keratitis usually occurs in children between five and fourteen years of age, who suffer from a series of apparently unrelated symptoms. Treated singularly and without reference to their underlying cause, these symptoms make the children "clinic trotters," along a zig-zag path which never leads to health.

As Miss O. M. Lewis, of the Boston Dispensary social service department, has vividly put it, such "spasmodic local treatment is like painting a house with weatherproof paint when the framework even to the sills is rotten." "A little girl of eight years," for example, "appeared at the Eye and Ear Infirmary with interstitial keratitis. The treatment was local (for the eye only). Then followed treatment in twenty-seven different clinics all over the city—nose, throat, lung, children's and surgical, as the various symptoms appeared. Because of the constantly recurring symptoms of interstitial keratitis, she was taken back and forth from one eye clinic to another for about eight months, the eye symp-

A LITTLE "CLINIC TROTTER"

Transferred from clinic rooms to out-of-doors, this little girl is being saved by fresh air and good food as well as treatment, from life long darkness.

toms all the while being correlated with no others."

Without interrupting the care of her eyes, the social service department of the Massachusetts Charitable Eye and Ear Infirmary now takes her to the special clinic at the Boston Dispensary, where the fundamental disease can be treated. The social service department of the dispensary joins with that of the Eye and Ear Infirmary in making sure that the child's constitutional and local treatment go hand in hand. The result is "that the improvement in her eyes, ears and general condition is most marked" and that the child "has been saved from partial if not total blindness."

As interstitial keratitis apparently causes fully half as much practical blindness as ophthalmia neonatorum, and many more cases of seriously defective eyesight, this experiment in team work is one of the most promising, as well as one of the newest, in organized work for the preservation of eyesight.

One of the many practical ways in which social service departments reduce this medical waste is by facilitating the purchase of glasses. The occasional stupid or obstinate opposition of parents must, of course, be dissolved in persuasion, or even broken by the "neglect law" which, in Massachusetts, requires parents to furnish their children with eye-glasses when needed.

But far more frequent than parental opposition is that combination of carelessness and poverty which leads so many parents indefinitely to postpone buying the glasses prescribed for their children. One-third, as the exhibit shows, is no mere estimate but actual waste in prescriptions for eyeglasses at an important Boston clinic. To reduce this waste and to provide school children with the glasses which so many of them need, the social service department of the Massachusetts Charitable Eye and Ear Infirmary maintains a system of loans, repaid by instalments. The exhibit shows the results of 157 such loans to needy families; no single child was deprived of glasses because of the parents' poverty, only 21 per cent of the parents could pay nothing, and 64 per cent repaid in full, in small sums weekly.

By social service follow-up work, as the exhibit also shows, the waste in eye-glass prescriptions at the Boston Dispensary has been reduced one-third in three years. And more recently, it is pleasant to note, the waste has been further reduced to 4 per cent, with prospects tending toward zero.

Still more significant in the exhibit are the Boston Dispensary figures for certain acute eye diseases. A diagram compares the numbers of single visits, (useless for the diseases in question) and the plural visits, three years ago and today. The physician in each case was the same, the place the same, the season the same; follow-up activities by a social service worker are the only new factor. The single visits have been cut down from 68 per cent. to 48 per cent; the plural visits have correspondingly increased. What is more, the results of treatment, in patients improved and cured, have risen from 63 to 86 per cent.

PURIFYING WATER FOR CITY BATHING POOLS

W. A. MANHEIMER, whose article on ceremonial baths in a recent number of *THE SURVEY* (April 18) called our attention to the danger from these supposedly cleansing institutions, has been studying also the water of New York's outdoor floating baths. The city maintains during the summer about fifteen free floating baths. These are stationed at docks as far from sewer outlets as feasible, but that may be not further than 500 feet or even less.

Mr. Manheimer has often found particles of fecal matter from the sewers floating in the water and could always find as many as 100 colon bacilli to the cubic centimeter of water, while the general bacterial count ran up to half a million or a million. Yet these free baths are greatly patronized by the public, children as well as adults.

The Metropolitan Sewage Commission recognizes the unsanitary condition of these baths and has recommended that they be abolished, but it would be hard to do this without providing a substitute. The suggestion that the city remodel them into baths, using Croton water, involves an enormous expense. Mr. Manheimer recommends that the river water be used but the baths made water tight and the water pumped through filters. Gross impurities being thus removed, bleaching powder, chloride of lime, could be added to destroy bacteria. It is a pity, however, to put so much money into baths which can be used only a few months in the year; so Mr. Manheimer suggests that the pools be constructed at the ends of recreation piers and eventually roofed over and warmed, in order that they could be used in winter as well. There seems to be a preference on the part of bathers for salt water, and San Francisco has shown that sea water can be effectively disinfected by chloride of lime. A recent report of the U. S. Public Health Service tells us that the big swimming pools of salt water in that city are now being disinfected by this method. It is also in use in many big bathing pools of fresh water in colleges and gymnasia. The most interesting instance of its use in fresh water is said to be the disinfection of "Bubbly Creek." This is an unspeakably foul, polluted stream which drains part of the stockyards of Chicago, but which for much of the year has practically no current. Chloride of lime in the proportion of 45 pounds to a million gallons of water is said to have made this water even more germ-free than the drinking water used in Chicago.

A STATISTICAL STUDY OF MEASLES

MEASLES has not generally been "taken seriously." Indeed, a certain health officer is quoted as recommending that strong, healthy children, under careful control, should contract measles "to escape the malignancy of the disease in adult age."

Yet according to a recent study by Dr. F. S. Crum, of the Prudential In-

surance Company, 1 per cent of all deaths may be traced to measles, and 1 to 6 per cent of all cases of measles are fatal. It chooses its victims especially from children under ten years of age, but occasionally attacks an adult. It shows no preference of sex, locality, race or climate, but since the time when any records were kept of causes of death, "has levied a heavy toll on the populations of civilized countries. . . ."

There are, says Dr. Crum, "authentic records of great epidemics of measles in England and Scotland from the early part of the seventeenth century; and after Sydenham's description of the London epidemics of 1670 and 1674, there remains no doubt of the more or less continuous and wide havoc wrought in Great Britain and Europe by this particular form of eruptive fever. Epidemics of measles were frequent, widespread and fatal throughout the eighteenth and the nineteenth century."

Some findings of Dr. Crum's investigation are recorded in the *American Journal of Public Health* for April and the report is supplemented by charts. One of these charts shows a century of decennial averages of deaths from measles. Among children under ten years, the highest rate occurred in the decade 1882-1892; the lowest, in that of 1902-1912. Yet, it is stated, measles is now more widely diffused, even in rural districts, than in the fifties and sixties of the nineteenth century. Records from fifteen American cities show a fairly definite periodicity in epidemics of measles, these recurring apparently at intervals of from three to five years. Morbidity has been greatest during the spring months, although the percentage rises again in November.

One chart, based upon conditions in Glasgow contains an especially significant message for many a city of any land. In the Scottish city a close relation was found between attack-rates and housing conditions. Where the children belonged to families living in one-room tenements, the rate was ten times as high as where the families lived in three or four rooms or more.

Some reasons for the present inadequate sanitary control of measles which Dr. Crum mentions are, our incomplete knowledge of the virus, the infectivity period previous to eruptive appearance, general opinion of the harmlessness of measles, and its wide diffusion and high contagiousness. The best control will result from co-operation between parents and officials of schools and health departments. Dr. Crum emphasizes the need of overcoming ignorance and of pointing out the frequent complications and after effects of measles.

WITH BLUE PENCIL

A correction is needed, we learn, in our note which accompanied the interesting chart reproduced in *THE SURVEY* for April 18, page 79.

This chart was prepared by the Boston (not Massachusetts) Association for the Relief and Control of Tuberculosis to show the decrease of tuberculosis in Boston,—not as stated, in Massachusetts.

THE Washington alley bill—designed to eliminate one-tenth of the alley dwellings in the capital annually during the next ten years—is now receiving serious attention from Congress. The vigorous educational campaign carried on by local, civic and social organizations has made senators and representatives look some disagreeable facts in the face until they are recognizing what the facts mean. But there is serious danger that an easy way to get a superficial improvement may be adopted instead of the more difficult way that leads to permanent improvement.

The alley bill provides for converting alleys into minor streets which will furnish suitable sites for small houses. This presents certain legal and financial difficulties, especially in Washington where the cost of improvements is usually divided between the district and the national governments. Questions asked by congressmen at the public hearings on the bill indicated a desire to side-step these difficulties. The burden of these questions was: Why not simply forbid owners to permit the use of alley buildings for dwelling purposes? Then it would be up to the owners to find another use for these structures while the governments, local and national, would escape all trouble.

There could be no better illustration of short-sighted legislation than is foreshadowed in this proposal. It concerns itself solely with the single eye-sore which has been forced upon public attention and calmly disregards all that experience might teach as to the inevitable results of such inadequate legislation.

Most of Washington's inhabited alleys run through unusually large blocks. This means that the lots are deep. The alley dwellings have furnished the owners a means of utilizing the rear ends of these deep lots. A simple prohibition will force the owners to seek some other means of utilizing their land, and the inevitable result will be the erection of deep tenement and apartment houses extending far back from the street. So in future Washington will be in even worse condition than at present.

If, however, the alleys are converted into minor streets the owners will cut the deep lots in two, with two frontages, and Washington will remain, what we want all our cities to be, a city of single family houses.

SPRING AND THE RURAL SOCIAL WORKER

FRED EASTMAN

SPRING sometimes means to the rural social worker mud and sleet and snow and the grippe, meetings poorly attended or called off entirely, scarcity of money, and aggravated distress among the poor and unemployed. Heaven knows this spring had plenty of all these in the northern states!

But this spring brings with it also a promise so great in importance to the rural worker that snow and mud and grippe are forgotten. It is this: A social consciousness is awakening in country villages. It is expressing itself in the formation of neighborhood, community and taxpayers' associations in hundreds of valleys where a few years ago neighbors lived side by side, each boasting his independence of the others. Hardly a newspaper but records this spring among its rural notes the fact that farmers and villagers of this community and that have been getting together. They are coming at last to see that to be the best sort of citizens they must not only be producers but co-operative producers; they are waking to the fact that the community's business is everybody's business and should be conducted in a business-like way.

In the vicinity of New York no less than twenty of these organizations are sprouting. Some of them like the community club near Suffern are in the open country stimulating better farming and better transportation facilities and better schools. Others like the Roslyn and Huntington associations are devoting themselves to the physical and social welfare of villages. Doubtless some of these organizations beginning under weak leadership, too timid to tackle anything larger than the task of picking up papers, will be nipped in the bud by spring frosts. But the majority have a prospect for usefulness almost unlimited.

What one of these organizations can do in a community is exemplified by the Matinecock Neighborhood Association at Locust Valley, N. Y. After six years of work this association can now look back upon a list of tangible results: A road macadamized largely at the expense of the association; a self-supporting library of 2,000 volumes with a monthly circulation of more than 400, and \$600 in the treasury; kindergarten, sewing, cooking, music

and manual training classes introduced into the public school; railroad station grounds beautified and cared for, gardens planted around the homes of school children; an anti-mosquito campaign each year, draining or flooding swamps and stagnant pools; a bathing beach and cottage leased for the people of this community, and the town persuaded to vote \$10,000 for a bathing pavilion; a recreation department founded which today furnishes recreation to the community and has a membership of seventy young men; a band of twenty members; an employment department; a permanent office near the railroad station under the charge of the secretary and a stenographer; the church revived and started on a new lease of life; a social survey; the music of the community consolidated under a music secretary; a successful campaign for \$24,000 for a neighborhood house completed and the Neighborhood Building built by a co-operative method of construction with a large amount of volunteer labor.

Doubtless other organizations have done as well and better. Doubtless, too, organizations just started will have to battle for their right to survive. But an awakened social consciousness will not take long to prove its right to existence. If the promise of the spring is fulfilled a happier day is dawning for life in the American village and countryside.

HOW WE KNOW IT'S SPRING IN A CITY NEIGHBORHOOD

OBSERVATIONS BY THE RESIDENTS OF SOUTH END HOUSE, BOSTON,
BROUGHT TOGETHER BY
ROBERT A. WOODS

HOW can one think of spring without its music, its pageantry, its upward swell of life? How few and how tantalizing seem to be the ways in which it can express itself in the tenement streets. The pussy willows and sprouting branches in the school room may give the children some faint intimations of the world of nature outside. But the scent of a long yellow catkin in the soft green of a willow stem is not one of the possessions of a city child. Can anything make up for it? His instinctive zeal for making good his losses is surely not absent. What the rushing, emancipated brook beside the woods would mean to him is shown by his delight in the muddy pool of water which has been dammed up by some chance excavation work in the street.

Nature in captivity begins to appear in the early budding of the pathetic trees in the back yards, among whose dust-begrimed branches the sparrows, in feathers soiled by the touch of their surroundings, are foolishly making their nests just where boys' hunting instincts will most quickly discover them. The wagons exposing potted plants for sale bring to some of the homes a ray of the gayety of the season, and the little fenced-in parks begin to draw people to catch some of the fragrance of the new life in the ground and see something of the new green shoots among the grass. Italian women have been known to bring

back joyously some dandelion greens from such a little country.

The children are all life and motion, though they are so completely deprived of the materials and background which is their birthright for the celebration of the season. Marbles is for every city boy the first pragmatic mark of spring; somehow to an old timer the game in many of its variations seems to have lost as a test of skill and precision, but to have gained much in the peaceful spirit with which it is conducted. Tops are not spun with the intensity of purpose which once characterized this pursuit; and hopscotch is a decidedly more languid matter. On the other hand, rope is skipped with a variety of figure which befits a more progressive epoch; and the football season is long anticipated, with a bit of rubber hose leaned against the curbstone to serve in place of the pigskin. In odd corners, younger children are found reviving some of the ancient ditties, with action to match, which have come down by child lip tradition all the way from Sanscrit days. The sound of the hurdy-gurdy is again heard in the land, and a new instalment of recruits for the dances of 1920—whatever they may prove to be—are striking their first paces.

The spirit of expansion is abroad. Spring does not bring fulfilment in school to boys whose hearts are of the season. Truancy in spring has an atmosphere of reality, almost of dignity, about it. The evil of such doing is now peculiarly far from the thoughts of the young offenders. "Committing reverie" they are—a reverie caused by the touch of the year's awakening, and the wonder of it; and they go about with a wistful expectation that something more of this fresh wonder will shine out in the brick-lined streets.

The street occupations are partly transformed. The cries of the city are again in our ears. After a dreary and anxious period of waiting, the solicitor of rags and bottles enters into his season,—his droning, persistent appeals, with the curious rising inflection, calling to mind the old-established ethical controversy as to the true logical relations existing between poverty and drink. The small peddler begins to think of changing coal for ice as a medium. The season for hucksters is still somewhat distant, though the Italian peddler of oranges and bananas becomes more confident as he finds a tendency among the children to come nearer to nature by giving his wares some consideration as against candy and gum. The demand for cucumber and lime pickles at the little store near the girls' school reaches its height; and will some divining interpreter please tell us why girls have such a strange fondness? A new building enterprise here and there creates a much observed continuous performance to absorb the leisured in the contagion of a work atmosphere.

There is a general sense that the rough outdoor labor performed by so many of the men, precarious at best during the long winter, is now beginning to present a favorable outlook. More teamsters begin to find employment. Building laborers become involved in long contract jobs.

Extra city men are called into service repairing or cleaning the streets. Even those whose immediate outlook shows no improvement catch the spirit of the season. Another winter has at least been lived through, and there is hope, if not prospect, of better things.

Let anyone who does not yet have this feeling, join the much enlarged procession of those who now begin to walk to their work. The human organism itself has an inward sappy feeling which induces to striding activity in the quickening, comforting sun and air. Did anyone ever urge in favor of beginning work early that it compels a few city people to retain the values of such acquaintance with the first two hours of a spring morning as even the city's version of it can set forth?

The immemorial tradition that the possibilities of change for the better in home environment should occupy the thoughts of the housewife, is everywhere observed according to one's means and lights. There now begins to be some certainty that windows will be opened. The settled, heavy sense of confinement is about to be sloughed off. The dust and impediments of the hibernating period now seem really out of place and out of the question. A fine feeling of superiority in respect of cleanliness expresses itself in the attitude of those who make a good start and a strong finish. A bustling determined little Jewish woman on her knees cleansing paint, looks up with a promise of real hospitality during the religious holidays, to say, "It was a wise God who gave us the law to do this once a year. I learn that from my near neighbors what do not do so." An Irish woman apologizes because she could not go shopping, make Easter clothes, and clean up, all at the same time.

PERHAPS the order in which these duties are placed may suggest a difference in religious background of two races—one finding its sanctions in the home; the other, in the more formal conventicle with its more varied and more exceptional associations. In either case, the spiritual meaning of the clean and bright exterior of habitat and habiliment surely lies deep in every vernal impulse. Happily this resulting ethical force often brings the neighbor to a spirit of effective rebellion. Many a moving is resorted to as an alternative preferable to the hopeless labor of cleaning up. Otherwise, landlords are appealed to with unusual determination, or the citizen for once in a way asserts himself, as against nameless risks, in a demand upon the Board of Health.

The general bursting of winter's bonds leads to a quickening of established acquaintance, the opening of fresh relations with old neighbors and new, and a considerable unconscious growth of common interests. Outdoor "ridding up" activities, and doorstep parties on warmer days, widen the scope of neighborly intercourse. They add to the subject matter of neighborhood gossip, while giving it a genial touch. A readiness not only to live but to let live is in the air. Yet increased contact brings also a certain added sense of re-

sponsibility; and some of the great problems of neighborly responsibility rise to a new height in the spring. Strangers from over the sea come in much larger numbers, and the inveterate human tradition that a stranger is an enemy goes on the wings of rumor up and down the streets. The impetuous stirrings of the power of life in the veins of youth and maiden bring into many narrow homes a higher pitch of helpless anxiety, as the seclusion which courtship requires—impossible in the winter's crowding—is found after nightfall in the shadows of deserted factory streets.

LIFE is most like a battle in winter, and winter in a tenement neighborhood seems often to exhaust the grimness of the figures. Spring seems to bring the natural order out as an ally, opening up a new vision of things possible in the quality of life, a new sense of equalness to moral responsibilities. The settlement nurse says that she finds it easier to elicit in wives and even in husbands a sense of really personal interest and care regarding expected babies. It is perhaps as the inspirer of a fine curiosity, and of the impetus for demanding life, that our people, with only high-walled grooves in which to move back and forth, and living too closely within for either society or privacy—chiefly miss the glory of unfolding nature in the open country. Le Gallienne's saying that "one branch of hawthorn against the spring sky promises more than all the summers of time can pay" suggests that there is a certain intoxication in the fullness of such a privilege. Its results, however, are the measure by which human nature will always estimate its not-to-be-denied destiny.

It flashes and burns into the mind an irrevocable sense of the inadequacy of the whole physical setting of life in our neighborhood, of the precarious monotony of its labor, of the sordid allurements which beset its pleasures. Spring is the season in which most of the world's revolutions have begun. It should bring to all of us in our neighborhoods in our different degrees a clean and high resolve that uncompromisingly, albeit patiently, whatever of the old order of our thought and work may need to be overturned, we will strive that all may have light and air and space, a due supply of material goods through worthy labor, and that true joy of life which is one of the chiefest means of grace.

But we surely miss the deepest import of what the spirit of this humble commune has to tell us if, in our zeal for measures and systems, we make little of the wonder and the power of the life that contrives to be lived even now with most of the horizon shut off. Only as the whole being of each person at the doorstep or on the corner is drawn out to its full present limits, only as it is by its own choice and conviction vitally inwrought into all our social enterprises and aspirations, shall we move toward the new spiritual order of neighborhood, city, nation,—shall we as a people come to have a deep-lying renascent energy, like that of nature to displace with verdure all the husks of a former season.

Communications

JUSTICE AND MERCY

TO THE EDITOR: In each one of the past seventy years I have spent some of my time at factory work. And now, at seventy-eight years of age, as, somewhat aloof from the activities of life, I read *THE SURVEY*, and ponder, I experience much satisfaction. It gives me evidence of the "newer compassion" of which Jane Addams speaks; also of the truth of her statement "that a new humanitarianism has arisen" and that, as it seems to me, there are some, at least, who hold that justice and mercy are inseparable.

AMOS SHEPARD.

PEACH BLOOM

TO THE EDITOR: In *THE SURVEY* for March 28 there appeared a very severe criticism of Peach Bloom, a drama by Northrop Morse. Some weeks ago I read this play with much interest and hoped *THE SURVEY* would recommend it to its readers. In your review, the moral lessons, well worked out by the author, are entirely passed over, namely, the danger of ignorance for young girls and the difficulty in getting white slavers prosecuted.

Should not an organ, actively engaged in the protection of girls interest its readers in so valuable a contribution to the cause as Peach Bloom?

HAZEL PIERCE HUICKS.

Coyote, California.

ILLINOIS WOMEN VOTERS

TO THE EDITOR: As an old subscriber to *THE SURVEY* my name was on your books when *Charities* was a four-page leaflet—I beg to protest against Graham Taylor's article on Illinois Women at the Polls in your issue for April 18.

There are different deductions drawn from those elections by people quite as well informed and as conscientious as Mr. Taylor; and it would seem more worthy of the dignified standing of *THE SURVEY* either to give fair-play expression to the opinions on both sides, or else to present a perfectly neutral statement of the bare facts of the case.

GRACE NICOLL.

New York.

CHICAGO'S GARBAGE

TO THE EDITOR: I have just noticed in your issue of March 21, the statement in your article on the Chicago garbage situation: "The city resorted to the primitive plan of dumping the garbage in clay holes, the work being supervised by the Department of Health."

This gives an entirely erroneous impression, since the natural impression

is that the garbage was merely dumped in excavations and left exposed therein.

The facts are quite otherwise. A small part of the untreated garbage, that from sections so located as to preclude other treatment for the time, was mixed with ashes and rubbish, deposited in excavations, and covered. About twenty-five tons per day were destroyed in the incinerator at the Bridewell. The remainder, varying from 180 to 310 tons per day, has been handled at the temporary disposal station on the North Branch, just south of Grace street.

This plant was inspected not long ago by three well-known sanitary engineers, and very strongly commended, both for the efficiency of its results and the economy of its operation, the cost per ton disposed of being \$1.49.

G. B. YOUNG.

[Commissioner of Health.]

Chicago.

"BEAUTY FOR ASHES"

TO THE EDITOR: May I add my own to the many commendations which you must have received for the publication of "Beauty for Ashes." My wife has read the instalments thus far published to her group of Camp Fire Girls, and it has held them spellbound.

They do a good deal of reading together and I feel that it is an occasion for encouragement that the things which have influenced them most thus far have been Mary Antin's *The Promised Land* and Mrs. Bacon's "Beauty for Ashes."

The next generation promises to afford a good type of Christianity if we can catch them young.

Rev. WALTER C. JONES.

Waitsburg, Wash.

SOCIAL INSURANCE, PENSIONS, AND POOR RELIEF

TO THE EDITOR: It is essential to clear thinking on the problems of social insurance to distinguish that method of providing against personal disaster from a pension system, and this again from charity. The principle of insurance is entirely familiar. Men and women whose income, wage or salary is dependent upon their own physical or mental ability, may provide for periods of incapacity, due to sickness, accident, unemployment or old age, by making regular payments during the years of normal earnings into a common fund, with the contractual right to draw upon that fund when overtaken by incapacity.

This method of distributing risks has been adopted not only by insurance companies with a view to absorbing a

profitable proportion of the premiums paid in, but by trade unions and friendly societies of all degrees of solvency. Under social insurance, the state or the community comes to the aid of wage-earners whose revenue is insufficient for adequate insurance by contributing a considerable proportion of the premium payments and, in case private companies are permitted to negotiate the policies, by requiring adequate financial safeguards.

How thoroughly beneficent social insurance may be in providing against industrial disaster is being proved by the British system of insurance against unemployment. Where charity and public works, conscientiously and wisely administered, had only aggravated the evil, state-aided insurance is serving to stimulate foresight on the part of employers, employes, and the associated trade unions. Old age is a universal incapacity and one that may endure for years, and therefore an adequate insurance premium may be justly thought beyond the reach of the low-paid workman. Nevertheless old age insurance is required of the wage-earners of Germany, and Sweden is this year inaugurating a universal requirement. Denmark, on the other hand, has for many years provided, out of state and communal grants, pensions for such of her superannuated wage earners as are deemed worthy of such honor. Those deemed unworthy are cared for in appropriate institutions. The Danish system affords sharp contrast to the British old age pensions which are granted with slight regard to the previous record of the applicant. One is fain to ask, What is the difference between an old age pension so administered and out-door relief?

In general usage, a pension is granted for honorable service. Pensions are so granted to employees by business corporations, such as the Pennsylvania Railroad, and by city governments to superannuated members of the police force and to teachers who have served a long term in the public schools. The original design of our Civil War pensions was ignored when the requisite of honorable service was dropped and a pension came to be allowed to any man who had worn the colors, no matter what his record.

Army and police pensions are intended to attract recruits to an extra-hazardous service, teachers pensions and the pensions accorded to government employes in most European countries serve as offset to inadequate salaries. The Carnegie pension for college professors was offered in the hope of inducing able men and women to enter upon a poorly paid profession as a life work. The proposition to make such pensions contributory, if carried into effect, would tend to frustrate the original design. To confound a pension system with social insurance or with poor relief is to minimize the effectiveness of this admirable method of rewarding prolonged service.

The ultimate test of the wisdom of the various forms of public provision for destitute old age must be, not merely the comfort and gratification of the indi-

vidual concerned, but the influence on the moral fibre of the community. Insurance necessitates regular earnings and must eventually contribute to an advance of the wage scale wherever it is generally practised. Thrift is an old fashioned virtue, but it is still an essential element in race efficiency.

In criticising my account of the operation of the British old-age pension act in *THE SURVEY* of February 28 (p. 672), Dr. Rubinow confounds thrift with parsimony. Thrift is not merely "getting along without things which we need," but rather making the best use of all we can earn. Provision for old age is a need which, as Dr. Rubinow suggests, a young man does not keenly feel, and on this psychological fact rests the argument for compulsory insurance. A pension system, on the other hand, if it is to serve its highest purpose, must emphasize character, another national asset we cannot afford to ignore.

The honorable status of the Danish old-age pensioner contributes in no slight measure to the industrial energy of that remarkably efficient little commonwealth. As for the old men and women whose wages have been insufficient for insurance and whose life will not warrant the award of a pension, they will not be "permitted to starve or freeze on the streets," as Dr. Rubinow seems to fear.

There are public and private institutions for every form of mental and physical incapacity, there are poor houses for the incorrigibles and outdoor relief for the old men and women whose presence in the community contains no menace to health or morals. The prime necessity of public benevolence is the scientific classification of the persons to be benefitted, so that each may be assigned the remedy appropriate to his need. This is accomplished in Denmark and in certain poor law districts of England.

The promoters of the recent legislation in Spain made a careful study of the old-age pension system of Great Britain, compulsory insurance in Germany, and voluntary insurance against old age as then operated in France, Italy and Belgium and came to the conclusion that the Belgian system was best adapted to Spanish conditions. National conditions should be taken into account, not only in drafting social legislation but in estimating results.

The fifty thousand persons already insured under the *Instituto Nacional de Prevision* represents a remarkable victory over the complete ignorance of the first principles of insurance and the ingrained suspicion of the motives of officialdom characteristic of the Spanish workmen. That which is really admirable in the provisions of the Spanish law and its administration by the *Instituto Nacional* is the ingenious campaign of education among wage-earners and the readiness with which business corporations have agreed to co-operate with their employes and the state in this endeavor to mitigate the terrors of old age.

KATHARINE COMAN.

London, England.

JOTTINGS

BALTIMORE 1915

Baltimore is making an earnest effort to secure the 1915 session of the National Conference of Charities and Correction. Already more than the amount of money required by the conference has been raised by subscription. Baltimore has not entertained this conference since 1890 and a meeting has not been held on the Atlantic seaboard since 1911.

PHILADELPHIA PIGS

The Philadelphia pigs—of the four-footed variety—are squealing again. The judges have handed down their decision sustaining the city in its contention that stacks of pig manure in the rear of dwellings constitute a nuisance. Although the Philadelphia Live Stock Association is appealing from the decision, the Bureau of Health is serving ten days' eviction notices on batches of pigs. A few hundred more will have been driven out before the judges can hear the appeal. If the appeal is granted the pigs will have another reprieve. *THE SURVEY* in its issue for March 14 reported too many pigs in Philadelphia. There are only about 20,000 instead of 200,000.

RURAL VISITING NURSE

The first rural visiting nurse in Pennsylvania is claimed by Muncy, a town of 2,000 in a farming and hill country. This activity was promoted by the Pennsylvania Rural Progress Association; the original \$150 was contributed by the

state Y. W. C. A., \$350 was given by two local manufacturers, and the remainder raised among citizens of the region. The nurse has been at work now eight months, and aided by the cordial co-operation of the doctors is already a *sine qua non*.

INTERNATIONAL CONGRESS

The next (Sixth) International Congress on Social Work and Service is to be held in London the week ending June 5, 1915 at the University of London, South Kensington. The questions to be discussed at full meetings are:

The influence which, in accordance with modern ideas, thrift and providence should exercise in questions of assistance. General reporter, M. Van Overberg of Brussels.

International provision for the assistance of deserted or morally abandoned children. General reporter, M. Ferdinand-Dreyfus of Paris.

The assistance of families of prisoners and extradited persons. General reporter to be selected in Germany.

The care and control of mentally defective persons, other than certified lunatics. General reporter, Sir Bryan Donkin.

All questions but the last, which was the choice of the British committee, were selected by the international committee. At sectional meetings the following subjects will be submitted:

The reciprocal influence of state insurance schemes and the provision and management of hospitals.

The relation of the municipality to public and private assistance.

Public subsidy and the housing of the working class.

The organization and administration of the work of school care committees.

New Shirts

Reg. Trade Mark

We are now showing a range of some 1,200 different designs suitable for Men's Shirts and Pajamas, Women's Dresses and Blouses or Children's Garments—as follows:

French Madras in new stripes, Jacquard figures, cords and dimity effects, also French Percales. 32 in. wide, at 28c., 35c., 40c., 45c. and 50c. yard.

French Crepe Shirting and Satin Broche, the correct fabrics for soft cuff Shirts. 32 in. wide, at 50c., 55c. and 65c. yard.

Silk and Cotton Madras in a most beautiful range of new and exclusive styles. 32 in. wide, at 50c., 65c. and 95c. yard.

Washable Silk Shirts, in new and novel effects, staple stripes or satin effects. 32 in. wide, \$1.00 and 1.25 yd.

Real Japanese Habutai Silks in staple or two-toned stripes. 31 in. wide, at \$1.25 yard.

"Peau de Crepe", a heavy, all-silk fabric, most popular for Shirts or Blouses, in a fine range of designs. 32 in. wide, \$2.00 and 2.25 yard.

Silk Crepe or Crepe de Chine, a heavy quality, will launder beautifully, Novelty stripes. 32 in. wide, at \$2.25 yard.

Viyella Flannels (unshrinkable), in a new range of Spring designs. 31 in. wide, at 68c. yard.

English Taffeta Flannel, Wool and Silk mixed, a most desirable cloth for Shirts or Waists; comes in a range of new striped designs. 31 in., at \$1.15 yard.

Samples of any of the above lines mailed free on request.

INDEX NOW READY

☞ Index for Volume XXXI of *The Survey*, from October, 1913, to March, 1914, inclusive, will be sent free on application.

☞ Bound volumes, in stout cloth with leather back and covers, \$2.50 plus postage.

☞ Survey binders, for the current issues, handy and serviceable, \$1.00.

The GIST of IT—

FOR a second time the National Conference of Charities and Correction has elected a woman as president—Mary Willcox Glenn. John A. Ryan, professor of economics at St. Paul Seminary, was elected first vice-president. Mrs. Glenn is a member of the executive committee of the New York Charity Organization Society, and is chairman of the Clinton District Committee. As Mary Willcox Brown, Mrs. Glenn was before her marriage secretary of the Henry Watson Aid Society and of the Charity Organization Society of Baltimore. She is the author of a book entitled *Thrift*. The conference will meet in Baltimore in 1915.

DECLARING that they can better aid the Colorado strikers by remaining at work, thus insuring them financial assistance, the special committee of the international executive board of the United Mine Workers of America voted May 8 against a general strike. They added that if conditions in Colorado do not improve they may change their minds, and they called upon the membership everywhere to hold itself in readiness.

MEANWHILE disarmament alone will not bring peace, says John A. Fitch. That will come only when there is protection to liberty to enjoy the fruits of toil. Page 205.

THE telegraph editors' interest in Mexico and Colorado kept many people from realizing that 180 coal miners were blown to death in West Virginia a fortnight ago. Five of them were boys, for West Virginia allows its fourteen-year-olds to work in the mines. Page 194.

ST. LOUIS is to have clean milk. Page 190.

WHEN Andrew Jackson was president and friction matches had just been invented, six years after the first railroad and forty-two years before the first manual training school was started in Boston, David Lyman introduced "learning by doing" in Hawaii. The school he founded is to-day teaching citizenship to boys of fifteen nationalities. Page 197.

A FEW years ago three-tenths of the applicants to distress committees in England were under thirty. Many of these were recruited from the ranks of blind alley boy workers, who risked "useless at twenty-five" for their industrial epitaph. To-day the labor exchanges are diverting them into vocational thoroughfares open at both ends. Page 195.

SEVEN months' tests of the 8-hour day for children in Massachusetts. Page 189.

THE SURVEY

COMMON WELFARE

RESULTS OF AN 8-HOUR LAW FOR WORKING CHILDREN

LAST YEAR Massachusetts gave to boys and girls under sixteen the eight-hour day already secured by most adult public employes and skilled adult workmen and by these young workers in sixteen other states. The law was enacted after two years of deliberation which brought out all conceivable arguments on both sides.

The strongest point made by the opposition was that the children would not receive the benefits of the law because they would be discharged—they would be driven into idleness and crime and their families would suffer from the loss of their wages. The law has had seven months' test. Of the 30,000 children under 16 at work before it went into effect, 28,000 were at work in December, 1913, as shown by the statistics of employment certificates issued. Most of this readjustment to eight-hour schedules had been completed in October.

Reports from attendance officers throughout the state show that there has been no increase in idleness and crime and that the few children displaced have returned to school as the law requires.

To determine if there had been an increase in family hardship, the Board of Labor and Industries sent an inquiry to all public and private charitable agencies in the state. They report only five cases where permanent aid had been necessary and eleven cases where temporary aid was necessary.

Investigations made by the Massachusetts Child Labor Committee, of which Richard K. Conant is secretary, show that under the eight-hour law children have more time to play, to read and to rest. The stories of children told to the committee's investigators, are interesting evidence:

Gene —, age 15; interviewed September 30, 1913; hours 6.45 to 3.45. "Had you rather work ten hours than eight?" he was asked. "Oh! no, ten hours is too long, it seems as though I never see the afternoon go by. Am so glad to get out early in the afternoon

and get a chance to play out of doors."

Francis —, age 15, interviewed September 24, 1913; earns \$6.50; hours 8 to 12 and 1.30 to 5.30. Francis was discharged from the — mill on September 3. The same day he obtained work in the — mill, his present position. He earned \$7.70 previously as a back boy but likes his present work as battery boy much better. He likes the new hours and does not mind having less pay. Francis was seen playing ball at 1 o'clock. He was enjoying his nooning playing with some of the school boys. The boy who "spells him off" works from 7 to 11 and 1 to 5. Eight or nine other boys and girls under sixteen work in the same room with him.

Occasionally children were found who said that they preferred the extra pay and were willing to work ten hours for it, but fully three-fourths of those interviewed told stories like the above.

The committee believes that the law has worked as well as could be hoped and that it has accomplished just what was intended—lightening the burden of over 20,000 children.

THE CHILDREN

ROY TEMPLE HOUSE

A Gascon village and the Civil Wars.

The hostile vanguards, marching east and west,

*Come flat together in the market-place
And lift their guns in concert. But
the square*

*Is black with little eager Gascon heads
Of children busy at their games. A
pause—*

*Then some one stirs, and cries the
word for all;*

*"Tiratz lus drollés" Get the children
out!"*

*A noble speech. But is it always so?
Our air is full of poisoned, flying
shafts*

*That kill more surely than French
musket-balls—*

*Of hate and malice, and black trickery
And sweet temptations that grow foul
as death.*

*It cannot be that we have less of heart
Than that old bitter partisan, who
stayed*

*His comrades' hand and braved his
foes', to cry*

*"Tiratz lus drollés" Get the children
out!"*

LABOR EXCHANGES FOR CINCINNATI HANDICAPPED

A CO-OPERATIVE ATTEMPT to aid the handicapped has been undertaken by the state of Ohio, the city of Cincinnati and private organizations. A department for them has been established in the State-City Labor Exchange, the new name with which the Ohio Industrial Commission has dubbed its old free employment agencies.

The commission thinks there is sometimes something in a name, especially when a new name signifies a departure from the inefficiency marking the old employment bureaus, to long-headed plans for finding jobs.

In harmony with its policy of joining forces with the municipalities wherein employment agencies are located, the commission has placed its local labor office in the City Hall, combined it with the city employment bureau, and given the superintendent of charities and correction supervision over it. Following a second policy of emphasizing those features of particular interest to each community, a division for the handicapped has been added. A vocational guidance bureau, under private auspices, is to be added also.

The department for the handicapped brings to fruition efforts of the Hospital Social Service Commission extending over a year. In order to focus public attention upon the problem, a survey was made of the three thousand handicapped persons of the city. One thousand cases were singled out for intensive study. Seventy-two per cent of these were either breadwinners or probably would have others dependent upon them; 57 per cent had years of life before them and seemed capable of adjusting themselves to economic independence with proper assistance. An inquiry carried on among a large number of factories showed that although only a few hired handicapped employes, many were willing to try them.

The special department of the labor exchange is to be conducted by a trained social worker who has been selected by the social workers of the community at

the Industrial Commission's request. His work as outlined is to fall into these divisions: First, he is to study the industrial field and find places where the handicapped can be safely placed. Then he is to make a careful study of each individual applying for help with the assistance of clinics, with a view to finding out his capacity and limitations. And finally the careers of those employed through the bureau are to be followed until they are firmly established.

PURE MILK ORDINANCE PASSED IN ST. LOUIS

St. Louis has just scored a big victory for clean milk. The Municipal Assembly has almost unanimously passed the bill drafted by the board of health and supported by a score of civic and social service organizations of the city and by the *St. Louis Republic*, which has been waging an active health campaign.

The bill provides for the same rigid standards for milk as are recommended by the federal Department of Agriculture. All milk dealers hereafter must register with the Board of Health, which has full power to grant and revoke permits.

The chief provision, however, is that one year after the date of passage, all milk sold in St. Louis must either be pasteurized by the Held method or come from cows inspected by the Board of Health.

The bill was endorsed by the large milk companies, which receive their supply from outside of the city, and which pasteurize practically all their milk. It was bitterly opposed by the city milk dealers. There are 1,750 cows kept within the city limits of St. Louis. No new dairies have been allowed for a number of years. The dairies now within city limits are survivors of the days when much of the city area was in farm land.

EXHIBIT OF BETTER INDUSTRIAL RELATIONS

THE EXHIBIT of Better Industrial Relations, held the past month in New York city by the business men's group of the Society for Ethical Culture, proved striking and interesting and may be set up in other cities.

Visitors could scarcely fail to be impressed with the display of a firm of Boston merchants six of whose eleven directors are employees; of the paint factory managed jointly by a factory committee and an office committee; or of the labor union which has raised the average quality of work in a whole trade and established a system of industrial education.

One poster read: "Tell your troubles to the grievance board; there's a member on every floor." Next it hung charts describing methods of settling industrial disputes in New South Wales, France, Canada and some establishments in the United States.

The problem of seasonal unemployment was shown to have been met by two firms by varying their products. One manufactures belts part of the year and suspenders another part, while a large shoe firm keeps running the year round by special attention to sales and alteration in types of shoes.

There were interesting exhibits of profit-sharing, bonus systems, physical welfare equipment and, in particular, of public continuation schools. Cincinnati, New York, Boston, Fitchburg and other Massachusetts towns have such schools and plans are afoot to establish one in New York under the garment trades protocol.

A display of copper ware, glass mosaics and engravings was made by a school which trains cripples for self-support. It bore this legend: "We take men from the industrial scrap heap and return them to the ranks of productive labor."

COMMISSION ON SOUTHERN RACE QUESTIONS

THE UNIVERSITY COMMISSION on Southern Race Questions is proving a source of encouragement to the thoughtful people of the South, who are trying to study the race question, especially as it affects their section of the country, in a spirit of fairness and scientific investigation. The commission was organized by James H. Dillard, president of the Jeanes Fund, director of the Slater Fund and formerly dean of Tulane University.

The greeting of President Edwin A. Alderman of the University of Virginia, to the members of the commission at their recent meeting, expresses eloquently the attitude of the commission:

"The so-called race question, which means the right adjustment of relations between the white man and the colored man in American life, still remains perhaps our most complex and momentous public question. On the whole, no man can deny that this complex problem has been handled for the past 30 years with a great deal of instinctive wisdom by the people of the South, and the result of their constructive thought has been acquiesced in by the people of the North with remarkable and commendable faith and confidence. The problem, however, is not settled, and probably never will be, but may be counted upon to present difficult phases to every generation. Indeed, a certain paralysis of feeling about the whole matter, due to exhaustion, I am inclined to think, seems to have overtaken both sections, and those who are seeking to think quietly about the matter should be grateful for the fact that the Negro has somehow gotten on the southerner's nerves and out of the northerner's imagination.

"Both sections have turned with unity of effort to bring about a change in the spirit and machinery of our democracy, whereby they believe the interests of all the people can best be advanced. It is wise that in this breathing spell, patient, wise, scientific, just men should labor at the problem and seek to place it where it belongs among the great economic and sociological questions of the time."

Students at the University of Virginia have taken a prominent part in seriously studying race conditions. Following the conference of the university commission, the race study groups, under the leadership of D. Hiden Ramsey, who holds the Phelps-Stokes fellowship, have gone at their work with renewed vigor. Many students are carrying on first-hand investigations into local conditions. The results of these investigations will be embodied in reports which will be presented at a general meeting held at the close of the academic session.

The university commission has divided itself into five committees for study and investigation. This work will be carried

on systematically this year and reports will be made at the fourth conference to be held in Washington next December. The commission consists of one representative from each of eleven southern state universities. The advisory committee is composed of President Alderman, Dr. Dillard, Chancellor Barrow, of the University of Georgia, and President S. C. Mitchell of the Medical College of Virginia.

DELEGATES TO LONDON CONFERENCE ON THE BLIND

AT THE LONDON CONFERENCE on the Blind to be held June 18-24, America will be represented by Supt. and Mrs. O. H. Burritt of the Pennsylvania Institution for the Blind at Overbrook, Mr. and Mrs. Philip E. Layton, founders of the Montreal Association for the Blind, Miss Cottingham of the Cleveland Society for the Blind, Winifred Holt of the New York Association for the Blind, and Mr. and Mrs. Charles F. F. Campbell of the Ohio Commission for the Blind.

Mr. Layton, Miss Holt, Mr. Burritt and Mr. Campbell are to present papers, the two latter combining on a report on Recent Tendencies in Work for the Blind in America, including an elaborate set of lantern slides. The slides show the new institutions for the blind at Overbrook, Pa., Baltimore and Boston and cover other new work since 1900.

These slides were shown by Mr. Campbell at the meeting at Washington in April of those interested in preventing blindness and aiding the adult blind. Delegates were present from states as widely separated as Texas and Maine, Wisconsin and Georgia. Besides the papers read, there was an unusual amount of round table discussion which proved of very practical interest.

Senator Gore spoke and one of the most interesting addresses was by Dr. C. F. Fraser who has been in charge of the Nova Scotia School for the Blind at Halifax for forty-one years. Last spring Dr. Fraser was called to the bar of Nova Scotia to receive public recognition of his work in that province, the first time in seventy-five years that anyone has been so recognized in Nova Scotia.

KENTUCKY'S PROGRESSIVE NEW CHILD LABOR LAW

AFTER A CAMPAIGN conducted by the Kentucky Child Labor Association and the National Child Labor Committee, through its special agent Herschel H. Jones, the Kentucky Legislature has passed a child labor law which contains practically all the provisions of the uniform child labor law. It includes the eight-hour day, the sixteen-year age limit for dangerous occupations including mines, and the twenty-one-year limit for night messengers.

A BOY AND HIS PETS

The sixty-fifth annual report of the Worcester Children's Friend Society, from which this picture is taken, emphasizes the financial difficulty of carrying on child-placing work.

"In the old days, when twenty-five or thirty children were supported in the 'orphans' home,' it was easy for people to see the need of money and easy to see how and where it was expended.

"Nowadays when one hundred or more children are supported in country homes scattered throughout Worcester county, with the same advantages and under the same social conditions as the children of the communities in which they are placed, the public does not see them and forgets that they must be fed and clothed, guided and supervised, until such time as they may safely return to their families or be put in the way of caring for themselves."

In one provision of the law Kentucky is unique. She has realized what no other state has yet done,—the advisability of prohibiting street work to boys under fourteen. Other states have a ten- or a twelve-year limit, but Kentucky is the first state to establish a fourteen-year limit for all such work.

The law also provides an eighteen-year limit for girls in street work, a standard which has been reached by only two other states, Massachusetts and Wisconsin. Whether this street work provision becomes an actual fact, or simply remains unused upon the statute books, depends largely upon the school attendance officers. They, as well as the labor inspectors and police officers, are charged with its enforcement; but other duties of the inspectors and the police officers are so numerous that the street work provisions may remain unenforced unless the attendance officers fully realize the importance of the law.

There is a good opportunity for the people of Kentucky to help in the enforcement of this provision. The street trader comes continually under their observation, and if they are careful to re-

port to the proper authority all the violations they see, they will greatly aid the attendance officers in their task.

FIRST CHAIR OF VOCATIONAL GUIDANCE

A SPECIAL professorship in vocational guidance, the first in this country, has just been established by Boston University. Meyer Bloomfield has accepted the chair. Mr. Bloomfield will not leave the Vocation Bureau of Boston, of which he is director.

The course for the year 1914-1915 will deal with the theory and practice of vocational guidance. The objects are described as follows: to provide instruction and practical training in the duties of vocational counselors in schools, philanthropic agencies, and business establishments; to afford opportunity for the study, under direction, of vocational problems in education and educational problems in employment; to open the way for contributions, based on reading, research, and service, toward more socially effective material and processes in education and employment; to enable school departments to undertake tentative experiments in vocational guidance.

TIME EXPOSURES *by* HINE

CANS AND KIDS

IS THE STREET BIG ENOUGH FOR BOTH ALL DAY?

A MEMORIAL LIBRARY THE CENTER FOR REJUVEN- ATING A COUNTRY TOWN

BECAUSE OF THE lack of resident initiative and leadership, the village of X—for many years had failed to make any real progress. Similar conditions prevail in hundreds of other communities in our country. The village is calling for leadership and many of our young men who have the vision and the personality and who are looking about for the best way to invest their lives might well consider the small town as a field of service.

That this can be done is shown by the Memorial Library in the village of X—. The library was the gift of a prominent man and his wife who saw the need and gave the building to be used as a social center for the community. The work was started a little over five years ago.

The Memorial Library includes a well-lighted and ventilated auditorium accommodating about 200 people. Here entertainments, fairs and socials are held. Classes in physical culture for both boys and girls are conducted during the winter months. On two evenings a week the people are entertained with the best motion pictures. This keeps in their home community the young people who had been in the habit of going to neighboring towns for these pleasures. A room containing a billiard table and other games attracts the young men and serves to keep them from places that

are of morally destructive character.

A room with showers and a bathtub was added to the equipment about two years ago and is used by the women and girls on specified days as well as by the men and boys. A manual training shop forms a part of the equipment of the Memorial Library. Boys from twelve to sixteen years of age have been instructed in making all sorts of useful articles of furniture.

A domestic science room with every facility for efficient and systematic work in sewing and cooking is included. The girls thoroughly enjoy the work and carry the training into their homes. One year the girls conducted a fair and from the sale of articles realized a considerable sum which they used to pay their instructor in physical work. At a community banquet, the first of its kind ever held in the village, the catering was done by the girls in the domestic science class.

For several years the domestic science and the manual training work has been part of the school curriculum. By being under the direction of the school the work is carried on to better advantage as every child of eligible age is obliged to attend the classes. The wife of the secretary of the Memorial Library has general supervision over the girls' work and most of the classes are under her instruction.

The children are being educated to thrift and economy by a savings system which has been introduced. For several years a number of the village boys have attended a county camp and have been influenced for good through the comradeship and the influence of the other boys. One summer a camp for girls was conducted.

During the past summer a ten-acre lot within a quarter of a mile of the village was rented and used for a playground. The playground contained a baseball diamond and a basketball and tennis court. A cottage was built on the grounds and the secretary and his family lived here all summer, giving personal supervision to the work at all times.

In the first year of the work a village improvement committee was organized. This was appointed from the representative men of the village and residents of the surrounding estates who gladly responded when approached for financial assistance. The first thing the committee decided upon was to light the streets with electricity. It was thought that the taxpayers would not assume this expense until they had seen the great improvement the lights would make in the streets. The committee had the lights installed and for two years met the expense through public subscription. The amount they were obliged to raise was \$1,500. The third year a lighting district was established and practically every taxpayer signed the petition to have the lights paid for through taxation.

One of the greatest needs of the village was a water supply. For five years the committee tried to solve this problem and recently its labors have been rewarded. A company supplying water to a village three miles distant has been induced to extend its mains to the village of X—. A fire company is to be organized with its home in the Memorial Library.

One of the churches had been struggling for years with a debt. At a meeting called to discuss the finances of the church the secretary of the Memorial Library offered to co-operate in a canvass to pay off the entire indebtedness. He outlined a tentative plan and was asked to "go ahead." A large paper elephant blocked off to represent various amounts, the aggregate representing the church debt, was placed in one of the stores. Everybody was enlisted to help and two days before the time appointed for the canvass to close the entire sum had been raised. Everybody gave to "kill the elephant."

These are the more spectacular achievements due to the influences emanating from the Memorial Library; but in point of fact, the whole community has caught the spirit of progress. Do such results merit the investment of a life in a small town?

EAST SIDE STREET TYPES IN COLOR AND CLAY—BY MARY L. CHAMBERLAIN

AN EXHIBITION of paintings, etchings and sculpture has brightened the club rooms of the University Settlement, New York city, the past few weeks. The three exhibitors, all under twenty-five years of age, are members of the settlement. They have spent most of their lives on the crowded, noisy East Side and in clay and in paint they have recorded many familiar figures of the swarming streets—the rabbi, the sweatshop toiler, the blind beggar, the organ woman.

William Auerbach-Levy is by no means an obscure "garret painter." As an etcher he is well known in New York and in Chicago where his *Man with the Cloak* was winner of the first prize of the Chicago Society of Etchers in 1914.

Even as a little chap he was not satisfied with shooting craps and following the gang. He wanted to draw, and so with a group of older lads he formed a life class where each member took turns at being model. Later his talent was discovered by a sympathetic teacher who took him to the National Academy of Design and asked that he be enrolled as a pupil in a night class. In 1911 he won the Mooney traveling scholarship from the academy and, his ambition realized, he was off to Paris to study.

Mr. Levy's etchings are a rare combination of soft delicate line and bold decorative composition. Until four years ago he had not touched a paint

brush and he is still a bit timid in handling paint. His color, however, is always mellow and harmonious, and every canvas betrays a remarkable sense of texture.

Abbo Ostrowsky is not a finished, skilful artist like his fellow exhibitor.

lieved by studies of American and Russian landscape, but always the color is somber and the scene desolate. There is a big gruesome canvas of a Russian graveyard; another, depressingly grey, of New York from the harbor; and many little pictures of deserted country. Even the sunniest, a little sketch called Noon with green marshy background and quiet blue water, leaves an impression of solitude and loneliness.

sion of solitude and loneliness.

Mr. Ostrowsky was formerly a student at the Royal Art Academy at Odessa. He is continuing his studies at the National Academy of Design in New York and is using a room of the University Settlement for his studio.

The youngest exhibitor, Pauline Margulies, has been literally brought up in the settlement. She played games in the settlement kindergarten, she was a loyal member of a girls' club and she learned to model in the settlement modelling class. From this class she graduated to Cooper Union and later she won several medals and a scholarship at the Art Students' League. She has also been a pupil of Abastenia St. Leger Eberle.

Miss Margulies' work most of all reflects the busy neighborhood where she has spent her life and which she knows

so well. The stooping Sweatshop Worker passes daily in front of her home on Delancey street, The Newsboy sells the Jewish *Vorwarts* on the corner, and The Laborer and Family are found in every block—in these familiar figures she finds inspiration for her work.

The Rabbi, by William Auerbach-Levy

But his very lack of tutelage has prevented imitation and encouraged self-expression—a self-expression that reveals the melancholy temperament of the Jewish people. Driven with his family from Russia six years ago, young Ostrowsky has painted dark memories of the field of massacre. These are re-

INDUSTRY

“TRAPPER” BOYS AMONG THE DEAD IN WEST VIRGINIA MINE—BY EDWARD N. CLOPPER

ON TUESDAY afternoon, April 28, another heavy toll of life was taken in the mining region of West Virginia. At Eccles, a little village nestling in the hills not far from the southern border of the state, 180 lives were suddenly snuffed out by an explosion in a coal mine, hundreds of feet below the surface of the ground. All the dead were employes of the New River Collieries Company except one, an insurance agent of Charleston, who had gone down just before the accident occurred, to solicit business from the men.

Intensifying the tragic features inseparably associated with such a disaster was the presence in the mine of several young “trapper” boys who lost their lives with the others. The youngest were only fourteen years of age and of these there were five according to the affidavits of their parents obtained by the company when they were engaged. The law of West Virginia permits fourteen-year-old boys to work in mines and demands no proof of age, “except in case of doubt” when a parent’s affidavit fulfills all requirements. Surely the untimely end of these children should be sufficient argument for the establishment in this state of the sixteen-year age limit for employment in this exceedingly hazardous occupation, especially as coal mining is the chief industry there. Many other mining states have already set this standard.

Two horizontal seams of coal are worked in this mine. One at a depth of 250 feet is reached by shaft No. 6; the other, 500 feet below the surface, is operated by means of shaft No. 5. The two shafts are connected underground, thus affording ventilation by the fan system, one serving as intake, the other as exhaust for the air current. The explosion was in the lower level, near shaft No. 5, where most of the men were at work. At the time there were in these workings 171 employes and the insurance agent, all of whom were killed. In shaft No. 6, at work in the upper level, were 75 employes, of whom 67 were by prompt action taken out alive, and only three of these were injured. Eight men who were close to this shaft lost their lives, although at a long distance from the place of the explosion.

In striking contrast with the disaster six years ago at Monongah, W. Va., no appeal to charity will be necessary, nor will there be any physical suffering on the part of the bereaved families. The new workmen’s compensation law of West Virginia, which took effect last October, makes provision for the care

Completely overshadowed by two wars, one in Mexico and the other in Colorado, the death of the 180 coal miners in West Virginia who were blown into eternity a fortnight back has passed almost unnoticed. It now develops, as shown by Mr. Clopper, who is an agent of the National Child Labor Committee, that five young boys were among the killed. The sending of children into coal mines has been stopped in many states. In West Virginia it is still legal for boys over fourteen to be so employed. It ought to be evident by this time that it is a practice not dissimilar from sending them to stand in the front line of battle.—ED.

of the dependents. To each widow the state will pay \$20 monthly until death or remarriage, and \$5 additional for each child under fifteen years, not to exceed three children in each family. A father, mother or other person who had been dependent on the earnings of a workman under twenty-one years of age, will receive 50 per cent of his average weekly wages for the period that would have elapsed before he reached his majority. The state also pays the funeral expenses not to exceed \$75, and \$150 is allowed to the injured for hospital treatment. Two car-loads of coffins and boxes were furnished at once by the state. The fund out of which these moneys are paid is created by the

monthly payment into the treasury of one dollar for every one hundred on the payroll of each employer, 90 per cent of the amount being contributed by the employers and 10 per cent by the employes. This applies to all lines of industry in the state except agricultural and domestic work. It also includes intra-state railroad service.

Officers of the State Public Service Commission, which administers this fund, were on the scene promptly receiving the claims of relatives of the deceased. The company also stands ready to relieve distress. The mine is one of the properties of the Guggenheim interests; President Guiterman of the company and Charles P. Neill, who is in charge of its labor welfare work, went to Eccles immediately to direct operations and look after the stricken families.

Of the victims of the explosion, 52 per cent were Americans, a few less than half of these being Negroes; 13 per cent were Italians; 11 per cent Polish; 7 per cent Lithuanians; the others were Russians, English, Hungarians and Germans. So far as is known at present, about half of the men were married; but some of those recorded as single may have families in Europe and it will be some time before the exact number of beneficiaries is learned.

The actual cause of the disaster has not yet been ascertained and may never be known. Scientists and officers of both the federal and state bureaus of mines hurried to the spot prepared to give aid and make a careful investigation, but the inquiry awaits the removal of the bodies, only half of which have been recovered at this writing.

The mutilated condition of many of the bodies attests the fearful force of the explosion. Identification has been possible only by means of the numbers on the brass checks given to the men as they went into the mine. In all probability most of the men met death instantly, while others who were found with handkerchiefs tied over their nostrils must have succumbed within a few minutes.

The badly wrecked condition of shaft No. 5 seriously impeded the work of recovery. Timbers, mine cars, and masses of coal and slate were hurled against the shaft by the explosion, blocking the passage and preventing ingress and ventilation. The subsequent accumulation of gas and water further complicated the situation and held the workmen back. The helmet corps of the federal government penetrated into the workings as soon as possible in the hope that some of the miners might be rescued but no signs of life could be found.

GOVERNOR HATFIELD OF WEST VIRGINIA
In the garb he donned to investigate the mine explosion.

DIRECTING THE WORK LIFE OF ENGLISH CHILDREN —BY OLGA S. HALSEY

"USELESS AT TWENTY-FIVE" is the menacing prospect which faces boys who leave school at fourteen to enter blind-alley and unskilled occupations. In London, 61 per cent of the boys leaving school in 1907-1908 entered unskilled occupations which could absorb but a small proportion of these boys when they attained manhood. In the Lancashire cotton mills three-fourths of the piecers fail to become spinners, and must eventually change their occupations. Only one in ten of the tiny "half-timers," who divide their days between school and factory, will ever become a spinner.

The dangers of casual employment or of unemployment threaten all these boys and increase their costliness to the state. It is rare for a boy to pass through less than six places between 14 and 21 years; common to pass through twelve; and occasionally a boy has had twenty or thirty jobs. The demoralization that results from the nature of the work and the constant shifting is of sufficient magnitude to appear in criminal and in Poor Law statistics.

In 1906 in Glasgow, out of 1,454 youths fourteen to twenty-one years old, charged with theft and dishonesty, 87 per cent were from such non-educational occupations as messengers, street trades, and "van boys."

The Poor Law returns for the whole of England for 1907 show that 30.2 per cent of the applicants to distress committees were under thirty years. Majority and Minority Reports of the Poor Law Commission both agree that "the casual market has been increasingly recruited of late years from boys, barely adolescent, who have been cast off by the blind alley occupations which they enter upon leaving school."

The increasing demand for cheap labor in processes which do not require the strength and intelligence of a man has until recently been unhampered in obtaining a ready supply of juveniles. It has even been aggravated by haphazard methods of "picking up a job," and by ignorance on the part of boys and parents of the importance of industrial training and of trades that offer opportunities for advancement.

The juvenile labor exchanges in England have not been established to provide an accessible market for child labor. The immediate purpose is to stimulate intelligent selection of employment and to assist boys and girls leaving school to secure positions for which they are most suited. At the same time the juvenile exchange aims to encourage school attendance and an appreciation of vocational training.

Authority to establish juvenile exchanges in England rests on two legislative acts. By an act of 1909 permission was given to create juvenile exchanges in connection with the National Labour Exchanges conducted throughout England by the Board of Trade. The next year, 1910, the choice of employment act gave local educational authorities power to undertake similar

In THE SURVEY of March 28, Katharine Coman described Great Britain's remarkable system of labor exchanges and the part they play in the system of national unemployment insurance, which went into effect a year ago.

In this article Miss Halsey shows how the labor exchanges are doing service in another direction, that of diverting juvenile labor from the blind alley industries, and directing them into channels that lead to advancement and positions of security.—E.D.

work. Although at first this duplication of effort caused some confusion, a satisfactory division of work has gradually been effected in the majority of exchanges.

In general, the actual placing of the children is done through the Board of Trade Exchanges, since they are conversant with the labor market throughout the country and since they are the natural medium to which an employer turns for labor. On the other hand, the more personal side of the work—such as guiding and advising applicants and superintending "after care"—is done by the educational authorities.

Birmingham and Edinburgh, in common with sixty other towns, have made arrangements under the choice of employment act, whereby volunteer committees of the local education authorities supervise the boys and girls for whom the exchanges have found situations. In London volunteer members of the juvenile advisory committees of the Board of Trade meet *in rota* to advise girls and boys about their future work and the exchange officer is expected to carry out their recommendations. The personal "after care" is again left to the "care committees" of the schools.

In placing children in positions for which they are best suited, the officer of the exchange is assisted by the "school leaving form" filled in by the teacher and others who have known the child. This places at his disposal knowledge of each child's scholastic attainments, special aptitudes, health, home conditions, and preferences of parent and child in regard to employment. A note is also made as to whether the child will need after care.

In Birmingham, in 1913, 17.6 per cent of the children were recorded as needing special after care; 36.9 per cent moderate care; and 38.1 per cent none, except for encouraging further education. In London, about 40 per cent are recorded as needing no further supervision. During the year, officers of the exchanges speak to the children, and parents' meetings are arranged so that both parent and child may be impressed with the necessity of learning a trade, and the desirability of applying at the exchange. In Birmingham, for example, in the second year of the exchange, 23

parents' meetings were held, with an average attendance of 140. As a result of such efforts about 50 per cent of the London children apply at the exchange, often accompanied by the mother, and talk over the prospects of the future.

It is a difficult task to match the desires of the children and the work for which they are most fitted with the available vacancies. In contrast to finding employment through newspapers, signs or hearsay, the brightest lads are given the positions with the best promise of advance. As far as family circumstances permit, they are advised to start with low wages, and learn a trade, in preference to high wages with no future prospects.

In Birmingham the better class of girl is urged to go into the skilled trade of making jewelry. The skilled but coarser work of lacquering, French polishing, and upholstery is recommended to the rougher class of girl. With all, every effort is made to place boys and girls in factories with a good "tone," and to steer them from blind alley and overcrowded occupations.

When a decision has been reached, the child is sent with a card of introduction to the employer with a vacancy. The employer is free to accept or reject the applicant, and to make his offer of terms. The child then reports to the exchange, whether or not he has secured the job, and what wages he is to receive.

In Birmingham 6,457 vacancies were filled, out of 9,803 notified at the juvenile exchange for the year ending October 31, 1913. About 32 per cent of these were filled by boys and girls direct from school. The largest number of boys placed, 1,188 or 32 per cent of the total 3,663 boys, was in the various branches of engineering; the largest number of girls, 507 or 18 per cent of the 2,794 girl applicants, was sent to warehouses. Only 1.5 per cent of the boys become "van" boys, i.e. drivers, trucksters, etc. These figures may well be compared with returns giving situations of 351 boys who had placed themselves without the aid of the exchange. One-fifth of these boys went into the less favorable occupations of errand boys, tube drawers, van boys, and beer bottling.

It must be remembered that Birmingham is exceptionally rich in the number of its skilled industries, so that the exchanges have every opportunity to divert boys and girls from the least promising into the more promising trades. Seventy-five per cent of Birmingham employers make use of the exchange and ten of the largest firms obtain all their juvenile workers through this channel. Co-operation on the part of employers enabled the exchanges to place in a single month 39.4 per cent of the children who had left school in that period.

In placing the best boys and girls in the best openings, a central office acting as a clearing-house for each local exchange is essential in the large cities. In London, for example, the East End, a district with a big working class pop-

ulation, offers few really promising openings. Through the central office of the Labor Exchange capable boys and girls of the East End are sent to better positions in the West End.

During three months, ending in October, 1913, one particularly fortunate exchange placed 536 children locally, and 499 in other districts. Although workers in the London exchange complain of a lack of suitable openings, returns showing the distribution of vacancies filled by seventeen juvenile exchanges in London are regarded as satisfactory, in comparison with a former return which disclosed the fact that not more than one-third of boys leaving school found advantageous openings on their own initiative.

In these returns from seventeen exchanges the vacancies are graded A, B, C, according to their promise of absorption into the industry. In general the possession of a school leaving form implies that the child has just left school.

TOTAL VACANCIES FILLED (BOYS AND GIRLS) BY 17 JUVENILE EXCHANGES IN LONDON

Without school leaving form	
A vacancies.....	1641
B ".....	2562
C ".....	1156
	5359
TOTAL	8743

The high number of "A vacancies" and the small proportion of "C vacancies" filled by applicants direct from school speaks well of the preventive work.

Throughout the length and breadth of England exchanges are carrying on similar work. In 1913, 90,387 vacancies were filled by boys, and 65,921 by girls. Deducting those placed more than once, 74,535 boys, and 54,206 girls were placed. Twenty-four per cent of the openings for boys, and 30 per cent of those for girls were filled by children who had just left school.

The juvenile exchanges are constantly attempting to increase the possibilities of advancement in the different trades. To a certain extent they have succeeded in inducing employers to regard the youthful applicant as an individual who will need a man's wage, when he reaches manhood, and to reorganize their plant accordingly. In one instance, an East End firm formerly discharged its boys of seventeen, and recruited its staff of buyers and salesmen from outside. Through the efforts of the exchange, the work has been rearranged so that the boys are in line for promotion to this high grade of work.

The London County Council now allows time off to its boy employees, to attend continuation school. The post office, which formerly dismissed half its boys sixteen and seventeen years old, is now offering a permanent career to promising youths. In Birmingham the effect has been to improve the number and quality of applicants, so that

an insufficient supply of labor has been replaced by a waiting list.

The work of the volunteer in taking a friendly interest in these boys and girls is a most important adjunct to the scheme. In Birmingham the work is organized by the education committee, which has formed seventy care committees with a membership of 1,586 helpers for the 130 schools. The second annual report of the central care committee of Birmingham, describes the infinite variety of duties that devolve on the volunteer visitor.

"Visits to the homes, interviews with parents and children, industrial information given, questions answered, warning imparted, sense of responsibility reawakened or strengthened, educational guidance, matters of health discussed, character influence, individuals brought into touch with recreative, social and other organizations,—evidence of all these and more is to be found in the eight thousand odd reports, but these things cannot be set out in tables or served up in statistics."

As 68 per cent of the Birmingham young folks are credited with membership in Boy Scout troops or other organizations, the volunteers aim to secure club leaders who are in contact with the children to eventually assume the after care work.

In London school care committees were organized originally to care for necessitous children who required school feeding or medical treatment. The additional work of after care for the labor exchanges is often a burden and inadequately done. Some people believe a serious defect in the scheme is the responsibility that rests upon a corps of volunteer workers who may not be fully trained to meet the responsibility that the work demands. Those in charge of the work, however, feel that a large body of volunteers in preference to paid workers is essential to the success of the plan.

At present the complaint is made that only about half the school children who ought to come to the exchange apply. Undoubtedly the usefulness of the exchange would be increased by compulsory registration for all school children. The present organization of exchanges in England does not prevent this and may be preparatory to this further development.

Coupled with this demand, many people urge that instead of the present arrangement of including boys and girls up to seventeen years of age, guidance is needed until the period of shifting from blind alley work to permanent work is ended at eighteen years.

These two reforms would give the exchanges effectual control over children for four years after leaving school and would gradually eliminate half-grown boys who have never had a good start since leaving school and who are habitually out of work. In this connection it is interesting to note that one exchange has actually started a school which unemployed youths may attend, and that the general effect of the exchanges is to shorten the period of demoralizing unemployment.

Critics of the juvenile labor exchange

urge that no permanent improvement in industrial skill can be attained until on the one hand the school-leaving age is raised and a system of compulsory half-time schools introduced, and on the other hand until business is so reorganized that there are suitable openings with reasonable hours of work. Such critics remember only the commercial function of the exchange and overlook its broad educational value to the child, the parent, the employer and the public.

As the result of the effort of volunteers in urging children to continue their education there has been an increased attendance at the continuation schools in Birmingham, Edinburgh and Huddersfield. The committees are uniformly impressed, however, with the difficulty of attending evening classes when the hours of employment are frequently so long as to leave the boy tired and unfit for further exertion. The constant attention of large numbers of volunteer workers to the evil of overworking children and the collection of information upon child labor are the surest preparation to laws for a shorter working day and an older working age.

The fact that it is difficult to keep children in any one situation for any length of time and that the exchanges are filled with inefficient boys and girls has focussed public attention on the educational and industrial systems which have produced this kind of prospective wage-earners.

Finally, aside from its success in placing promising youths in better openings and its probable reduction of adult unemployment, the juvenile labor exchange must be tested by its influence upon the parent and home. At the present time parents welcome this new guidance. According to J. W. Peck of the famous Edinburgh exchange, "Even the most careless parents are constrained . . . to devote a certain amount of consideration to the future career of the children. . . . The community is bound in the long run to reap benefit from the consequent awakening of this sense of responsibility."

DRINK AND WORK ACCIDENTS

"Workmen frequenting drinking places coming to or going from their work will be replaced by non-drinking men as rapidly as possible."

This notice, posted in the American Car and Foundry Company's plant at Berwick, Pa., has resulted in a marked decrease in accidents among the 5,000 men employed there. It was put up following the visit to Berwick of the Rev. Henry W. Stough, who conducted a vigorous crusade against the drink evil.

The meetings by Dr. Stough were held the end of October and the beginning of November. Since that time, it is asserted, accidents have been reduced 34 per cent. The output in the passenger car department has been increased from one and one-half cars a day to two cars, with the same force employed. The bank deposits in the six weeks following the meetings were \$80,000 larger than in any other six weeks' period.

It is reported that the judges in Berwick will refuse to grant any licenses in the town next year.

TEACHING CITIZENSHIP TO BOYS OF FIFTEEN NATIONALITIES—BY JAY O. WARNER

CHAPLAIN, HILO BOARDING SCHOOL FOR BOYS

WHEN IN 1820 the American missionaries first landed on the sunny shores of Kailua it was with instructions from the home board that they were "to aim at nothing short of covering the Sandwich Islands with fruitful fields and pleasant dwellings, and schools and churches, and of raising the whole people to an elevated state of Christian civilization." Accordingly the early fathers set about this high commission with characteristic New England zeal. These wise men from the east knew that any change in the heathen heart that might be affected by their efforts would avail little without a corresponding development of the head. Schools were imperative, but what kind of schools? Theory had little place in those days and experience was to solve this with many other subsequent problems.

Perhaps the greatest impulse to learning in the early days was given in 1824 when Queen Kaahumanu was induced to leave off card playing to study the art of "book-talking." Old and young followed her example and took up the popular fad; before the end of the year two thousand persons had learned to read and write. But the sagacious missionary fathers saw deeper than this. Education as a mere accomplishment could have little redemptive value with a people naturally indolent. Besides, school buildings and churches were necessary and where could capable builders be found? There was but one answer—*teach the natives to work*. The earliest attempt at manual training was in 1831, when native students erected a school building under the direction of their teacher on

the island of Maui. Lahainaluna Seminary, as this school was named, flourishes to this day, retaining its department of manual training.

After this first experiment in industrial education the missionaries began developing the idea in other places. The oldest and in certain respects the most remarkable of the island vocational schools was founded at Hilo, island of Hawaii, in 1836. This school, hereafter known as Hilo Boarding School for Boys, began operations in a lowly thatched grass house with Rev. David B. Lyman and his good wife as teachers. It is their grandson, Levi C. Lyman, who is the present principal. Starting with eight pupils the number soon swelled to sixty-five native Hawaiians. By heroic means more commodious buildings were then provided and a program adapted to the needs of the applicants was laid down.

By this it is seen that industrial education in Hawaii antedates that of the mainland; or, in other words, the method of "learning by doing" is hardly more modern than the first quarter of the nineteenth century. The genius of David Lyman, founder of Hilo Boarding School, is apparent not only in the local success of the enterprise, but in its far-reaching influence. He was inaugurating a system of instruction, however simple at first, far in advance of the educational world of this day.

It was not until 1878, forty-two years after David Lyman had begun elementary tool instruction in Hilo Boarding School, that the first of a long series of manual training schools

was inaugurated at Boston. It was a well-deserved tribute paid to a notable educator when General S. C. Armstrong said, that when he wished to make Hampton the best kind of school for the freedmen he took Father Lyman's Hilo school for a pattern."

Since it is not the purpose of this sketch to trace the seventy-eight romantic years comprising the history of Hilo Boarding School, mention must be made of certain historical influences which were determining factors in the present character of the school. The work was done for the express benefit of the native Hawaiian. By 1840 the school had advanced sufficiently to promulgate the new rule: "No boy can leave his sleeping apartment without pantaloons." Up to this time the boys had been allowed to work in their native dress with a shirt as the foreign addition.

About this time also the missionaries prevailed upon the government to establish a public school system throughout the kingdom and the Rev. Richard Armstrong, father of the general, was appointed minister of public instruction. Mr. Armstrong secured a grant of forty acres of fertile land and this with a small herd of cattle became at once the chief endowment of the institution. In 1850 the missionary board withdrew its support, the financial burden resting largely upon the trustees, while the *sine qua non* of the students was hand labor.

In the thirty-eight years of Mr. Lyman's principalship 870 boys were enrolled upon the school register. During this time more than 200 graduates entered Lahainaluna Seminary. Over 400 became school teachers and 30 became ministers in these islands or missionaries to the Marquesian or Micronesian Islands. About 1850, a change in population of the Hawaiian islands, occasioned by the rise of the sugar industry and a consequent importation of foreign laborers, wrought a corresponding adaptation of Hilo Boarding School to the new conditions. In a few years the children of the *kamaainas* (newcomers) began to apply for admission, and the school was morally obliged to open its doors to them. Today, no fewer than fifteen nationalities are represented by the boys, most of whom are native-born American citizens.

More than half the entire island population are Orientals at the present time, but immigrants are coming from Europe and elsewhere in increasing numbers. Meanwhile the native Hawaiian has been rapidly disappearing, partly through a high death-rate, but mostly through miscegenation. The social composition a half-century ago was simple and homogeneous; today it is quite complex. The opening of the Panama

BOYS AT WORK IN THE GARDENS AT HILO BOARDING SCHOOL

More than half the supplies for the dining hall are produced by the farm and dairy.

Canal, according to social prophets, will have a tendency to heighten the complexity.

Add to this the tendency of the children of the plantation laborers away from the peonage in which they see their parents living, and the function of vocational schools in the community becomes apparent. The public schools in Hawaii are only beginning industrial training now, while Hilo Boarding School, after three-quarters of a century of service, finds shop and class-room overcrowded and its equipment inadequate to meet the demand. If Hawaii is to support any considerable number of homemakers, that is, if the rising generation is to become a community of independent citizens instead of a horde of serfs, the training offered by such a school is of incalculable value.

The courses of study followed in this school, in general features, are identical with those of industrial schools elsewhere. The training offered, while encouraging advanced study in special cases, aims to provide a well-rounded and fairly complete course for those who cannot for any reason continue their education in higher institutions. The forenoons from 9 to 12 are devoted to the class-room; the afternoons to farm work, shops and athletics; evenings to study.

The agricultural work is both practical and experimental. For years these boy farmers were the acting custodians of Uncle Sam's Agricultural Experiment Station in Hawaii. That has finally reached such proportions as to justify a separate establishment under the direct control of the government. The principal crop is taro (*Caladium colocasia*) cooked tuber into a mash with a shaped stone, mix the mash with water and allow his staff of life "poi." The native method of making "poi" is to pound the well- from which the Hawaiian manufactures

it to ferment. It is amusing to observe the astonishment of the native parents who visit the school on seeing the rapidity with which their sturdy sons "pound poi" by motor power. So important is this food item in the Hawaiian pabulum that the natives are sometimes styled the "poi polloi" of the islands. But "poi" fame is extending far beyond Hawaii, for small quantities of it are being shipped to Washington by Hilo Boarding School at the instigation of Professor Shepherd of the Geo-physical Laboratory

who is conducting experiments with it for its valuable medicinal and food properties.

Besides taro, many kinds of vegetables and fruit are raised, there being no fewer than twenty-five varieties of bananas alone. A fine herd of Holstein cattle produce butter and milk, and the boy-butchers keep the school table supplied with sweet, fresh meat.

The best known product of the school, however, is the exquisitely polished wood-work wrought out of the beautiful Hawaiian hardwoods. Wood-craft is a fine art here. *Koa*, sometimes termed Hawaiian mahogany, being most handsomely grained, is especially popular and commands a high price.

Without the grant of land by the government and gifts of money and tools from friends, Hilo Boarding School could never have existed, but it is equally true that without the loyal co-operation of the students in the form of hard manual labor, the school could not have been maintained.

The benefits are mutual; the boys' labor on the farm contributes substantially to the upkeep of the school. More than half the supplies for the dining hall are produced by the farm and dairy, while the carpenters, plumbers, blacksmiths, harness-makers and electricians do work in both construction and repair. No boy is turned down because he has no money when he applies for admission. There is no tuition charge. Thirty-five dollars and three hours' daily toil on the farm covers his board expense for a year. For the boys who cannot secure the \$35 in cash, a system of "work-scholarships" is provided which enables them to earn the amount during the school year.

The school offers a course in home training indispensable to the boys who apply. Many of them come from

TARO—HAWAIIAN STAFF OF LIFE

poor homes or worse, and some from no homes at all. In the dining hall, dormitory, shop and class room, good manners are imperative, while the individual rooms of the older boys are models of neatness and purity. One of the most important departments of the school is the home crafts, which aims to instruct the future home-maker in many kinds of repair, culinary and embellishing arts, requisite to well-ordered homes.

Then there is the civic aspect. Here is a school for patriotism. Inter-racial differences must be harmonized in the collective life or individual failure would be certain. The attendance by nationalities is about as follows: Japanese, 35; Hawaiian, 20; mixed, 20; Chinese, 5; Korean, 5; Samoan, 4; Filipino, 2; others, 4.

There is a democratic spirit about this school community greatly needed in this age of class struggle and social unrest. As is well known Hawaii has maintained a feudalistic society for nearly half a century, but the beginning of the end is at hand and a new social order is in sight. The present cosmopolitan population of the islands demands cosmopolitan schools. Hawaii is not only a crucible on Uncle Sam's frontier, it is the melting-pot of opposing civilizations in which all the world is concerned. On this small spot the Japanese learn to labor shoulder to shoulder with Russians, Samoan meets European under the flag of a common freedom. Is not this an important step toward the solution of one of our greatest social problems?

Great responsibility here devolves upon the American people. There are already in Hawaii 5,000 Japanese American-born citizens. They are constitutionally entitled to all the rights of American citizenship—yet at this writing their Hawaiian birth certificates are rejected by the authorities on the Pacific coast, as a result of a recent action of the Department of Immigration. Whatever danger or incongruities may be involved in such a national policy as this, it may help to insure the stability of our island population, and make the inculcation of democracy on our frontier all the more necessary.

The discipline of Hilo Boarding School is military, yet there is much in keeping with popular government. There is a judiciary system which permits every member of this community to have a voice in the maintenance of order. Three judges from the student body are elected by the boys as a school tribunal which meets once a week under the supervision of the principal to try all offenses and mete out penalties. Punishment consists in a restriction of privileges and rarely is a case ever appealed to the faculty.

Lastly comes religion. Hilo Boarding School is a Christian institution. It does not reject the Bible in its curriculum. The Christian faith is not compulsory and there is no effort at coercion beyond the wholesome requirement of church attendance. The school is non-sectarian and aims to be as broadly progressive in its religious life as accords with the best thought and practice of enlightened Christianity.

PROFESSOR DEWEY'S REPORT ON THE FAIRHOPE EXPERIMENT IN ORGANIC EDUCATION

WHEN Marietta L. Johnson came out of the South a year or so ago and won a hearing among northern teachers for the educational experiment which she had been carrying on for six years at Fairhope, Ala., she alone could speak of her work from first-hand knowledge. Even when the Fairhope League was organized in the hope of putting her work on a permanent basis, Mrs. Johnson's word for what she had actually accomplished had to be taken on faith. People listened, believed and were glad, for from a region where illiteracy lies heaviest and the needs of childhood are most marked there had apparently come a gleam of promise.

The first rounded presentation of her work was published in *THE SURVEY* last December, but even then, gave for one or two hasty visits of educators traveling in that region, who could report nothing more definite than favorable impressions, no educational authority from the North had gone to Fairhope to see for himself.

This situation no longer exists. Prof. John Dewey of Columbia University, invited by the Fairhope League to visit Mrs. Johnson's school, has returned "without any doubt as to the school having made good." Professor Dewey's fourteen-year-old son accompanied him.

At the end of their first day Professor Dewey's son reported that all the children he talked to were "crazy about the school" and before the visit ended he begged to be left in Fairhope himself.

In his report to the league Professor Dewey says that before going he had expected that it would be necessary to make allowances because of obstacles against which the school had worked,—the inherent difficulties of any new step as well as the lack of means to secure properly trained teachers. "But while there were, of course, many details susceptible of improvement," he goes on, "I did not find it necessary to make nearly as many allowances as I had anticipated." To quote further:

"In my judgment the school has demonstrated that it is possible for children to lead the same natural lives in school that they lead in homes of the right sort outside of school; to progress bodily, mentally, and morally in school without factitious pressure, rewards, examinations, grades, or promotions; while they acquire sufficient control of the conventional tools of learning and of the study of books—reading, writing, and figuring—to be able to use them independently.

"The demonstration is all the more striking because of the odds against which Mrs. Johnson has labored and because of the simplicity of the means by which the results have been attained. Anybody who went to Fairhope expecting a revelation of wonderful new methods and devices would come away much disappointed. There are no tricks of the trade, no patent devices, no unique nor even peculiar appliances, no methods in one sense of that term.

"If the expression be not misunder-

stood, I would say that what impressed me most on the side of educational procedure was negative; namely, the absence of all special devices calculated to make up for the lack of the various forms of pressure usually brought to bear upon children. What has been done is simply to provide the conditions for wholesome, natural growth in small enough groups for the teacher (as a leader rather than as an instructor) to become acquainted with the weaknesses and powers of each child individually, and then to adapt the work to the individual needs.

"As a demonstration that normal growth and education are really identical, the school is more impressive than if it had had more external appliances and more skilled teachers at its command. In the latter case, the question might have been raised as to how far the desirable results were to be charged to the account of teachers and equipment and methods of instruction better than are found in the ordinary school. This does not mean, of course, that Mrs. Johnson's own personality has not counted for a very great deal—the existing school would have been impossible without such a personality, but at the same time what she has done has been to give her time, energy, devotion, and intelligence to seeing to it that the children had the opportunities of growth undistorted by external pressure."

Freedom in the school, declares Professor Dewey, is treated as a mental and moral matter, not as a matter of whim or caprice. He goes on:

"The school was not only orderly in the intellectual and moral sense—the only standard that ought really to be applied—but displayed a decent external order of the usual kind—save for the greater freedom of physical posture and movement and conversation. Both in Mrs. Johnson's own classes and in the manual training, taught by Mr. Johnson, children were busy, active and interested in their work, and there was no fooling at all."

Professor Dewey urges that Fairhope be kept as the experiment station and that its method be made to "spread and permeate the rural schools of the county and then of adjacent counties." The very simplicity of rural life in the South, he says, makes its education more plastic to radical changes.

As a further means of propagating the ideas and practices of the school he urges the training of local young men and women to carry on similar work in the vicinity, and the preparation of teachers from the North to undertake the work in the North. Mrs. Johnson, says Professor Dewey, should be relieved from constant financial worry. A guarantee fund covering a span of years, he declares, would give her opportunity for supervision; for greater attention to the assisting teachers; for her training work, as well as for trips north to make her work known and to give assistance and supervision to like attempts there.

BOOK REVIEWS

THE WINE PRESS

By Alfred Noyes. F. A. Stokes & Co. 49 pp. Price \$.60; by mail of THE SURVEY \$.65.

War Verse— Peace Propaganda

The Wine Press is a notable contribution to the literature of the peace movement; nobly and passionately conceived, carefully wrought, the poem is indeed literature in a very real sense, and deliberate propaganda as well. No one has set forth the horrors of war with more detailed and cold intensity than Mr. Noyes. The verse drips red and shrieks. By a studied intermission of rhyme and an occasional conscious break in the meter, the poet has achieved a harsh, rushing cadence which almost makes one cover one's ears:—

"The shrapnel severed the leaping limbs
And shrieked above their flight.
They rolled and plunged and writhed
like snakes
In the red hill-brooks and the black-
thorn brakes.
Their mangled bodies tumbled like elves
In a wild Walpurgis night.

"Slaughter! Slaughter! Slaughter!
The cold machines whirled on.
And strange things crawled amongst the
wheat
With entrails dragging round their feet,
And over the foul red shambles
A fearful sunlight shone."

The technician, intellectually detached and savoring aesthetic values, will find much to appreciate in these descriptions of battle; but for the ordinary reader, cradled in the romance and pageantry of war, they will hold no pleasure. Mr. Noyes undoubtedly did not mean that they should. The glittering battalions of earlier romanticists do not cross these pages: instead, we have ignorant peasants herded in trains to battlefields where is "no sight, no sound of an enemy," but on a sudden, "a thunder of shrieking air," red ravin, and after "scarecrows that once were men." We have "villages in panic rout," and the innocent home defiled:—

"The child, the child that lay on her
knees.
Devil nor man may name
The things that Europe must not print,
But only whisper and chuckle and hint,
Lest the soul of Europe rise in thunder
And swords melt in the flame."

But Mr. Noyes is too genuinely the artist to give us unmitigated horror. The relief is afforded by the terza rima

in which is told the idyll of the young Balkan peasant, Johann, and his wife; and by the exalted songs of Michael. After all, it is as a lover of peace that Mr. Noyes describes war, and it is in picturing peace that he is most truly the poet. The difficult terza rima is used with a haunting simplicity which no other English poet has excelled.

*"O, little blue pigeon, sleep. Sleep, Dodi
mine,*

*She murmured.. Sleep little rose in
your rosy bed.*

*The moon is rocking, rocking to rest
in the pine.*

"A great grey cloud sailed slowly over-
head.

She stood behind Johann. Around
his eyes
Her soft hands closed. 'Dodi's asleep,'
she said."

As poetry, the idyll marks the highest point in The Wine Press. Spiritually—though not always poetically—the songs of Michael are at the summit of the poem. They strike the mystical and frankly religious note, without which the cynicism and brutality of the "tale" could not be endured. It would be hard to tell why these verses do not rise as high as they were meant to. Something they lack in music, perhaps; something, perhaps, in passion, or passion's adequate expression. The most moving is the simplest, the one in which Michael sings: "This war is not as other wars—Freedom rides before you

"On the last of the crusades."

Later, when his eyes have been put out, he can still triumph with his resounding hexameters—describing the Face of Christ pictured waiting and watching from the walls of San Sofia, for the coming of His own. He can still say—"Blessed are they that see—The beautiful angel of our Fatherland"—the angel of Liberty walking through the "tattered hospitals." At the end, crucified in the apple tree, he is still dauntless, singing,— "Conquered, we shall conquer!—

"Till, members of one Body,
Our agony shall cease:

Till the souls that sit in darkness
Behold the Prince of Peace."

It is in this same dauntless spirit, the crusading spirit of his Michael, that Mr. Noyes closes his poem:

"An arrow is at the heart of Death,
A God is at the doors of Fate!

It is the Dawn! The Dawn!" . . .

FLORENCE CONVERSE.

HEPBURN OF JAPAN AND HIS WIFE AND HELPMATES

By William Elliot Griffis. The Westminster Press, Philadelphia. 231 pp. Price \$1.50; by mail of THE SURVEY \$1.62.

Medical Crusader at Work in Japan

The transformation of Japan from the "old" to the "new" has been so rapid, so marked, as to seem almost miraculous. To one seeking a real explanation of this wonderful phenomenon, Dr. Griffis' book will prove most interesting and enlightening.

The call, "Go ye into all the world and preach the Gospel to every creature," had long been ringing in the chambers of the soul of Dr. Hepburn, when the Harris treaty in 1859 opened a possible door in Japan. He at once turned his back on the alluring prospect of a continually increasing and lucrative medical practice in a metropolitan city, and on January 6, 1859, wrote a letter to the Presbyterian Board of Foreign Missions offering himself and his wife, who was equally devoted, for work in the new field. On January 12, 1859, his offer was accepted.

This arrangement led the way to a most happy and fruitful period of service in Japan, longer than the average life-time, extending from 1859 to 1892. Their home was set up at Kanagawa across the bay from Yokohama, which was then inhabited only by a few fishermen. One of Dr. Hepburn's first achievements there was instructing the Japanese in the chemistry and the manufacture of soap.

"As soon as possible this crusader, armed with the lancet, attempted to begin medical work. He rented a Buddhist temple, not far from his dwelling, fitted it up, and opened it for the benefit of submerged humanity. Soon it was thronged with sick people of every kind, often from six to eight score a day. Thereupon the government interfered, drove the sick people away, shut the gate, stationed a guard before it and allowed none to enter."

The doctor surmised that this was done to drive the foreigners from Kanagawa to Yokohama where they could be more easily guarded. He continued to visit the sick and administer to their needs, however, never flinching through fear of danger.

In 1863 the Hepburns removed to Yokohama where the doctor "reopened his dispensary and was at work in it every week day, until 1879, ministering to the diseased. . . . He prescribed for from six to ten thousand patients

The Survey, May 16, 1914.

yearly, and had about him a corps of five to ten young Japanese men anxious to learn the healing art. . . . It is no exaggeration to say that for the Japanese born since 1870, he, under God, made theirs a different world to live in. . . . He was always referred to in Japan as 'Kun-shi,' the righteous and noble gentleman."

To a foreigner the mysteries of the Japanese language are appalling. The doctor had to attack this problem without the help of phrase-book, grammar, or dictionary, "but soon had leaped over the wall and was in the strange world of Japanese thought and roaming in the garden of Japanese literature." By dint of consistent and assiduous industry, "he got out the first edition of his great Japanese dictionary, on which all the others are based, as early as 1867." In 1891 he brought out his Bible dictionary in Japanese, a work begun in 1889. February 3, 1888, was made memorable in Japan by a meeting held to celebrate the completion of the translation of the entire Bible into Japanese.

It would be interesting to follow Dr. Griffiths through his recital of the story of the building of the Shiloh Church, and labors in it; of the growth of a small school till it ended in the noble Gakunin University, and of the doctor's election to its presidency and his success in that position. But space will not allow. "In 1892, after thirty-three years of loving service, Dr. Hepburn, the Christ-filled pilgrim, retired from active toil, to spend his remaining days in his native land."

MARSHALL R. GAINES.

CHILD LABOUR IN THE UNITED KINGDOM

By Frederic Keeling. P. S. King and Son, London. 326 pp. Price \$2.00; by mail of THE SURVEY \$2.14.

This is a study of the development and administration of the law relating to the employment of children, prepared in behalf of the British section of the International Association for Labour Legislation. The committee in charge of the study and report consisted

of Lord Henry Bentinck, M.P., Constance Smith, Mary Phillips, Mr. Keeling and Miss Sanger. The report embodies the work of a large number of volunteer investigators and is a model of painstaking editing.

The divisions of greatest interest to American readers deal with street trading and public entertainments. In London the minimum age for the former is now fourteen years, and the government bill which was introduced at the session of 1913 proposed to extend that age limit to all towns in England, Wales and Scotland, and to require street traders to be licensed and to attend a continuation school. From many different starting points, the evidence converges upon the point that "of all forms of blind alley labor, street trading is, without exception, the worst."

In the somber mass of confused and discouraging facts, one bright spot shines forth. The diminution in numbers of children employed in public entertainments is astonishing. According to the officials of the London County Council there are at the present time never more than ten applications in a week for licenses for children under fourteen years old. Usually there are not more than five or six, and at Christmas the number does not exceed 100. Compared with New York this is most cheering progress. Indeed it seems to be excelled only by Massachusetts and Illinois which forbid outright the employment at night of all children below the age of sixteen years.

Charts, schedules, tables, texts of by-laws, indexes and a bibliography afford the student every available aid for understanding a most intricate, difficult and discouraging subject.—the confused and incoherent mass of British legislation concerning child labor.

FLORENCE KELLEY.

IN BLACK AND WHITE

By L. H. Hammond. Fleming H. Revell Co. 244 pp. Price \$1.25; by mail of THE SURVEY \$1.36.

Within recent years the South has produced a number of sympathetic books upon the Negro,—the best known among them being those of the late Edgar Gardner Murphy. In Black and White comes as the latest contribution to this group, and sounds the clearest, most decisive note. Mrs. Hammond is a southerner who has an intimate knowledge of working class conditions, both North and South, and she makes the keynote of her book the assertion that the Negro problem is primarily not a Negro problem at all but a poverty problem, and that the colored people have suffered grave injustice from the failure of the South to understand this fact.

The book deals therefore with poverty among the Negroes and its amelioration,—with health, housing, delinquency, education, civil rights. It speaks in gentle but no uncertain terms of the Negro's helpless position and the injustice he often experiences. Examples are given of refined colored women who have been forced into jim-crow cars and obliged for hours to hear filthy language amid filthy surroundings; of colored boys sent to the chain gang for ten and fifteen years for the commission of petty offenses; and of educated, industrious Negro families forced, because of segregation, to bring up their children on streets where vice is permitted to traffic unrestrained.

The book, however, is a hopeful one since it shows the awakening of social consciousness among thoughtful, educated southerners, and the beginnings of preventive work. Especially touching are the author's anecdotes of the social work of individual, often unlettered,

colored men and women. As an example, she tells of Sam Daily, a Negro of Alabama, who donated himself and his family and one hundred and twenty-five acres of land (which at his death he had not been able to clear of mortgage) to the use of the state. He received during his lifetime 300 boys from the Birmingham juvenile court, fed them, clothed them, and taught them industry, cleanliness and honor, so that ninety-five per cent "made good". Yet the state never gave him money for his services. Her stories make us realize that once given the impetus to social service the South will find a hearty response among her people, of whatever race.

In Black and White is the book of a philanthropist and is oblivious of the political and labor movements of the Southern working class since the war, movements in which the Negro has taken a small part. It is the appeal of *noblesse oblige*; the recognition that advantages are obligations. We believe that it will meet with a warm response among the many thoughtful southerners who desire to meet the race problem in the spirit of humanity; and the Northerner will find it full of interest, and written with a delightful humor that makes it one of the most readable of our sociological books of today.

MARY WHITE OVINGTON.

ROUGHING IT WITH BOYS

By Geo. W. Hinckley. Association Press. 266 pp. Price \$.75; by mail of THE SURVEY \$.82.

In a true sense this book might be called the real diary of a real man. The boys also are real, and the various chapters tell the stories of different groups of boys from the Good Will Home, in Hinckley, Maine, with whom he has tramped and camped in the woods

and along the coast of Maine. The style is that of the diary and the newspaper and reveals the man.

This revelation of a real man living with and not just for his boys gives its chief value to the book. The chapters brighten the eye and fill the lungs and expand the nostrils as the real woods and sea do. There is also advice and experience about simple methods of taking outings. These outdoor experiences are interesting and suggestive, but what the reader must not miss is the sight of the man himself in the midst of his boys. A man with a yellow streak in him cannot stand such intimacy. One does not need more evidence than is given in this little book to learn the real reason for the remarkable success of the Good Will Home.

For example, note the all wool quality of a man who invites one of his huskiest boys out from a winter camp for a walk, with this result: After they were a mile from camp and the man thought no one in the camp could hear a cry for help, he grappled with the boy,

and after a doubtful struggle put him down on his back in the snow and sat on him, with the words: "I came out here so that I could put you down and give your peachy cheeks the biggest rub they have had in many a long day, sonny; take that." And with those words I began to rub his cheeks vigorously with frozen snow." On the way back the boy watched his chance and threw the man down and sat on him with the words: "Do you know what I have got you down here for? 'Twas so I could." And then he gave my face the severest rubbing with that sandy crisp snow that I have ever experienced." No shoddy relationship with boys can go through a washing like that and come out without wrinkles.

HENRY W. THURSTON.

PLAY AND RECREATION FOR THE OPEN COUNTRY

By Henry S. Curtis. Ginn & Co. 265 pp. Price \$1.25; by mail of THE SURVEY \$1.37.

Dr. Curtis presents what may be considered the latest word in the recreational problem for rural communities. With brevity, conciseness and breadth of view, the subject is presented from the practical standpoint. At the same time the philosophy of play

and its full significance to country life are strongly emphasized.

The introduction gives a general outline of the problem. Play in the farm home is then considered, showing that the mother is the natural social organizer for her home circle. The fireside group, corn popping, chestnut roasting, games, Christmas parties and visiting afford color and culture to home life and opportunity for social development. Family happiness rather than family prosperity should be inculcated as the ideal of the farm home. Practical suggestions are given for play in the doorway with sand bin, slide, swings, tent and home pets, and for outdoor games. The experience of country childhood has been incomplete unless there has been tree climbing, hunting for nests of birds and bees, swimming, and outdoor romps and rambles.

Rural school play possibilities cover four chapters showing the need for equipment of school ground, organization of school play and value of school exhibitions and corn clubs. The broad question of recreation for the rural community as a whole—the opportunities open to the country boy and girl, to the farmer and his wife—is treated in seven chapters. Clergymen, teachers, school superintendents, agricultural secretaries, Y. M. C. A. and Y. W. C. A. secretaries find here a field for service as community social organizers.

The need of play for the adolescent country girl is emphasized. Her life on the farm offers more drudgery than that of her brother whose work takes him into the fields and woods. Some wholesome stimulus to the spirit of ro-

mance and adventure latent at least in every growing girl must be afforded. The rural social center, its ideals, methods and agencies is the final topic, covering five chapters.

Dr. Curtis in his insight, expert judgment and presentation gives convincing proof of the deep significance of the country life movement and its wonderful potentialities for bringing back to the farm some of the poetry and romance of pioneer days; for vitalizing to a truer and more wholesome conception of life our large rural populations; for preventing stagnation and monotony, the bane of many dead rural communities; and for keeping the younger generation on the farm by offering them life that will satisfy the spirit in place of the life that is at present too full of colorless drudgery, and that is driving the farming population, in restless thousands to the already overcongested cities.

MABEL RAINSFORD HAINES.

MUNICIPAL FRANCHISES—2 Volumes

By Delos F. Wilcox. McGraw Hill Book Co. Vol. I, 710 pp.; Vol. II, 885 pp. Price \$5.00 each; by mail of THE SURVEY, Vol. I, \$5.18; Vol. II, \$5.24.

Mr. Wilcox's work embraces two closely printed and compact volumes containing a mass of much-needed and well-assorted data concerning municipal franchises. It is somewhat remarkable and interesting that history in part is repeating itself. During the middle ages

the cities were the centers of commercial and intellectual activity, the hotbeds of politics, as well as the abodes of patrons of art and learning. In fact, to a large extent the history of the period is the history of its cities.

Today, again, the city is occupying the center of the stage by reason of the tremendous aggregation of wealth which it represents and the congested population which finds shelter within its boundaries. It has assumed an importance in American history and matters politic which demands attention.

The tendency in America has been for the population to drift to the cities and the urban population has increased at the expense of the rural.

Coupled with phenomenal increase in the urban population came tremendously vital and perplexing problems in the political lives of the cities as well as in the states in which they were located. There arose also problems of properly housing the congested population, properly transporting them through the cities, properly lighting their homes, supplying them with water, sewage service and schools.

A great mass of people hastily thrown together all intent upon their individual business were very apt to allow a few interested politicians to manage their affairs for them. Hence a great part of the Saturnalia of municipal corruption of the United States, which has

been a source of shame to the country and to its right-thinking citizens.

It is only of recent years that the American public has begun the examination of its own business and intelligently to study municipal conditions. Today municipal franchises and privileges are being regarded as a property of the citizens which are to be parted with only for an adequate consideration. The value therefore of a study of this kind can scarcely be overestimated. Mr. Wilcox is especially fitted to write upon the subject, being chief of the bureau of franchises of the public service commission of the first district of New York and the author of several works on American cities. Here we have in its most accessible form, not only the history of franchises and a discussion of their real nature but a wonderful collection of franchises which have been granted in various American cities, not only under the old pernicious system of private profit but under the modern theory of public benefit.

The evils which have grown from the former system are clearly outlined; the methods indicated of averting them for the future. There are also chapters outlining the history of various public utilities,—electric light and power, telephones, telegraphs, water works, and street railways,—with franchises under which they are operated in different American cities. A particularly valuable part of the work is that dealing with the taxation and the control of public utilities. The author is in favor of municipal ownership.

To the student of municipal franchises, to publicists and those interested in improving conditions within their municipalities the book will be especially valuable. It is clearly, sanely, and logically written and is rich in the collected material.

HOW the small town is to obtain trained leadership in social progress is one of the most puzzling problems incident to the country life movement. The fact that small towns do not yet realize the need for such leadership does not alter the fact that social problems in the village need just as expert treatment as those in the city. It does mean, however, that professional leadership from outside is unwelcome and so likely to be unsuccessful.

The first difficulty is to find the position into which to put the leader without arousing the antagonism of the community. Permanent results in a small town are surest to come from the leadership of a person who resides in the town, and who has as his visible means of support a position in an established institution. Of such institutions, affording the opportunity for social leadership, the church, the school, and the library are the chief, if not the sole, examples. A village library does not ordinarily employ the full time of a librarian; but how it may do so, and, upon the basis of its recognized service, move on to other and broader service, is told in the article on the nameless town, published on page 192.

The second difficulty is to find a man willing to devote his life to a small community who is at the same time big enough to handle those problems. Yet there is a peculiar satisfaction to be derived from the personal, intimate, exhaustive services to the people of a small community. And large results may be obtained by the man who is big enough to see the vision of a small community. Here, again, this article is suggestive, for it is written by such a man.

THE death of Robert C. Hall of Pittsburgh removes a man of social intuition, generous and original. Mr. Hall was one of the first Pittsburghers to grasp the Pittsburgh survey idea, giving the staff the use of offices in the Apollo Building throughout the field work.

This attitude was characteristic, for Mr. Hall espoused the cause of Miss Moore when she started at Aspinwall the first camp school for immigrants in the United States, and supported her legislative campaign to empower other counties to start similar schools, the beginning of a widespread work for foreigners in the industrial districts of the state. He was one of the first backers also, of the Pittsburgh Associated Charities when backing meant both initiative and conviction.

THE JUNIOR REPUBLIC IDEA

HENRY W. THURSTON

THE action of the trustees of the Junior Republic at Freeville in putting on record "their unqualified belief in the moral integrity of William R. George," and the action on the same day of the directors of the National Association of Junior Republics in officially expressing their "continued and complete confidence in Mr. George," are in the nature of decisions by a court of last resort. Although personally interested, these directors more truly than any other persons had "full and complete knowledge of all the facts in all the various matters involved in relation to William R. George."

Taken in connection with the decision of Joseph H. Choate, Samuel Seabury and Miss Wald, quoted in full in *THE SURVEY* of March 14, the action of these two Boards of Directors shifts the whole question as related to Mr. George personally from one of crime and moral character to one of conventionality, good judgment and good pedagogy.

In other words, according to these verdicts there is no evidence to prove that "Daddy" George is other than he has always seemed; namely, a big, warm-hearted, unconventional dynamo of a man whose consuming passion is to try to teach boys and girls to play a square game from free choice and not from external compulsion.

Mr. George is asked by the National Association to "continue to carry on the great Junior Republic work founded by him," by helping to establish and develop Junior Republics throughout the United States.

IN the light of these official decisions as to the character of Mr. George, this question may well be left behind and all future discussion of the man and of the republics established under his influence most profitably be focussed on the three pedagogical problems involved:

What is the Junior Republic idea?

What conditions are essential to make the idea effective?

Among what groups of people is the working out of the idea of practical importance?

As a dogmatic contribution toward such a discussion the following theses are submitted:

1. The Junior Republic idea in essence is that

all immature persons and all persons who are habitually anti-social in conduct must repeatedly have real freedom of choice as to their actions, both as individuals and as members of groups, before they can learn to become really self-directing individuals and effective members of their group.

2. Three conditions are essential to any real working out of this idea:

There must be situations in which there are problems to be solved which the persons concerned regard as worth solving. In the language of athletics there must be a real game to play.

The method of solving the problem must grow out of the nature of the problem itself; it must not be chosen as a method merely because it has proved successful in solving some other problem. The rules of the game must grow out of the game itself.

The immature persons who are trying to solve real social problems together must know each other well. The members of the team need much practice in order to learn how to play a good team game.

3. The George Junior Republic idea, as stated above, is of fundamental importance in all homes, schools, reformatories and prisons whose aim is to produce citizens who have self-control and social initiative.

It is probably due to Mr. George more than to any other one man in America that the Junior Republic idea is now challenging every parent and pedagogue among us. It would be remarkable if some of the conditions which during the evolution of the republic he has thought essential to the working out of the idea do not finally prove to be unessential.

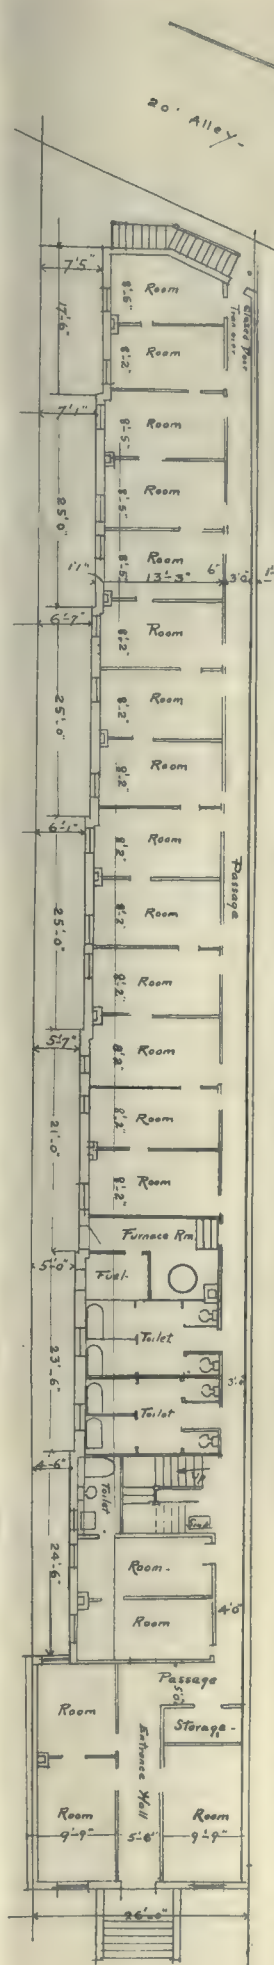

The challenge of the republic idea is nevertheless a permanent one to all the rest of us to show that under different conditions we can get the results he seeks.

WASHINGTON ALLEYS: A PROPHECY FULFILLED

SEVERAL times during the past year THE SURVEY has called attention to efforts of various social, civic and commercial organizations in Washington to secure from Congress legislation which would convert into minor streets the hidden alleys that constitute the capital city's slums.

In commenting upon this proposed legislation it has been prophesied that unless such action were taken, thus giving two frontages to the deep lots, the alley dwelling would be superseded by a type that is even worse, the deep, many-room tenement or barrack that extends back from the street to the rear lot line. To all the disadvantages of the alley dwelling, the tenement adds lot overcrowding, the herding of families, and dark, unventilated rooms.

Such was the prophecy. Already, while Congress dawdled, the prophecy has come true. There has

been erected on Rhode Island Avenue a dwelling which surpasses all our imaginings. On a lot 26 feet wide, which runs back to an alley cutting it at an angle so that one side is 194 feet deep and the other 206 feet, is a house that for two rooms' depth covers the whole width of the lot and then leaves a passage at the side varying from 4 feet 6 inches to 7 feet 5 inches in width. This house extends back 188 feet on the short side of the lot and 193 feet on the long side. A bend brings the rear wall within 6 feet of the rear lot line. Into this narrow space projects an outside stairway that occupies all except $2\frac{1}{2}$ or 3 feet. This is the back yard!

Inside, this iniquitous dwelling is divided into a long series of rooms opening from a gloomy hall 3 feet wide and 166 feet long! Each of these rooms has a doorway opening into the rooms on either side so that they may be rented singly or in pairs. The rear of the house—within three feet of the alley—is, of course, just as much an alley dwelling as is any of those now under the ban.

So the law is flouted by the simple expedient of joining the alley dwelling to street dwelling and so filling up the yard space that used to give light and air to both.

The people of Washington and their rulers in Congress have persuaded themselves that Washington was not threatened by the tenement. Their simple argument was that there are no tenements, consequently there will be none. Now there is a tenement and such a tenement as would not be tolerated on crowded Manhattan. Perhaps with this fact before them they may pass their alley bill and secure an adequate housing code which will ensure that all future dwellings shall provide at least the fundamentals of decent living.

WHEN PEACE COMES TO COLORADO

JOHN A. FITCH

THE federal troops in Colorado may be depended on to disarm the combatants in the warfare that their coming has temporarily ended, to stop the shooting of women and children and to insure safety for human life. But there is one thing they cannot bring to Colorado, and that is peace. Nor will it come until the issues raised in this present strike are settled.

What are those issues?

In the public statement with which he supplemented his testimony before the congressional committee, John D. Rockefeller, Jr., attempted to define them.

His statement is that 90 per cent of the miners have been satisfied and contented and that the strikers were coerced by the threats and intimidations of unprincipled agitators from eastern states; that all the demands of the strikers had been met long before the strike was called or thought of, except the demand for union recognition; that the issue raised is one of personal liberty, because the union, if recognized, would determine who might or might not work in the mines; and that the final issue is "whether the state, or failing the state, the nation shall make good the constitutional guarantee of law and order."

For clarity of expression and apparent conviction as to the large moral issues involved, no other statement from the operators can compare with this of Mr. Rockefeller. It must be read, however, in the light of Mr. Rockefeller's acknowledgment made before the congressional committee that he has not been in Colorado in ten years and has never talked with the miners he believes he is defending. An examination of the facts clearly demonstrates that of these statements the only accurate one is the last. The final issue does concern the constitutional guarantees of law and order, but not as understood by Mr. Rockefeller.

The statement that 90 per cent of the coal miners of southern Colorado are happy and contented would be ridiculous if it were not too tragically false to be ridiculous. During the ten years that Mr. Rockefeller has not set foot in Colorado the miners have worked there under the domination of armed guards, employed by the companies and deputized by the state as peace officers.

Intimidation of the coal miners has been rife as Mr. Rockefeller says. The operators charge that union members have been guilty of it the past year and the Federal Grand Jury backs them up in the charge. Not only last year, however, but for a decade preceding intimidation has flourished, and men guilty of it have been guards which in the words of the same grand jury have been controlled by local companies. They have assaulted and beaten miners who offended them or the company. At the point of the gun they have compelled men to leave camp. They have refused admittance to the camps to men who did not please them, including officials of the state labor department who came under authority of the law

on trips of inspection. They have arbitrarily arrested men, who were behaving themselves, and thrown them into jail.

Does any one believe that 90 per cent of the miners are happy and contented under such a regime? One of the demands of the strikers is for the "abolition of the notorious and criminal guard system." Mr. Rockefeller in his statement does not mention this demand.

A list of demands is enumerated in Mr. Rockefeller's statement, however, and he declares that, excepting recognition of the union, they have been "voluntarily granted" by the Colorado Fuel and Iron Company. These include the eight-hour day, semi-monthly payment of wages, freedom to trade elsewhere than at company stores, the right to a check-weighman and an increase in wages.

The use of the word "grant" in connection with these demands reveals something of the situation that has prevailed in Colorado. Can it be that Mr. Rockefeller, member of the Board of Directors of the Colorado Fuel and Iron Company, does not know that the laws of Colorado require the doing of every one of these things except the wage increase?

Mr. Rockefeller, speaking for the leading corporation, is wholly vague as to the date when his company got around to observing the laws. There are many indications that it was not until the strike was brewing that the coal companies generally began to obey them, and the Federal Grand Jury last fall made no exception in its sweeping charges against the coal companies on these very counts.

A CHECK-WEIGHMAN is a man chosen by the miners to represent them at the scales and keep a record of weights as a check on the tally kept by the employer's representative. The law of Colorado, as is the case in practically all other mining states, requires that the operators shall always allow the selection of such a representative and give him access to the tippie.

Two years ago the Colorado Fuel and Iron Company posted notices on its properties that a check-weighman selected by his fellow workmen would be allowed at any of the company's mines. President J. F. Welborn testified before the congressional committee that, with the exception of one mine, the men have never seen fit to maintain a check-weighman for more than a few weeks. He denied that any request for a check-weighman has ever been declined by his company or the men discharged for asking for one.

The Federal Grand Jury notwithstanding found a general belief among the miners that a demand for a check-weighman would be followed by discharge. Reports of deputy inspectors of the Colorado Department of Labor have for years stated that mine scales in southern Colorado were grossly inaccurate and always on the side of light weights.

J. C. Osgood, chairman of the Board of Directors of the Victor-American Fuel Company, testified before the congressional investigating committee that his company did not regard the eight-hour law until 1913. Mr. Osgood professed to be

lieve that until that time it had not been binding on the coal companies. He intimated that he had had some influence in putting language into the former law which drew its fangs. And yet for more than ten years the Colorado constitution has required an eight-hour day in coal mines. That has also been the clear intent of the law, which, until 1913, every coal company in southern Colorado interpreted to suit itself.

When the Colorado operators cry out for the enforcement of law as the final issue of the strike, they are not coming into court with clean hands. Nor do they carry conviction in their espousal of the open shop.

Mr. Rockefeller declares in his statement that should the union be recognized, all the employes who have not cared to join the union—and he thinks the number would include about 90 per cent of them—would have to be discharged unless they submitted to union dictation. This is a principle, country-wide in its scope, he tells us, and asks whether a small minority of union men shall control the vast majority outside. As a matter of fact viewing the industry as country-wide there are about 750,000 coal miners in the United States, and of these 400,000 are members of the United Mine Workers of America.

To judge of that organization we must look not only to Colorado but to Iowa, Indiana, Illinois, Ohio and the other states where the union is on a peace footing. At a recent hearing before the Commission on Industrial Relations a large coal operator from Illinois testified that in the mid-western field the union had been straightforward and honorable in dealing with the employers, and for the miners it had meant immeasurable social betterment. There the check-off is in full operation, and union dues are taken out of the pay envelopes of all miners by the companies themselves. The same issue of the closed shop was raised in the great anthracite strike, when the United Mine Workers carried their organization into eastern Pennsylvania, and there it was met by an award which left union membership optional with every man, and created a conciliation board which for over ten years has made for peace and mutual understanding.

The terms upon which employers and employes in the Colorado field might work together would have to be threshed out between them, there as in these other districts. But the present strike is for a more elementary principle, the right to negotiate.

JUDGED by their past performance the operators of Colorado are not fighting for the "open shop." They have stoutly maintained a closed shop—closed to organized labor—in violation of a law of the state. True enough, they offered several months ago to yield to many of the important demands of the strikers if they would only give up their demand for union recognition; but what did that offer of the employers involve? It was nothing more nor less than the offer of a promise to obey the laws of Colorado! The strikers refused the offer.

For ten years and more the operators have been

under an obligation stronger than a promise—that of every citizen to obey the laws—and they have utterly flouted that obligation. What reason have the miners to expect now that they will regard a lesser one?

The miners in vain have looked to the state to protect them in their rights. The state has made no effort to enforce the laws. What reason have they to expect better of it in the future? There is just one power left in which they have confidence—the power of their own organized strength.

If further evidence is needed read the testimony before the congressional investigating committee, the report of the Federal Grand Jury at Pueblo, the reports of the commissioner of labor. Go to Colorado, to Pueblo and Trinidad, as did the writer of these lines. Three years ago, on the ground, at every step, he was assailed with facts that revealed a condition of high-handed disregard of law, of labor exploitation and of repression of personal liberty. The half of the story has not been told.

To Mr. Rockefeller also it is a struggle for personal liberty—in defense of which he is willing to risk a fortune. Curiously enough the issue seems to rise with every decade. In 1884 the miners struck and lost. They lost again in 1894 and again in 1904.

Three times in thirty years Mr. Rockefeller's principle has been vindicated. Individual, as opposed to collective, bargaining has been maintained. And three times the miners upon whom the principle has been imposed have emerged again from pit mouth and shaft and have faced hunger, cold, deportation and death in opposition to the Rockefeller ideal. It is a liberty that has made for recurring war.

And so in 1914 the struggle came on again, and men, women and children have been killed. There has been quibbling discussion about who fired the first shot, as if the half of Colorado could be thrown into open war by a single rifle ball! The employers who have disobeyed the laws, the state which has not enforced them; the employers who hired mine guards to assault and intimidate, the state which took those mine guards in company pay into its militia, made some of them officers and then turned them on the strikers; the employers who had machine guns shipped in from West Virginia, the state which took those machine guns and turned them on the tented camps where dwelt the families of the strikers—what answer have they to the question of responsibility for war?

Peace will not come to Colorado with disarmament. It will not come if Mr. Rockefeller spends his fortune in defense of the thing that he thinks is personal liberty. It will not come if the strikers are starved into submission. For with 1884, 1894 and 1904 in retrospect; with Ludlow and Forbes crying to high Heaven in 1914, all precedents point to war again 1924. It is no peace that merely chokes the issue down.

When peace does come, there will be personal liberty. But it will be more than a liberty to toil. It will include liberty to enjoy the fruits of toil. And until there is protection for that liberty there will be no peace.

MIKVEH BATHS

TO THE EDITOR: Replying to the article on Mikveh Baths in *THE SURVEY* for April 18, permit me to say that this question has for some time engaged the attention of the Board of Authoritative Rabbis of the Jewish Community (Kehillah) of New York city. We hope that the rabbis themselves will be able, in the course of a reasonable length of time, to work out this problem in a manner that will meet all Jewish religious requirements and the standards set by the Health Department.

J. L. MAGNES.

[Chairman, Jewish Community.]
New York.

WE HAVE WITH US TONIGHT

TO THE EDITOR: At the recent City Probation Conference in New York two things stuck out like the proverbial stubbed toe and sore thumb. As characteristics common to "conferences" in general these things call for frank criticism in particular, viz: tardiness and dilatoriness of procedure on the one hand; on the other, undue deference to the authoritative self-complacency of presiding officers and to the assumed expert knowledge of "guests", so-called.

All sessions were scheduled for 8 p. m. None began prior to 8:30—some, indeed, as late as quarter of 9. In one instance adjournment took place after 11 o'clock.

Presiding officers had been requested not to "talk" themselves, which, nevertheless, after so stating, one and all promptly proceeded to do, and their "opening remarks" consumed all the way from one-quarter to one-half an hour.

Those called upon to "lead the discussion" should have confined themselves to 15 minutes; but some of the "we-have-with-us-tonights" used up double that time.

"General discussion from the floor" was to have proceeded on the five-minutes-per-speaker basis. The few who responded—chief probation officers, chiefly—far exceeded this limit. They not only spoke frequently in each session, and night after night, but in the majority of instances, many more than five minutes at one time. As a result there was much weariness of the flesh and vexation of the spirit.

On behalf of these gentlemen, however, it should be said that, for the most part, they did address themselves to the subject under discussion and that most of them had something to say at that. The "guests", almost without exception, and the chairmen, one and all, talked platitudes all around Robin Hood's barn.

To be sure, these gentlemen at the outset invariably entered meek disclaimers as to practical knowledge or personal familiarity with the professional

proficiency of the men (let alone women) actually on the job. The court had come to "listen and to learn" at the feet of its own creatures and agents. Indeed, it was much like "carrying coals to Newcastle" for a mere magistrate to enlighten a civil service probation officer either upon the nature of the problems confronting him (or her) or upon the methods applicable to their solution. Duly impressed the officers sat in solemn silence, while the court held forth—and then some!

IDEAL CO-OPERATION

TO THE EDITOR: I stood looking out of my office window, one rainy day, and my attention was directed to the drops scattered over the pane. There was not enough energy in any one of the drops to make it move and there seemed no way to unite them.

Then, one drop that was a little larger than the others rolled down and joined one just beneath it. This made a large drop and it began rolling down the pane, getting larger and gaining force as it went, until it swept everything before it.

Here, thought, I, is an example of what we may do by uniting and throwing our energy into one common cause. There may not be energy enough in a single one of us to accomplish anything, but by quietly uniting our efforts, one at a time, we finally gain such a force and momentum that we carry everything before us.

Since learning that lesson the old adage, "United we stand, divided we fall" has shaped itself in my mind to, "Separated we stand, united we move." Analyze this reconstructed adage and we have, "Separated, we can do nothing; united, everything is possible of accomplishment." This is the great principle of co-operation and makes for the upbuilding of any community, public movement or work of any kind.

THE GUNMEN

TO THE EDITOR: In a recent number of *THE SURVEY* there was a brief sketch of the lives of the four unfortunate human creatures who have been brutally electrocuted. During my eight years' stay in the United States, I never before read a more hard-hearted legalized murder and fundamentally unjust punishment toward so-called "criminals". In the brief sketch of the lives of these four human beings the writer depicts most vividly the hard circumstances and dirty environment these

young men had to live in in childhood.

Personally, knowing the indifference and selfishness of those who are responsible for the making of criminals, I think this method of punishing them is a black stain to our "civilization", a disgrace to humanity and a damnable crime before God and Nature. Let the innocent ones turn the electric current on the murderers, Jesus of Nazareth would say. If society did its duty, by preventing young men from becoming criminals, it would benefit in two ways. It would hasten the Kingdom of God right here on earth, and it would spare itself the occasion of murdering men with the funny pretence of "curing" murder.

There is no doubt the slogan of "prevention" is much better, cheaper and more effective than "cure", morally as well as socially and materially. It shall soon prevail in our means of putting things to rights, and coming generations will smile at our stupidity and lack of common sense, but will forgive us, supposing that we lived in a more barbarous, uncivilized, and unsocialized epoch. They will keep our electric chairs only as reminders of the degree of their moral, mental and social progress.

POLICEWOMEN

TO THE EDITOR: So many inquiries reach me as to how many policewomen there are in the United States and in what cities, that I want to ask the co-operation of your interested and widely scattered readers in compiling a complete list.

This movement has met with great approval and little active opposition, yet there is some opposition, together with indifference and false rumors. These can be met by the ample array of facts and figures now available, if assembled.

At the present time no one knows exactly how many cities have such officers. I have personally spoken in over one hundred cities in the United States and Canada to help secure their appointment and have sent information to many others in response to letters of inquiry, besides addressing three great national gatherings whose delegates represented every section of the country. Yet I have absolute knowledge of but twenty cities where regular policewomen exist. I am sure there are many more.

If *SURVEY* readers will be kind enough to write me giving the names, time of appointment, whether under civil service, etc., I will, from the accumulated data, work out a complete list for later publication in *THE SURVEY*. To make such a compilation valuable it must be accurate.

I will willingly make it comprehensive enough to include all co-operating with, as well as those who are working directly under police departments. But, in order to do so, those sending letters need to inquire carefully and state the exact facts. This is emphasized, since for a while the giving of a star to

women workers in other lines, like charity workers, was hailed by the press as the appointment of a policewoman.

Regarding regular policewomen, the facts to be noted are, whether they are under civil service, whether not under civil service, but paid by the city, or whether paid by clubs or private citizens as a demonstration in the hope that the city will take the work over.

This includes policewomen in small towns who also do the occasional matron work and the valuable travelers' aid agents, some of whom have police stars.

Exact statements regarding local appointments, statements of special difficulties overcome and whatever additional information may be furnished will be greatly appreciated and given back as a co-operative service.

FACTORY HANDS

TO THE EDITOR: It seems to me that THE SURVEY occasionally makes the easy mistake of judging by irrelevant standards. Because a writer would be unhappy if he worked in a factory is no reason why factory hands should be pitied.

In your issue of February 21 was a poem by Howard M. Jones called Plows. It called the manager of a plow factory to task because he failed to appreciate his men, and it rather pitied a lot of the men because they were sweaty and unappreciated.

In the first place, nine times out of ten the factory manager did appreciate his men. He might not talk about them and he might not think of them as being picturesque, but he would appreciate them in a definite, active way. He would know what men were workers and what men were not, and what men were loyal, and what men were cheerful, and what men were trying to improve themselves, and what men were not. He would know their economic worth very accurately, and he would also know whether they had families and children. Also he would be very proud of his best men, but he would not be at all sorry for any of them because they had to work and have sweaty skins.

Why is the idea of a man working in a factory so pitiable? Are not the men who toil and sweat of just as positive service in the world as any of us? Is it not a good thing to work hard and produce? Are not most workers happy doing it? And if workers lead strong, useful lives, are not the men who give the workers a place to work and good tools and machines to work with and sound methods under which to apply their efforts and earn increasing wages? Are not these men, these managers, living useful lives also? And why should a manager who is accustomed to a vigorous environment and strong men and who knows that his men are better off than their fathers and happier than if they loafed, why should he speak of his men with a sob in his voice?

It is true that if a poet worked in a

plow factory he would be miserable. In his case, a few soft words of sympathy from the manager would not fall on barren ground. But plow-makers are different—fortunately for our country which still has many fields to be plowed—and plow makers, in their way, are happy no matter how distant the manager's manner may be. They are strong men and they do not need indiscriminate pity.

VIOLETS

An Industrial Poem

There were a thousand men in the factory;

Some thrummed guitars,
Others ran whining emery wheels
Cooled in Florida water.

In an electric brougham, a workman passed by me;

His handsome curls twined with violets,
Beside him a plowshare.

After him came another man

In a morning coat,
Hands full of orders

Which he tore up and threw away
Gaily

He seemed happy to me, but the manager
Wept softly to see him work.

Later in the office,

He told me proudly

That of all the men in the plow business,
His were the handsomest.

CHANNING TURNER.

Geneva, Ill.

TO THE EDITOR: Mr. Turner's letter is so entertaining and his parody so amusing that I don't want to spoil it by saying anything, except, of course, the perfectly evident fact that he has entirely missed the point of my poem.

HOWARD M. JONES.

Madison, Wis.

JOTTINGS

LONDON LECTURER COMING

Rev. James Marchant, F.R.S., director and general secretary of the National Council of Public Morals for Great and Greater Britain, will arrive in this country May 17. He is on a lecture tour which will include visits to the large cities of North America, Australia, Africa and New Zealand. His first lecture here, on The New Gospel of Race Regeneration, will be in the Y. M. C. A. auditorium, Brooklyn, May 18, under the auspices of the World's Purification Federation and the Y. M. C. A.

PUTTING OUT RED LIGHTS

Mayor Baker has agreed to co-operate with the Cleveland Federated Churches in gradually eliminating the segregated district. The first move was to order that no patron might carry liquor into a resort—sale of liquor in them had been prohibited for some time—and that a resort once closed was closed for good and could not reopen under any circumstances.

SCOTT DECISION REVERSED

The Supreme Court of New Jersey has reversed the decision of the county court of Passaic where Alexander Scott, editor of a labor paper, was sentenced to a term in prison for "hostility to government" in criticizing the Paterson police during the silk strike.

The opinion points out that if the law could be interpreted, as it was in the county court, it would be a crime to urge the retirement of an administration and the election of members of an opposing political party.

NEW YORK CITY CONFERENCE

Public health, families, settlements and recreation, municipal needs, delinquency and children are the major topics to be discussed at the fifth New York City Conference of Charities and Correction, May 19-21. The opening session will be held the evening of May 19 in the Polytechnic Institute Hall, Brooklyn. The sessions of May 20 will be held in the United Charities Building, Manhattan. On May 21 a visit will be made to the Lincoln Agricultural School, Lincolndale.

RELIEF ON CENSUS LINES

The divisions of Manhattan and Bronx, New York city, used by the Federation of Churches and the Census of 1910, have been adopted as districts by the Association for Improving the Condition of the Poor. This gives a basis for direct comparison between the association's family records and the census statistics of race, age, immigration, and the like. The number of nurses and visitors has been increased.

NATIONAL EMPLOYMENT-BUREAUS

The federal Industrial Relations Commission has proposed a system of employment bureaus and labor clearing-houses to cover the whole country with a national bureau in charge at Washington. An advisory council would be made up of equal numbers of employers and employees. Public hearings on the proposal began May 4 in New York.

COMMON WELFARE

AMERICAN TRAINING FOR BULGARIAN NURSES

ONE OF THE announced purposes of the coming visit to this country of Queen Eleanora, of Bulgaria, is to afford her majesty an opportunity to study American hospitals. Out of her interest in Bulgaria's nursing and hospital needs, quickened by the recent wars, has already sprung an arrangement with the American Red Cross which will result in giving American training to Bulgarian nurses in this country and in the sending of a Red Cross nurse to take charge of a training school for nurses in Sofia.

Through Madame Bakhmeteff, wife of the Russian ambassador to this country, Queen Eleanora made her appeal to the Red Cross. Accompanying her letter to Madame Bakhmeteff was the following statement of the queen's plan:

"Her Majesty Queen Eleanora wishes to establish a training school for nurses on the American plan, in the State Alexander Hospital, in Sofia. To this end she wishes to have four young Bulgarian women trained in the United States. She would like to find a hospital of good standing where they would be given their training, their board and lodging, free. In order, however, to be able to begin the training school now, when interest in nursing has been awakened by the last war, the queen would like, if means could be found in America, to engage a superintendent who could begin the work and get it well started while the young women were being trained. At the end of this time the queen hopes to have demonstrated the ability of the training school, and that the government will then arrange to have its expenses included in the regular hospital budget."

Helen Scott Hay, superintendent of the West Suburban Hospital, Oak Park, Ill., who has consented to go to Sofia to start the training school for nurses, will leave, it is expected, in August. The School for Nurses of the Presbyterian Hospital, New York, has agreed to take four nurses from Bulgaria and train them free of charge for three years.

Miss Hay is prominent in the work of many of the national organizations for nurses in this country and has also had a general teaching experience.

The children's judge of Denver expresses his opinion of "Beauty for Ashes," the autobiography of a housing reformer, appearing serially in THE SURVEY. Next installment June 6.

It just seems to have been impossible to go over Mrs. Bacon's story until recently. It is a wonderful story—just the kind of a story that ought to have been written a long time ago. The conditions and the difficulties described by Mrs. Bacon are those met with in nearly every city, large or small; and in writing the story of her own experiences in one city, she is writing what might be the experiences in every city. It should be an inspiration and a help to others and multiply the Mrs. Bacons throughout the country. We are sadly in need of them.

The kind of opposition and difficulties, pointed out by Mrs. Bacon in her most interesting narrative of personal experiences, will exist as long as communities are indifferent and fail to produce the type of woman who is sincere, sane, sensible, earnest and determined in calling attention to housing conditions, and other conditions that have to do with poverty, misfortune and crime, not only in the great cities but in the small cities and even the towns.

The articles are most entertainingly and interestingly written, and I sincerely trust will be published in book form and have the circulation they so richly deserve.

BEN B. LINDSEY.

Denver, Col.

PAGEANT OF THE NATIONS IN NEW YORK

A FESTIVAL AND PAGEANT OF NATIONS—aiming to interpret, not America to the foreigner, but the foreigner to America—is to be given in New York city June 1-6 by the the People's Institute. It is to be in large part the product of the immigrant and one of its purposes is to make the immigrant feel that there is a place in this country for his native customs and national ways.

Entertainments by different national groups will be given at Public School 63 each day from June 1 to 5. The pageant will occur on the sixth. A dozen nationalities will participate, each contributing a spectacle of something worthy in its native life. Nora Van Leeuwen, of the People's Institute staff, who has planned the pageant, describes it as follows:

"The pageant will go in a long procession through the streets of the lower East Side. There will be ten or more different groups of school children in costume, with banners and music, and a still larger number of adult groups representing the nationalities. There will be floats, streamers and cavalry. The procession will move to a great, bare field, in Eleventh street.

"All around this field there are looming tenement houses. These will be ablaze with color. The real pageant will be held on the field. The children will represent, in a rapidly moving pantomime, the human history of the neighborhood, beginning with the Indians and ending with the rise of the school house. Then the foreign societies, each in turn, will give a brief, striking presentation of that which they consider most worthy of their national name and national pride.

"But each nationality, before it exhibits its own national stories, will lay an appropriate gift at the feet of a great triad of figures representing the three races whose amalgamation is producing the new America—the Teutonic, Latin and Slavic—with a representation of Liberty rising above them all.

"Then the children will build instantly, right out in the arena, a school house. There will be a symbolic presentation of the quest of the people for a place to meet—the saloon, with its open arms, and the school house and church, with closed doors. Then will be seen the

POW-WOW OF BOY SCOUTS, INDIAN BRAVES, CAMP FIRE GIRLS

THE INDIANS, BOY SCOUTS AND CAMP FIRE GIRLS AT DINNER

Many a Boy Scout visits an Indian encampment to see the braves and their mode of life, but few Indians ever visit their pale-face brothers in the city. It was a unique experience at Spring Street Neighborhood House, New York, the other evening when Chief Iron Tail, head of the Sioux tribe for twenty years, Chief Black Fox, their wives, Charlie and Susie Yellow Boy and an interpreter came down from 101 Ranch, Wild West Show, to eat dinner with the oldest Boy Scout troop in the United States, Troop Nine of New York city. Some Scouts from Springfield, Mass., and a number of Camp Fire Girls were on hand also.

Chief Iron Tail, whose profile adorns the Buffalo nickel, assisted by Chief Black Fox and little Susie Yellow Boy, showed how he danced after the massacre of General Custer and his troopers at the battle of Big Horn Creek in 1876.

The chief grunted his approval of the Camp Fire ceremonies and the Scout stunts. Many of the boys and girls are treasuring copies of the old Sioux leader's thumb-print.

CHIEF IRON TAIL WITH HIS HAND ON A SCALP

coming of the social center and the organization of the human life of these crowded neighborhoods into public school buildings. As a finale there will be a flag tableau, in which the children will form a huge American flag and the foreign societies will salute it with their own banners."

It is hoped that this pageant will help to point ways in which the immigrant may enrich not only his own life in this country, but that of Americans as well, by holding on to a part of the rich stores of his national customs.

Miss Van Leeuwen says it was a shock to her to be told by a prominent Servian that among the thousands of Servians in New York not a single national costume could be found. Servian immigrants had either exchanged their native dress for American outfits before coming here, or had disposed of them after their arrival.

"It is pitiable," she says, "how little we have of their wonderful customs, of their beautiful traditions, of their loy-

alty to their countries, and to the ideals they know, and their willingness to expose all this if they only had the occasion."

ACCIDENT PREVENTION IN MINNESOTA

THE PEOPLE of Minnesota were astounded when the Labor Department's report for 1910 showed that 251 fatal accidents and 8,137 non-fatal accidents had been reported by the industries of Minnesota (exclusive of the railroad transportation, maintenance of ways and construction accidents) for the fiscal year ending July 31 that year. A vigorous safety campaign was at once inaugurated.

During the four years that have since elapsed there has been a steady decline in fatal accidents. In 1913 there were 136, a decrease of 46 per cent. This does not fully reveal what has been accomplished in accident prevention. Agricultural fatalities, which had been averag-

ing from 11 to 12 a year, jumped to 21 in 1913, while the railroad shop and mercantile industries had an unusual series of peculiar mishaps which increased the railroad shop and repair yard accidents from an average of 3 fatalities a year to 11 in 1913 and the mercantile industries from an average of 4 a year to 10 in 1913. If those three industries had not had such abnormal fatality rates in 1913 the decrease since 1910 would have been 56 per cent.

In the mines there was a decline from 83 fatalities in 1910 to 28 in 1913, and in lumbering and woodworking from 55 to 18. Many other industries reveal similar decreases. Non-fatal accidents, in spite of the fact that they were much more completely reported in 1913 than in 1910, declined from 8,137 to 5,490, a decline of 32.6 per cent.

UNIVERSITIES AND THE PUBLIC SERVICE

AT THE conference on universities and public service, held in New York May 12-13, under the auspices of the committee on practical training for public service of the American Political Science Association, Mayor Mitchel sounded the key note in his opening speech. He had observed that college men could not carry the duties of public service without a period of training, and urged that opportunity be given the college man to secure practical contact with public affairs while in college.

The opportunities of public service as a career furnished an interesting discussion in which the city manager, the consular service and civil service reform were particularly emphasized by different speakers as leading to openings for remunerative and distinguished service.

Charles McCarthy, chief of the Legislative Reference Library of Wisconsin, and chairman of the practical training committee, described the need for practical study of legislative affairs and the advantages of such a study over the stay-at-home methods usually employed in the past by students of civic affairs.

Dean Hicks of the University of Cincinnati described the close relations between his university and the city, and succeeding speakers showed the opportunity of co-operation between the universities and the municipality in New York city and what has already been accomplished.

During the discussion of public service activities of the universities, Director Cooke, of the Department of Public Works of Philadelphia, described the help given to his department by university professors, and Professor James of the University of Texas told how his graduate students were making surveys that had attracted wide notice. The university of Texas has established a

bureau of municipal research and reference and a school of city administration.

A national university, to use the facilities of the national capital as a laboratory for political science students, was advocated by Chancellor Brown of New York University. Mr. McCarthy led the discussion on the question of giving credit in the universities for work done in municipal research and legislative reference bureaus. The plan of the committee on practical training for public service provides that one year of practical work in selected bureaus be counted toward the degree of Ph.D. in universities. The committee will inspect these bureaus and designate certain of them for this work, on the basis of supervision and facilities given to the student. This plan has already been put into action by Mr. McCarthy in Wisconsin.

Professor Holcombe of Harvard, described the advantage to the college man of entering practical public affairs. The Training School for Public Service was described by Leroy E. Snyder of the New York Bureau of Municipal Research. In this school, which is conducted by the bureau the program of practical civic work as outlined by the conference is being carried out.

A resolution was unanimously adopted for future annual conferences. The descriptions of work already accomplished and the opportunities still to be grasped appeared to foreshadow a greatly increased activity on the part of the universities to come into closer contact with actual political conditions.

STRIKE BREAKERS BANNED IN COLORADO

THE ORDER of the President of the United States, prohibiting the importation of strike breakers to work in the Colorado mines, and ordering the deportation of all who have been brought in since April 20, the date of the Ludlow battle, is the unique feature of federal control in the Colorado strike districts. Already a number of men who were brought into southern Colorado after that date have been put on trains and sent out of the mining section.

This is probably the first time in America that such a course has been followed by troops policing strike territory. It is not unfamiliar, however, in England. The theory seems to be one of maintaining a strict neutrality. The troops will not permit the strikers to interfere with men at work before the recent outbreak of hostilities, but on the other hand, they will not allow their presence to be used as an opportunity for the commission of overt acts on the part of the operators tending to strengthen their position.

The disarmament of strikers, militia, sheriffs and company guards is going slowly forward.

THE MASTER CRAFTSMAN AT WORK

A marvelous desk did fifteen-year-old Emri Techa fashion. Of hard oak wood he made it, true to his own careful plans. Four-square it stood when finished, resting evenly upon slender legs which pressed the floor at each point. The top was broad and smooth. In the back a drawer was craftily set, nicely dove-tailed and mortised together, fitting perfectly in its socket. On the shelf surmounting the drawer were pen-racks of beaten copper, hammered out of the red metal by Emri, youthful master-craftsman.

Rightly proud was Emri, when his desk finally stood the wonder of all who visited East End Neighborhood House in Cleveland, Ohio. There it was that he wrought out his ideas of desk-craft in the short afternoons after school hours and in the long winter evenings. As he labored, increasing cunning came to his firm fingers, to his strong arms and to his vigorous young brain. The joy of creative work was his in increasing measure as the desk grew under the teeth of his saw and the blade of his plane.

But as he worked, his thoughts winged above the crowded neighborhood in which he lived, to a glorious future which he might in time make for himself and those he loved with the cleverness of his hands and the keenness of his brain. And as he thus wrought in the days which are yet to come, those who guide the fortunes of the East End Neighborhood House saw part of their problem solved; for their mission is to provide inspiration to the better things of life for the many groping people whom they serve.

Shortly afterward, all the people of the neighborhood were given a chance to see the work of Emri and his ten youthful fellow-artificers. A great store window blossomed for a week in April with many useful articles besides the desk—made by Emri and his comrades. Footstools, tabourets, lamps, chairs, pedestals, cup-and-saucer racks and many other bits of furniture were there displayed.

To the name of Emri, desk-maker, stood, in addition to his masterpiece, a chair, a lamp and a footstool. And as those who passed were seen to marvel at evidence of such skilful industry, the eyes of Emri, master-craftsman of fifteen years, glistened with pride, and his soul expanded with the joy of artistry fulfilled.

MEDIATION PLAN OF INDUSTRIAL COMMISSION

OF SPECIAL INTEREST in connection with the events above outlined is the tentative draft of a bill drawn up and submitted to the United States Commission on Industrial Relations by the commission's staff, creating a national board of mediation and conciliation to deal with all strikes and lockouts in any part of the country that seem likely to involve the federal government.

A memorandum accompanying the bill points out that within the past year Congress has been called upon to investigate strikes in the three states of West

Virginia, Michigan and Colorado, and that in the latter state federal troops had to be called in. All of these strikes involved interstate shipment of gunmen and strike-breakers.

The bill provides strictly for voluntary conciliation, and expressly denies to the board any compulsory powers of arbitration or prohibition of strikes or lockouts. In this way it avoids all conflict over any question of state or interstate jurisdiction.

A precedent for a federal commission is found in the Anthracite Coal Strike Commission of 1902, which settled the great strike in Pennsylvania. It is

TIME EXPOSURES *by* HINE

OUTSIDE "THE POOR MAN'S CLUB"

pointed out that all efforts at conciliation by the federal government in recent strikes have failed, and that if intervention is to be resorted to, it is advisable that the government have a permanent board, representing the entire nation and having the confidence of both employers and employes, to be of service at the very inception of such disputes.

One of the important features of the bill is its plan for co-operation with state boards of mediation whenever such exist, and its plan for joining with such boards in any section of the country for united action whenever a dispute extends beyond the limits of a single state.

DRASTIC PRISON REFORM URGED IN NEW YORK

A NEW TURN has been given to the movement to abolish Sing Sing Prison, New York's antiquated mausoleum on the Hudson. The State Commission on Prison Reform, of which Thomas Mott Osborne is chairman, has recommended to Governor Glynn that the place be converted into a receiving station for the observation and study of all persons sentenced to a state prison, for the medical examination and treatment of those afflicted with disease and for weeding out those found to be mentally defective.

Among other recommendations in the report of the commission, made public last week, is one that a Court of Rehabilitation be established, and indeterminate sentences given all persons sent to state prisons, in order that the reformation of law-breakers may be determined as accurately as their guilt.

In urging the abolition of Sing Sing, the commission calls attention to the "incredible fact" that public opinion has for over half a century been aware of the barbarity of confining human beings in the cells there and yet has let the institution remain—"a disgrace to a civilized community." The commission calls strongly for the erection of a new prison to take the place of Sing Sing. The new prison, it declares, should have a site of 2,000 acres, consisting of forest and arable lands, and should not be more than 100 miles from New York city.

With reference to converting Sing Sing into a receiving station the commission says it contemplates the establishment of a hospital and neurological institute as well as place of detention and observation. This will require, it points out, the services of a staff of genuine experts, physicians and officials of special training, broad sympathies and knowledge of human nature. The cell block will not be needed for this purpose and should be abandoned.

In urging sentences without maximum or minimum limit for all persons sentenced to state prisons, the commission declares that "the unequal sentences imposed by different judges for the same offense, or even by the same judge at different times, is little short of a scandal in the administration of our criminal justice, and creates in those discriminated against a rankling sense of the injustice and inequality of the law."

The idea of a court of rehabilitation to determine when prisoners are fit to be returned to society was first given prominence some years ago by Roland

B. Molineaux, and has since been strongly urged in Texas. Such a court, as usually conceived, will be a court of record to try a person for release on the evidence of his conduct in prison. If he has been given an indeterminate sentence, as the commission urges, the court can diminish or prolong his term as it sees fit.

The commission declares: "While perfect justice cannot be expected from any human instrumentality, it is conceived that a single court, acting for the entire state, and sitting as a Board of Parole or Court of Rehabilitation will be much more apt to administer an equal justice than is possible under the present system. Under such a system it will be the prisoner and not the crime that will be tried.

Pending the creation of such a court, the commission recommends the establishment of local advisory boards, of three or five members each, for each prison and reformatory, for the purpose of investigating all applications for pardon or parole.

Believing that the greatest obstacle in the way of real prison reform in the state is the confusion and demoralization in the prison administration, the commission urges as the necessary ground work of all other changes the consolidation of all offices, boards and commissions into a permanent state department of correction. In this it recommends the vesting of the entire penal administration of the state.

Among its other recommendations are a separate institution for the care of all adult mental defectives convicted of crime; the "honest, efficient and business-like administration" of all systems of prison labor in the state; the creation of an employment bureau for paroled and discharged prisoners in the office of the superintendent of prisons; and the establishment of a thorough system of education in the penal institutions under the state commissioner of education.

PURE FOOD LAWS: SANITARY AND ECONOMIC ASPECTS

IS THE pure food law of real use? Does it actually protect the average citizen? Or help to reduce the cost of living?

To these big questions an answer was offered at the New York State Conference of Charities and Correction this week by Dr. C.-E. A. Winslow, curator of public health, American Museum of Natural History.

Dr. Winslow's belief was that "as actually enforced the pure food law has had an infinitesimal effect in the prevention of disease and has often tended to increase rather than decrease the cost of living."

This failure Dr. Winslow considered due to the point of view of early exponents of the law. Thus far the greatest emphasis has been laid upon ques-

tions of adulteration and preservatives, and of correct labeling.

"There is, of course" he said, "an important economic and ethical question involved in the control of adulteration and misbranding, aside from the supposed sanitary one. . . . foods and fabrics and all other products on the market should be what they appear to be. . . . "[Yet] other dangers to our food supply, much more real, need emphasis.

"The most serious of these dangers are due to the pollution of some food-stuffs like water and milk which are often consumed raw, and of other food-stuffs after cooking, by human excretions, which are always likely to be the bearers of the germs of communicable disease. The safeguard against such dangers must be two-fold: first, the exclusion as far as possible of sick persons and carriers from the business of food preparation; second, a standard of general cleanliness to minimize, so far as may be, the amount of excretal matter from the respiratory or intestinal tract, which is smeared on food by unrecognized cases. This involves a strict supervision of kitchens and serving-rooms and a campaign of education reaching the individual in the home where so many cases of typhoid fever and other intestinal diseases, and of colds and tonsillitis and other respiratory diseases, originate in prosodemic fashion.

"The possible infection of food by flies is another real danger which well deserves the attention it is now beginning to receive, and the same dangers to which all foods are liable after cooking, pollution by mouth spray, by handling and by flies, menace foods, such as fruits which are to be eaten raw, in the store as well as in the kitchen."

It is important, of course, that poisonous matter shall not be mixed with food products, and that food products shall be properly labeled. But attention should be concentrated more largely upon suppression of the traffic in unclean milk, meat and vegetables and other products that may carry disease.

Important to any progress, Dr. Winslow emphasized, must be patience on the part of those who watch and wait, while scientists study and report results.

Violent prejudices which once existed against canning and cold storage have been allayed; the question of preservatives needs further study that their effects in varying amounts and under varying conditions may be determined. There are certain household preservatives, like salt, sugar, cloves, etc., which are familiar and approved without question. Certain other preservatives, newer and less familiar, still suffer under the terrible reproach of being "chemicals." "Why sodium benzoate is a chemical and sodium chloride is not, is a puzzle to the scientific mind."

In closing, Dr. Winslow appealed for co-operation of all social workers:

"It will take the work of years by trained experts with a single-minded desire to find out the facts and use them for the public good to get from the pure food law a maximum of efficiency, sanitary and economic. You, as social workers, will have an increasingly large part in this task, for the whole business of better social organization is your province and you are each year possessed of greater power in molding public opinion for good or for ill.

FAILURE OF EFFORT TO STOP FORTUNE-TELLING

IN THE BUFFALO State Hospital for the Insane a nineteen-year-old boy has been slowly recovering the past winter from insanity brought on by the pretended disclosures of a fortune teller. While his delusions continued the Legislature failed to pass a bill which would have made it possible to punish more effectively this class of charlatans. Meanwhile hundreds of fortune tellers are still doing business at the old stands.

The boy referred to came to New York last year to find work. He was employed as draughtsman's apprentice in a down-town architect's office and for two weeks gave excellent service. Anxious to know what the future held for him, he went to a Sixth Avenue fortune teller.

This man declared that by reading the stars he could foresee a dreadful calamity

in store for the youth. He added that he could divert it for fifty dollars. The boy, who had paid the magician four dollars for every previous visit, answered that he didn't have that much money. The fortune teller kindly agreed to receive payment in installments of four dollars a week.

To make these payments the boy began to deny himself food and other necessities. His work suffered and he was discharged. One day, in an attempt at suicide, he jumped into the Hudson River from the West Thirty-ninth Street pier. He was rescued before dead and sent to a hospital, where he was adjudged insane.

A lieutenant of police tells the story of a girl who was chloroformed and assaulted by a fortune teller and who became insane as a result. These cases probably represent an extremity of evil to which the practices of fortune tellers do not often carry. For the most part they are content to swindle.

The law at present permits a magistrate only to place fortune tellers, who are legally defined as disorderly persons, under bonds to keep the peace. They can not be fined or imprisoned unless the bonds are forfeited. This almost never happens.

"If a couple of dozen of these men and women were sent to the workhouse for two or three months," says Chief Magistrate William McAdoo, "it would do more to break up fortune telling than any other thing I can conceive of. Some people think fortune telling is a joke, but really it is a very serious evil."

The bill presented to the New York Legislature was drawn in Mr. McAdoo's office at the suggestion of the Joint Application Bureau. It made fortune telling for a consideration, or telling where lost or stolen goods could be found, a misdemeanor, thus enabling magistrates upon conviction to impose prison sentences of six months.

The failure of the bill marks the defeat of the first positive effort in New York to make fortune tellers as serious offenders in the eyes of the law as their evil effects justify.

UP THE ROAD

CHARLES S. NEWHALL

"FRIENDS of mine along the way,
Whither bound this windy day?"

"Join us, friend, our way is one,
Up the road, till day is done;

"Up the road toward light of Home
Shining far for all who roam,
Shining for us brothers all,
Lest we falter, lest we fall;

"Up the road, with words of cheer
Fit to banish every fear,
Helpful deeds and kindly smiles,
Easing so the wind-swept miles.

"Up the road we brothers all!
Brave to answer every call;
Up the road, till day is done
And the goal at last is won."

INDUSTRY

EFFORTS TO STANDARDIZE CHICAGO RESTAURANTS —THE HENRICI STRIKE—BY ELLEN GATES STARR

A pioneer resident of Hull House tells in this article something of the difficulties encountered by unionists who attempt to keep within the law and yet make a strike effective. In the Henrici strike the police made arrests freely, although the Illinois law permits peaceful picketing. The courts have seemed to lend their aid to this harrassing of the union, for to date not a single striker's case has been tried, although they have sometimes been arrested twice in one day.—Ed.

At Henrici's restaurant in Randolph St., Chicago—which it is not claimed is worse than many others—the bakery is wholly underground. Since February 28, 1910, it has been illegal to build underground bakeries. There is no window whatever in the kitchen and the bread bakery; the only ventilation is by an air shaft; at night there is often no power on for mechanical ventilating purposes though there is a night shift; the sweat of the bakers frequently drops into the bread. These facts given me by cooks and waiters I have verified at the office of the Bureau of Sanitary Inspection.

For six months previous to February 5, the beginning of the Henrici restaurant strike, unions of waitresses, cooks, bakers, milk-wagon drivers and delivery-wagon drivers had been negotiating with the restaurants in the "loop" district to the end of establishing a scale of hours and wages; in fine, of standardizing their industries in that district.

The waitresses' main demands were for one day's rest in seven, \$8 for six days' work (instead of \$7 for seven days' work), as a first step toward freeing them from the pernicious tipping system; and, as always, for recognition of the union, without which no contract is of the slightest value.

Why the Strike Was Called at Henrici's

One hundred restaurants had signed the agreement; Henrici's was the first to refuse and was thus naturally, and not arbitrarily as the Henrici manager alleged, the point of attack. The manager not only complained that his restaurant was unfairly singled out, but that it was unfair to proceed against any one restaurant. He maintained that some measure should be adopted applying to all at once.

Obviously, the only kind of measure which could so apply would be a legislative measure, and it must be remembered that, whenever any attempt is made at legislation to improve the conditions of hours, wages, etc., in restaurants, the Restaurant Keepers' Association is promptly on hand to defeat it.

The four union waitresses engaged at Henrici's were dismissed—on pretended charges—after having been followed by detectives to their union meetings. The two union cooks, of a total of four, and six union bakers, of a total of eight were called out on an officially declared strike; also the milk and delivery wagon drivers. No attempt was made, as is usual in strikes, to influence the waitresses remaining at work either to come out or to join the union at that time. This caused misunderstanding which served to allay public sympathy, and was probably a tactical mistake.

The reason for this inaction was that the season had been a severe one by reason of unemployment. Any strike, at any time, implies a tremendous drain upon union funds. The Henrici Company promised to discharge any waitress who joined the union at that time and, in case the union won, to pay the initiation fees of all those who had staid in. It was decided to be the most fair and humane course to fight it out without disturbing those within; but it gave apparent ground to the Henrici adherents, who constantly stated that no waitresses were on strike, and as constantly ignored not only the locked-out union waitresses but the cooks, bakers, and milk and delivery wagon drivers who were on strike.

The public, which had complained in the last garment workers' strike that pickets had attempted to call out all the workers, now objected that they did not. The lockout of union waitresses and strike of union cooks, bakers and milk and delivery wagon drivers, was named solely a "boycott."

Mr. Collins, president of the Henrici Company, by his own statement on the witness stand, paid between \$1,300 and \$1,400 to the Chicago newspapers for printing his statement of the situation. Only one paper—the *Evening Post*—would print the union statements. There remained to the union the method which is usually left to unionists on strike—to make their statement as well as they could in the open street.

Peaceful picketing has been pronounc-

ed legal in Illinois by repeated court decisions. The instructions given to the pickets by their unions were explicit—never to touch anyone, nor to stand still in front of, or near, the Henrici premises obstructing passage. Peaceful picketing, it is maintained, includes the right to give information in a quiet way. It should be remarked that passage was really obstructed by groups of from twelve to twenty nondescript persons wearing no badge of authority—plain clothes men, private detectives and men who stopped to talk with them and who were not ordered to "move on."

"Peaceful Pickets" Arrested

Although the instructions were carried out, arrests were repeatedly made and with increasing frequency, the same persons being twice placed under arrest and released on bonds during the interval between 12 and 2 o'clock. More than 125 arrests were made. The charge at first was for conspiracy, a state offense for which the bond required is \$1,000. Sometimes both conspiracy and disorderly conduct were charged; in this case the bond was \$1,400.

A section in the Municipal Court act provides that judges may enter an order of record authorizing police officers to accept bail. The attorney of the unions, Edgar L. Masters, considering the \$400 bond for alleged "disorderly conduct" four times as great as it should have been, sent to find what the order of the court had been, and learned that the court had entered no order, and the police were fixing the bonds at their own pleasure!

The arrested persons were arraigned and assigned to a hearing in the Municipal Court where the cases were perpetually continued on motion of the prosecution. Judge Ryan at last refused to allow any further conspiracy charges until a case should have been tried.

The strike began on February 5 and up to the present time, May 7, no case has been tried either for conspiracy or disorderly conduct, although a committee appointed by the City Council for the investigation of police procedures passed resolutions urging the speedy trial of these cases. Untold time of the defendants has been wasted by the cases being so often called and continued, and more than \$130,000 has been furnished in bonds by unions and sympathizers.

Added to this abuse of power, were charges of police brutality, substantiated by the sworn evidence of two injured waitresses and of a physician who attended a waitress whose arm was so badly wrenched that the attending hospital physician (Dr. Hedger) was unable, until she had had an X-ray taken,

The Survey, May 23, 1914.

to tell whether or not it was broken. Also by the careful statement, out of court, of Dr. Bertha Van Hoosen, surgeon at the Mary Thompson Hospital.

On February 22 a meeting was called at Hull House to suggest measures for investigating the conduct of the police. Jane Addams, head of Hull House, presided and Mrs. Joseph T. Bowen, president of the Juvenile Protective Association, offered resolutions. A committee was appointed by the chair to attend court proceedings. At that meeting was circulated a leaflet, "Facts Concerning Henrici's," issued two days previous by the Women's Trade Union League, stating the grievances and demands of the unions. This leaflet was sent to the daily papers but appeared, so far as I know, in the *Evening Post* alone.

Arrested for Disorderly Conduct

I was present on Randolph Street four days between February 22 and March 2; on the fourth day I was put under arrest. I went there for the purpose of getting first-hand knowledge of the situation, of preventing recurrence of brutality, if I could, by my presence, aid in doing so, and of protesting against illegal and unwarranted arrests.

I composed a fixed formula for use in case of witnessing such arrests, which I had occasion to use three times: "As an American citizen I protest against the arrest of these persons who are doing nothing contrary to the law." I was arrested on the third occasion of reciting it in a clear but ordinary tone. No answer was made to my inquiry of the arresting officer as to the charge, but I was booked at the police station on a charge of disorderly conduct, which was sworn to by the officer, and on my declining to send for bail I was placed in a cell but released shortly thereafter on the bond of a friend who appeared and offered bail. (It has not been the policy of the trade unionists to decline bail and suffer imprisonment.)

This sworn charge was afterward changed, without any assigned reason, to another charge (sworn by the same policeman) of "interfering with an officer in the discharge of his duty." To my mind it is clear that the charge was made for two reasons: to avoid the incitement to mirth and consequent disadvantage to the prosecution of a middle-aged gentlewoman appearing on a charge of disorderly conduct; and, more important, that my case, pushed on to earlier trial, might not furnish a precedent for the many cases of waitresses arrested on the former charge. It was, of course, precisely to furnish that precedent that I had been anxious for an immediate trial.

The prosecution (the city) adopted the same policy of moving continuances, as in the cases of the arrested waitresses. My attorney, Harold L. Ickes, however, succeeded in urging the trial on after four continuances, against a further motion for continuance on the part of the prosecution. The only witnesses on the side of the prosecution were four police officers who overreached themselves and swore to state-

ments nobody believed, and which made the fabrication of their entire testimony evident. The jury returned a verdict of "not guilty."

This brief outline of my personal experience is interesting only as it gives some very slight idea of the system of harrying to which unionists on strike are subjected, and the illegal excess of power assumed by the police. It would be next to impossible to an outside sympathizer, even if one had the courage to try, to find out by personal experience the extent of what the real combatants suffer, for the reason that methods are immediately and considerably modified by the presence of outside witnesses.

My relation to the Henrici strike was given a significance which it would not otherwise have had by a meeting of downtown business men (some of whom have restaurants in connection with department stores), in which they passed resolutions requesting Miss Addams to "withdraw her representative." Miss Addams' reply was the obvious one—that I was not acting as her representative and that she had no authority to "withdraw" anyone, even if she wished to do so. This action of the business men was telephoned me, the night before its appearance in the daily papers, by a press representative, together with the question "Isn't Hull House supported by contributions?"

A Two-Edged Conspiracy to Injure the Union's Business

A legal procedure of great importance was that in which three judges, McGoorty, Baldwin and Windes, sat together to hear and decide upon an injunction bill filed by the Philip Henrici Company against the waitresses' cooks' and bakers' unions, and a cross bill filed by the defendants in the above, against the Henrici Company and the Restaurant Keepers' Association.

Briefly summarized (from the dictated statement of Edgar L. Masters, attorney for the unions) the bill filed by the Henrici Company charged the above unions with a conspiracy (the stock charge in such cases) to injure the business of the Philip Henrici Company, and prayed that they be enjoined from picketing, distributing literature—particularly the *Bakers' Journal*—and using such phrases as, "We want \$8 for six days' work" and "there is a strike on at Henrici's."

The cross bill, filed at the same time, made defendants the Henrici Company, its manager, and an organization known as "the Restaurant Keepers' Association" (being the employers' union) and the members of the latter, charging them with conspiracy to injure the business of the waitresses and of their unions, and to wreck the said unions and to prevent the said unions from increasing their membership and widening their influence in the economic world; and set up that the Restaurant Keepers' Association was "picketing" by means of inserting advertisements in the newspapers, tending to corrupt public opinion and prejudice the public

against the unions, and praying that the said Henrici Company and its manager, and the Restaurant Keepers' Association, be enjoined from prosecuting said conspiracy. The claim was set aside by the court.

In this hearing, which consumed two weeks, the entire case (and, indeed, much more) was on trial, all the important witnesses and parties concerned having been put upon the stand. Only the merest fraction, editorially sifted, of this most significant testimony ever reached the public.

Undoubtedly, anyone in sympathy with the trade union position would be glad to have the evidence in this case spread out, in its entirety, to public access.

The trial ended on March 19. At the opening of the case the judges directed that there should be no picketing, pending a decision. They also directed that there should be no arrest of pickets. The unions conformed; the Henrici Company resumed its "picketing" advertisements in the daily press.

After two weeks the judges handed in a decision which to the average lay interpreter seems to forbid "peaceable picketing" by the spoken word as "tending to intimidate" those addressed—at least in the vicinity of the Henrici restaurant; but, on the other hand, refused to "enjoin the defendants from printing or publishing printed matter of any kind, calling attention to the fact that the business of said company is not unionized, or that a strike is on at its said place of business, or that it is unfair to labor, etc."

The unions conformed as before and proceeded to get out their printed statements and distribute them at the railway stations. One arrest was made of an official of the Waitresses' Union who submitted peaceably but warned the arresting officer and the booking station that she would prosecute. She was not booked. The waitresses are also employing the method of slides at nickel theaters to make their strike statements.

An interesting sequel is now being enacted in the strike of all the George Knab restaurants in the loop district, nine in number. Knab refused to renew his contract with the unions in order to become a member of the Chicago Restaurant Keepers' Association. Picketing is being silently conducted before these restaurants by means of cards carried in the hands or pinned upon the hats or clothing of the pickets. These cards announce "Strike of cooks, waitresses, bakers and waiters at Knab's. Don't be a strike-breaker." Or sometimes merely "Don't be a scab."

It would seem that the recent conflict for freedom of speech and action had not been in vain, for only two arrests have so far been made in this strike; one of a waitress accused of distributing printed matter and one of a cook who was arraigned before Judge Stewart. This judge discharged the man and instructed the police that he wished no more such arrests made. The strike seems now to have a chance of fair play.

BRITISH EXPERIENCE WITH AN 8-HOUR DAY IN THE STEEL TRADE—BY JOHN HODGE

SECRETARY, BRITISH STEEL SMELTERS, MILL IRON AND TINPLATE ASSOCIATION

The secretary of the strongest and most intelligently conducted organization of steel workers in the world tells some of the reasons for adopting the eight-hour day in England and discusses the practical results that have followed where it has been put into operation. Mr. Hodge is a labor member of Parliament, and a member of the Industrial Council, over which Sir George Askwith, secretary of the Board of Trade, presides.

For editorial comment on recent developments in the United States see page 223.—Ed.

Those familiar with the atmosphere of steel works, know that the great heat, the dust, the noise of machinery, the extremely exhausting nature of much of the labor, the constant dread of a death-dealing slip in handling the great mass of molten metal, and the constant strain on the mind, all have their effect upon the physique of the workmen. As a result of these conditions, coupled with long hours, men have had to stop work at an age which in less strenuous callings would be regarded as the prime of life, and one looks in vain for old men working on the furnaces.

Moreover, after working twelve hours a day under such conditions, what chance has a man, wearied in body and mind, to interest himself in mental improvement, civic or religious activities, in the technique of his craft or anything else? He becomes a beast of burden and nothing more.

An eight-hour day for the worker affords some time for recreation, for mental cultivation, for civic duties, for enjoyment of home life, and opportunity of following his trade until old age permits him to relinquish his work, instead of being cast on the scrap heap at forty-five.

For the past twenty-five years there has been a continuous agitation for an eight-hour day in Great Britain, ranging from academic discussion to sustained and persistent demand. At times the workmen in individual works, incensed by what they thought was inactivity on the part of their leaders, have tried to force the issue. Their demands have subsequently been withdrawn, but their action has demonstrated to the employers that the demand for an eight-hour day is not entirely the invention of labor leaders, but that the exhausting physical labor, combined with an ever-increasing mental strain caused by speeding up and the introduction of new processes, makes it essential.

Many conferences have been held with the employers to discuss the eight-hour day. The workmen declared their willingness to divide their earnings for twenty-four hours by three instead of by two. While the steel operators did not dispute the workers' readiness to do this, they argued that if they conceded the shorter day to steel smelters, the agitation would not end there but every one else would want it too, and, as the money of these others would not divide, the

costs would be increased. To this the reply was that for sixteen years West Hartlepool steel smelters had had an eight-hour day and the other grades had never asked for it.

The first eight-hour experiment with open-hearth furnaces was at Port Clarence. The introduction of the hot metal process there made the work of so strenuous and laborious a nature that the firm became convinced of the value to them of an eight-hour day. The employers association, however, refused them permission to put the scheme into operation. The firm thereupon withdrew from the association, in order to have a free hand, and the plan was arranged.

The higher paid workmen not only voluntarily divided their earnings, based on the tonnage of twenty-four hours, by three instead of by two, but gave a percentage from their earnings to make the wages of gas producer men and charge wheelers the same for eight as for twelve hours. The firm on their part gave the

tonnage men a bonus on any increased output. The success of the eight-hour shift here is best emphasized by the fact that the bonus has more than recouped the men for the percentage they gave to the lower paid classes of labor.

Since this experiment, the employers association has permitted the Hawarden Bridge Works and Bolckow, Vaughan & Co. to put the eight-hour tour into operation. Now that the objections have to some extent been removed, greater progress is hoped for.

At the Hawarden Bridge Works, a firm rolling sheets for the corrugated sheet trade, the mills used to be operated on the twelve-hour system, the rollermen being in the position of contractors. The Steel Smelters' Association was instrumental in having the contract system abolished and an eight-hour shift established. The dual change resulted in greater output in eight hours than under the old twelve-hour plan. The firm then naturally came to favor the eight-hour shift in smelting shops and bar mills.

In South Wales the eight-hour shift is almost universal in smelting shops and bar mills, the change being made with beneficial results. So far as the smelters union has been able to collate figures, they show an increase in the average output of 12½ per cent in smelting shops and 22½ per cent in bar mills.

The greatest difference, however, is in the general health and habits of the workers—a change in some instances bordering on the miraculous. As one employer tersely put it, "It has made bad men good and good men better."

AFTERMATH OF INDUSTRIAL WAR AT IPSWICH, MASS.—BY EDGAR FLETCHER ALLEN

It is fairly easy to get the story of a strike in process. Dispassionate after-analysis is less common. In this article the minister of South Church, Ipswich, Mass., who was a member of the Citizens' Committee on arbitration during the strike a year ago and secretary of the committee on the Fourth of July celebration, discusses some of the things that Ipswich people learned from it. It was said the strike was lost. Here it is suggested that something was gained.—Ed.

There are times when advancement and liberty can be won only at the cost of revolution. Devastation alone could have won the desired liberty for Israelitish slaves under Pharaoh. The Egyptians had to be taught by a "strong hand," and the world has had to move from entrenched privilege to a nearer approach to equity by the same means throughout its history. This need not be so, it merely is so. We take thought after revolution.

Almost a year ago, the little town of Ipswich, Mass., was terrorized by one of the great chain of I. W. W. strikes which spread through the textile industry of the country. The crisis came in May, and the strike lasted through the spring and summer, costing one human life, several broken heads and minor wounds, the invasion of the town

by an armed force of police who were necessary to safeguard property and preserve the peace, a depression in general trade which cannot well be estimated, an enormous increase in the tax rate, poverty among the laborers and their families, a perpetual sitting of the district court, prison sentences for the strike leaders, a general estrangement and misunderstanding between the townspeople and the alien population, with the ultimate defeat of the strikers.

The strike was called before any real statement was made of the grievance, and when demands were ultimately made, the cause seemed to be an invention. In one room of the mill, a new product was being made, which could not be turned out in such large numbers as the old style, and would have

worked some hardship if the same rate had prevailed. The price of this work, however, was advanced, which would have evened up wages, and so removed contention. In addition, there was a rather indefinite complaint against the dismissal of an inefficient worker. The basis of the complaint does not seem clear yet.

Early in the disturbance a citizens' committee was formed of representative people of all shades of sympathy, who in a fair investigation sought the truth of the situation. It was impossible to get a definite understanding. The writer was among the strikers several days after the real trouble commenced, and tried to find what demands the strikers had. The invariable reply was "40 per cent."

The strike has two distinct periods. The first was the brief period when the citizens' committee hoped for arbitration and tried their utmost to obtain it, while the strike was being led by local leaders. It was the local leader who replied to the writer that the demands were "40 per cent." The strikers failed to make a great impression under this leadership, their funds began to diminish, and the mills opened with a short-handed staff, but able to keep going. This opened the second period, under I. W. W. leaders, and resulted in bloodshed and riot.

Some of the I. W. W. leaders in speeches advanced arguments against American institutions, following the example of the agitation in Lawrence. This led to the establishment of another citizens' committee, directed not against the strikers, but for American institutions. The newspaper reports, called them "vigilantes" and stated that they had power to ride the strike leaders out of town, and to put an end to the strike by summary violence. This was simply newspaper sensationalism. The only duty of the committee was to arrange for a Fourth of July celebration, when the flag should be much in evidence, and an effort made to stir up enthusiasm for American institutions.

The mill continued operations, and slowly the strikers added to the working force, and the strike died for lack of interest and funds.

In the trials resulting from the riot one girl was questioned concerning her wages, and replied that she received \$2.50 per week as an average. On investigation it was found that she had never received less than \$5 per week. Recalled by the judge and questioned as to her previous testimony, she replied that her pay envelope was given unopened to her father, and that he told her she got \$2.50.

The matter of wages ought to be carefully considered. The working class needs more income, it is true, but such misrepresentation is unfair. Probably, however, it is no more unfair than the average wage in the textile industry.

Previous to the strike, a survey of the town had revealed serious housing defects among the laboring classes.

These defects, so far as they were merely structural, have in a large measure been modified, but there is still remaining much of the voluntary overcrowding, misspelled economy, among the workers.

But as we look back, what was the cause of the strike? What did it accomplish? Who won?

Close touch with the operatives has left the definite impression that one of the fundamental causes of industrial disturbance of this kind is a disappointed idealism.

The immigrant who finds employment in the textile industry is, generally speaking, from the undeveloped races. He has entered into a great idealism which he cannot understand. The tale of the past for him is a tale of oppression. In his despair America is the promised land, flowing with milk and honey. So he comes, only to find that he has changed his country but not his fortunes, and if he would get ahead, it must be by long and arduous work, and rigid economy.

In the immigrant, from whom direct oppression has been removed by his journey, in whom ambition is hopeful and liberty no distant dream, the past has to be fought anew. His idealism needs direction, and he has not received the necessary illumination. And it is unfair to expect a fine expression of idealism from the recently emancipated. The expression of desire that is in them must be crude. In truth, the desire itself can only be half formulated.

The immigrant has no direction, he only knows he wants something he has not got. He takes his immediate ideal from his oppressors. They have something denied to him. It must be worth having, for it has been closely guarded. It is desirable—therefore, get it!

The laborer suffers keenly from the utterly impersonal relationship between employers and employed—especially where the employer is an absentee owner. So long as industry is viewed entirely from a dividend standpoint, we may expect strife of increasing dimensions and bitterness. The syndicalist spoils the product, absenteeism spoils the producer. Where is the fault?

Closely linked with this difficulty is the terrible importance of money. The laborer sees his children sickly and feels the pinch of want. Only money can buy health. He feels the right to more money, for money means health, and happiness, and life. He cannot get a hearing as an individual, but in collective bargaining he has a weapon ready to his hand. He welcomes it. He ought to welcome it.

The real victory of the strike lies in our understanding of the striker. Whereas before the strike, and during the period of its bitter warfare, one could hear foolish threats, and opinions "that the immigrants were little better than beasts," the feeling is now one of sympathy and appreciation. The town, in a year when the tax rate had risen \$7 per thousand, voted an appropriation for evening schools throughout the winter, and at the town-meeting in March of this year unanimously voted sufficient

funds to carry the school through another winter. The school sessions have an average attendance of almost 300 foreign people, eager to learn English.

The people are beginning to understand responsibility for the stranger. When the matter is carried to a fine point, there is no American after all. We are English, or German, members of one nation or another, prior merely in point of time as immigrants to a new country.

If it be desirable to escape such leaders as have offered themselves to the immigrant, and have shown themselves accepted leaders, the Americans of longer standing and perhaps higher education and idealism must buckle down to leadership themselves. Before we can expect the newcomers to respect American institutions we shall have to respect them ourselves.

The immigrant does not need sentimentalism. He does need education in the value of law and authority; not in their austerity,—in that he is well versed,—but in their protection. He needs to see that we are all fighting a world problem, and that his part of it is not separate from the whole.

This we need to understand and to make clear to the immigrant laborer. It is natural that he should be of the opinion that all will be solved when he has a little more money because the immediate need usually looms largest. He must be shown that there is a higher need than money, that there is a civic duty. In the heat of agitation it is easy for the striker to lose sight of the need of order. The time to kill a strike is before it commences.

The sound wisdom of this is being realized in Ipswich. Those who less than a year ago were wild strikers, with only one idea, are rapidly being molded into thoughtful and understanding citizens. This does not mean that all possibility of strike in the textile industry will be so eliminated. On the other hand, it may work in exactly the opposite direction. With civic education, an understanding of the law and fundamental human rights and an increasing realization of certain common forms of injustice prevalent in the social system, we cannot expect long periods of peace. At the present time the strike is the only weapon of the laborer. It may only be brandished, and lowered by reason of arbitration, or it may be used in compulsory betterment of conditions.

This is another gain: there is a more general understanding and appreciation of the strike, as well as of the strikers. The citizens realize that it is legitimate, and while they may deplore its existence, and do all they can to bring it to an end by fair means—it must be recognized.

Some day, perhaps, we may live in a world which is free from strikes and social injustice—they will disappear by mutual consent. Meanwhile, we have the aftermath of industrial war, and in the case of Ipswich at least, it means that the immigrant laborer is being treated as a human being.

CHURCH and COMMUNITY

Edited by GRAHAM TAYLOR

THE CHURCH AND PHILANTHROPIC ORGANIZATIONS—BY ALLAN CONANT FERRIN

A FEW WEEKS ago the writer of this paper, who is pastor of a church of about two hundred members in a city of one hundred thousand population, sent out to his parishioners the following letter of inquiry:

"Your pastor desires to take an inventory of stock. He wants to know what Church is doing for the Kingdom of God. Sometimes it is charged against the church that it is too much engrossed in its own individual life. Is this true? Is it true of our own church? This is what I desire to know, and to let the church know. So I am asking you to help me find out.

"Please indicate in the blank spaces on the next page what charitable and philanthropic organizations, aside from the church (such as the Y. M. C. A., boys' club, etc.) you are interested in as a worker—as officer, member of committee, director, occasional or regular helper.

"Will you also please indicate, as requested, to how many of such organizations you are a regular contributor, and, if you are willing, what is the total amount of your annual contributions? Your replies to these questions will, of course, be held in strict confidence."

The questions, as formulated, were these:

"1. What charitable and philanthropic organizations, aside from the church, are you interested in as a worker?

"2. To how many such organizations are you a regular contributor?

"3. What is the total amount of your annual contributions?"

One hundred and twenty-five letters were sent out, from which were received 82 individual replies, though not all answered all three of the questions. Some reported not being able to name the total amount contributed because of failure to keep a record, and others evidently were unwilling to disclose their gifts, several of whom the writer knows are generous givers. Still others seem to have thought their gifts too small to be reported, not appreciating that the end desired in the inquiry was the aggregate amount contributed by all donors. So, too, from those who did not reply at all the writer could, from his personal knowledge, have raised the total in the answers to all three questions by a considerable figure.

It should be remarked also that what is called "private charity" was not included in the inquiry, and a few instances in which this exclusion was disregarded in the replies received are eliminated from the summing up of the results. The missionary gifts through the channel of

the church are likewise excluded, as well as activity within the several departments of the church.

Of the 82 responding to the questions, 34 reported themselves as being regular or occasional workers, and in 24 different organizations. A goodly number of these reported as each being regular or occasional workers in several different organizations—from 2 to 6. As confirming the results of his inquiry on this point, the writer was interested, in looking over the list of names on teams organized to conduct a more recent cam-

THANKS BEFORE MEAT

AT GATHERINGS OF SOCIAL WORKERS

To A. K. A. by M. M. D.

THANK God for the hunger of our bodies that makes us all one in our human need. Thank God for the kindly service that meets our need today and for the dear companionship we enjoy. Thank God for the hunger of the soul that seeks its own through distances close and wide. Thank God for the revelation of the Great Companion and of the supreme companionship that comes through seeking and service for one's own.

paign to raise funds for a local charity, to note that 13 out of a total of 101 were of those to whom he had sent his inquiry, and also that almost without exception the members of the teams were well-known adherents of the Protestant churches of the city.

Fifty-eight of the 82 replying to the questions reported themselves to be regular contributors to charitable and philanthropic organizations, a trifle over 70 per cent. The total number of organizations contributed to was 34, a few of which are outside of the city. The number of persons contributing to more than one organization was 31; to more than 5 organizations, 10; to more than 10, 4.

The total amount of money contributed annually was reported at \$2,167, the larger part of which, of course, was

given by a comparatively few people. But there is no question whatever in the writer's mind that if a few known to him to be generous givers and many other small givers, who declined to report their gifts for one reason or another, had not done so, the total would have been materially increased, perhaps even doubled.

However, taking the returns as reported, without any suppositions, enough facts were gathered to indicate without question the relation of one church to the work of organized benevolence in the modern world. And what is true of this one church is, in all probability, in general true of the other congregations in the community and the church as a whole. This particular church is what is known as a family church, though located on the fringe of the down-town district, and without material equipment for so-called "institutional" work. It is not a wealthy church, although having a few families who, if the standard is not fixed high, would be rated as possessed of considerable wealth. On the other hand, it has but few poor, that is, dependents.

The annual budget of the church for current expenses is about \$5,000. The city in which it is located is a manufacturing city, with 75 per cent at least of the population foreign by birth and a large portion of this of the more recent immigrants. The Protestant population has been steadily decreasing for several years, and without any decrease in the number of Protestant churches. Within the past four years a new Young Men's Christian Association building has been erected at a cost of \$250,000 and a new home for the Boys' Club secured at the cost of \$20,000. Just now, too, a campaign is on to raise \$10,000 for the Young Women's Christian Association.

But even more significant as showing the dependence of philanthropic organizations upon the churches than the money contributions is the number of active workers furnished by the church in question—34 out of a total of 82 reporting, 70 per cent. The writer has every reason to believe that this percentage would hold good for the entire membership of the parish.

In order to visualize the relation between the church and organized charity work outside the church, two charts were presented showing at a glance the financial relation and the personal relation—its money gifts and its gifts of workers. At the hubs of the two wheels is the church, on the circumferences are the several organizations to which it contributes money and service, the spokes marking the connection, or lines of radiation from the church.

A study of these charts discloses very

quickly both how largely the church is finding expression for its faith and religious convictions in practical community betterment, aside from its value as an indirect inspirational force, and as an institution for maintaining the high ideals of the Christian religion. The value of these organizations to the church is immeasurable, as furnishing opportunity for the expression of its spiritual life in concrete practical form, for putting into practice and reaping its self-developing results, the fundamental pedagogical principle, "No impression without expression." Erase the spokes of the wheels, and one readily sees how at a loss the average church would be, with its utterly inadequate equipment for doing Christian service in the community as such service is now conceived, without these outside organizations.

It is sometimes contended that the churches have made a serious mistake in permitting all this work to slip out of their hands, that had they realized their indebtedness to the community and understood the Gospel there need never have been such a multiplication of outside institutions doing Christian service. Possibly it may have been a mistake, but the mistake has been made and cannot be recovered.

As a matter of fact, has the church after all let these opportunities to serve slip out of it hands? It is true that the individual church is submerged in the co-operative activities of the many churches in these institutions, but the question at once arises as to the greater efficiency of such co-operative service. Certainly the effect has been to lower denominational barriers and develop the fraternal spirit. And then it is very doubtful if the non-church elements in the community could be induced to assist to the extent they do, if the work was carried on in sections by individual churches, instead of through co-operation. No doubt, the churches have not received the credit they deserved, and sometimes there has been manifest in these outside organizations, like the Young Men's Christian Association and social settlements, a spirit of independence of the church, even of dictation to the church, which was not justified either by the facts or by a proper understanding of the problem of social uplift. But of late there is evident a change of sentiment on the part of social workers in the above-mentioned organizations and others, involving a more generous recognition of the necessity of the church.

As Robert A. Woods, of South End House in Boston, has been recently quoted as saying, "We have come to see the inadequacy of all other forces in the community apart from the added influence of the church. That the home alone cannot solve our many problems; that the schools alone cannot do it; and that those in the homes and in the schools are looking as never before for the co-operative service of the church. All the social workers are coming to see that this world is not saved by education. The tide of interest and desire is flowing back into the church."

Winston Churchill, in his novel, *The Inside of the Cup*, has emphasized the same thought in one of those dramatic

interviews between John Hodder and his wealthy parishioner, when the new settlement house was under discussion.

Now, on the other hand, suppose that the center of the circle, the hub of the wheel, should be erased, what would become of the many outside organizations? Where would they get their funds? Where would they get their workers, even ultimately their paid workers? The fountain of the many streams flowing into their treasuries and activities is dried up—not of all the streams, of course, but the great majority of them.

If the church is neglected, if it is given a secondary place in the interest of the people, if it is deprived of adequate funds and workers so as to weaken its efficiency, if the burden of its support and activities is thrown upon the shoulders of a few loyal ones till they get wearied of the overload, what is the result? The richest mine from which these other institutions draw their workers is taken away, or greatly exhausted. They are cut off from their surest base of financial supplies. They are deprived of the chief source of their inspiration.

WITH HALF A LUNG: THE STORY OF A COMMUNITY PREACHER—BY FRED EASTMAN

A LITTLE MORE than a year ago a Methodist preacher with only half a lung went from New York city to a small farming community near Suffern, N. Y. His name was John S. Burton. He was assigned to three tiny churches on a circuit. His salary was microscopic. It was not sufficient to support his wife and three children in even the simplest sort of Methodist minister style. It had to be helped out by gifts of potatoes and beans, turnips and corn and whatever else the neighbors saw fit to bring in.

He went into the community with the expectation of dying there, and that before long. But as he got acquainted with the place (or the places rather, for his churches were miles apart), he found work that needed to be done before he died. Here were farmers thirty miles from New York city each living to himself and each competing with his neighbor farmers in marketing his products. The young men were leaving the farms as fast as they could go. Life in the country seemed too slow, too dull and too unpromising. The only place to have any fun at all seemed to be the small city four miles away.

Now the little Methodist preacher thought that these things ought not be. Farmers had as good stuff in them as other people and life in the country he thought could be made just as attractive as life in the city, yes, even more so. The one problem was to get the farmers to work together. And that's about the hardest problem under the sun. Farmers don't want to work together. All their life in the open on their farms teaches them only how to work independently. The farmer's boast is his independence. He's proud of what he does by himself, not what

And, what is more fundamentally important, they will lose a certain quality of service, essential to all permanent social uplift, the need of which is now conceded—that which comes from a well developed religious nature and the passion for human souls.

We may not see or feel the effect of these losses in our day, but future generations—even the next generation—will feel them deeply, and charge them to the folly of the Christian people of our generation.

The writer's attention has been called to the fact that in recent years many of the humanitarian functions hitherto regarded as the prerogatives of the church and other voluntary agencies are being rapidly taken over by the state, the city and the county. The fact adds emphasis to the value and importance of this little survey. It is indeed one of the most significant facts in modern social development, and is at once a reply to those who are inclined to criticize the church as an ineffective agency and also a further appeal for an even more loyal support of the church.

he does together with his neighbors.

The little Methodist preacher set about to bring these farmers together—to make them learn to work and play together.

He needed a horse and buggy. He had only \$50 in cash and he knew he couldn't get much of a horse for \$50. But he announced that he wanted to buy a horse and was willing to pay \$50. Immediately all the horse traders of the country round began to come to him. They brought the lame, the halt and the blind, as miscellaneous a collection of horseflesh as ever passed under that name in that neighborhood.

Now the Methodist preacher knew nothing about horses and could not tell a good one from a bad one. So he resorted to prayer. Every time a horse was brought to him he would say, "Lord, is this the horse I want?" And the Lord replied (according to the preacher), "No, not this one." Sixteen or seventeen horses were brought to him and the Lord turned them all down.

Then one day the preacher called at a large farm to ask the owner to come to church. The owner was not a church-going man and he said afterward that he had a strong inclination to turn the hose upon the preacher. But he made a great show of being courteous.

"It's a hard job you have here," he said by way of starting conversation.

"Yes," said the preacher, "but it isn't a hopeless job. If I can get one or two young men turned around and started on a life of decency and good citizenship I'll call my work a success."

That appealed to the farmer. When the preacher left the house that afternoon the farmer called up a few of his neighbors and got them to subscribe

enough to buy a good horse and buggy for the parson.

And then the parson went to work in earnest. Last fall, just a year after he settled down in the community, a club flourished among the farmers. It had 300 members. In September they gave a country fair. There were exhibitions of farming and garden products; there was a plowing contest and a flower show; there were exhibitions of cooking and of industrial work, and there were athletic contests winding up with a ball game. The fair was held at one of the farms and the whole neighborhood was there. The stores in the small city of Suffern four miles away closed their doors on Saturday from 10 o'clock in the morning to 5 in the afternoon in order that their employes might go out into the country to attend the fair.

THE SOCIAL SERVICE CHURCH UNION: ITS OBJECTS —BY ANNIE T. MOCK

ONE OF THE principal objections to organized charity is that it is said to rob charity of its sympathetic and personal elements. The Indianapolis Charity Organization Society has been attempting since its beginning to combat these objections. In the recent organization of the Social Service Church Union, an important step has been taken in bringing the personal element more strongly into the work than ever before.

The Social Service Church Union has two important objects; to bring the churches into active co-operation with the charitable forces, and to extend the right influences into every section of the city. The work done in a few months gives hope that it will be successful.

The plan of organizing churches for social service work has been tried in many cities and in some has proven unsuccessful. An attempt has been made in Indianapolis to study the work in other cities to see wherein it has failed. In several places it has been found that no definite plan of work was laid out, and the organizations died from inaction.

In perfecting the organization here, all publicity was avoided, and the work was thoroughly outlined before any churches were approached. Then when ministers and laymen in the churches were asked to take part in the organization, a definite work was offered them.

The Social Service Church Union is not a distinctive organization, but is an organization to supplement and extend the work of the Charity Organization Society. When the latter finds a family in need, one of its trained investigators makes an investigation, and provides for immediate needs. Then the Social Service Church Union is called into action.

Under the plan of organization there is a strong executive committee composed of nine persons who direct the work. There are four departments each of which has a committee of five to outline its work. A committee of five is obtained from each church, three men and two women (the women for friendly visiting). A worker for each

After the fair one of the farmers in the community, a Roman Catholic, offered to give one of the houses on his farm rent-free as a club house for the community club.

The club has a dozen or more committees, an educational committee, a better farming committee, a lecture course committee, etc. Some of the neighborhood's business men who live in the city in the winter have become so interested in it that one night a week they came out from the city especially to attend the meeting of this club.

This little Methodist preacher is on no committee; he is not chairman or secretary or treasurer. He is just a sort of two-legged prayer meeting going about the community filling everybody full of the holy spirit.

church organized is placed in each department. The departments are for relief work, for the study of crime and its causes, for housing and sanitation investigation and for friendly visiting.

If the family needs continual relief because of ill health, a large number of children or from some other cause, the relief department is asked to take up the work. An effort is made to find the relatives or friends who will contribute to the family's relief, and the proper kind of relief is found and provided.

Often the bread-winner is a drunkard, or will not work, or spends his money for various purposes. The department on crime is immediately called and a thorough investigation is made. Perhaps the courts are appealed to, but more frequently the influence of upright men who show an interest in the man or woman, is sufficient to restore the man or woman to normal conditions.

The housing and sanitation department co-operates with the City Board of Health and the municipal building inspection department. When a family is found where unsanitary conditions make for sickness, workers in the housing and sanitation department investigate conditions thoroughly. The owners of the property first are appealed to to remedy conditions and if they fail, the city government is requested to act.

Not the least important is the friendly visiting department, composed entirely of women. Frequently workers of the Charity Organization Society find families living in bad conditions because of incompetent mothers. After the mother has been a working girl before her marriage and has had no opportunity to learn to cook, to keep house, and to care for her children.

A friendly visitor is assigned to this family. She approaches in a diplomatic way and soon wins her way into the home. There she instructs the mother in the duties of her household, and is indeed a friend. In this way the problems of a family are worked out along scientific lines.

Seventy-eight churches, including

Protestant, Catholic, Jewish and Unitarian have joined in the work, making a total of nearly 300 laymen engaged in social work in this one organization. Practically all of them are busy, and at stated intervals meetings are held at which the workers exchange experiences and views. It has been found that when laymen are once started in the work, it is easy to keep them engaged, as they find it very fascinating.

FIRESIDE TALKS AFTER EVENING SERVICE

Rev. Leslie E. Learned, rector of All Saints Episcopal Church of Pasadena, Cal., has found a new method of creating interest among thoughtful people in applied Christianity.

He recently announced a series of fireside talks at the Parish House after the Sunday evening service, with subjects suggested by some article in current literature among which was Consider the Other Fellow by Colonel Higginson in THE SURVEY of February 7. Other topics were immigration and the work done in assimilating our immigrants by the public schools. The attendance was usually large, other churches being well represented.

Sometimes a leader was appointed to open the discussion, sometimes not. There was full and free expression of opinion encouraged and guided by the genial rector who though plainly an idealist evidently desires ideals to be wrought into the fabric of our common life, and always he dismissed the gathering with an uplifting and hopeful sentiment.

WOMEN AND CHURCH FEDERATION

In the discussions of the Conference of New England Church Federations recently an entirely new feature was developed, woman's part in the movement. Mrs. George W. Coleman told how, since 1900, the women's missionary boards of the leading denominations, both home and foreign, have been federated for mission-study institutes and text-books.

Mrs. Georgia M. Root described what is probably the first attempt of church women to unite forces, something that club women have done for two decades. She told of the Providence Federation of Women's Church Societies, including forty-three churches of eight denominations. Started to give a reception to the pastors of the city, it soon found a field of its own in affording a clearing-house for experience in the best methods of women's church work, in united study and prayer for missions; and in bringing church women for the first time into alliance with social service workers.

A "forward movement" mass-meeting of a thousand women, after an inspirational address, listened to the definite suggestions of a dozen of these social experts. The opportunities of woman as secretary of a local federation were forcibly illustrated from her own experience by Harriet J. Stevenson of Portland, Me. Every pastor present felt, as one remarked, "That is just the help we all need in our own city!"

The Trend of Things

CLINIC NOTES is a new publication, modest in dimensions but wide in aim. Its four pages are issued by the New York Association of Tuberculosis Clinics "for the information of clinic physicians and nurses." The title suggests case records but the information offered has to do rather with doings and suggestions in the general field of tuberculosis work and study. Among the items in the May issue is a summary of the recent investigation made by the Free Synagogue and the United Hebrew Charities into the condition of patients discharged from sanatoria.

The American

RAY STANNARD BAKER in the *American*—A Thinker in the White House—gives the following principles that are being set up by President Wilson:

First.—Some of the power and some of the privilege of vast wealth are being curtailed. The tariff law, the currency law, and the trust laws have each tended in this direction.

Second.—The principle of government control of industry and commerce has been established as never before. Commissions provided for in the currency and the trust legislation have this end plainly in view.

Third.—A short step in the direction of actual government ownership of the instruments of commerce has been made in the provision for the governmental development of Alaska railroads, the control of radium lands, and the like.

Fourth.—And in some ways the most important of all, a new ideal, a new standard is being set up in our relations with our neighboring nations—as in the Mexican affair.

THE WORLD'S WORK

THE public defender has become an officer of the courts in Los Angeles county. The incumbent, Walton J. Wood, obtained the position by a civil service examination in which he stood highest among fifty candidates. During the first month (January) nearly a thousand applicants brought their cases to the new office. More than half of the applicants were found to be deserving but so poor that they were unable to hire an attorney. In most of the civil cases the public defender, with the prestige of his office, has been able to settle the cases out of court.

Says the *World's Work*

A poor man accused of a crime whose case reaches the Superior Court can call upon the lawyer who fills this recently invented office. Elsewhere in the United States the court appoints a lawyer to represent defendants who cannot hire their own counsel. In some cases able

counsel are appointed. In other cases they are not. In Los Angeles County the poor defendants have a county officer to defend them just as they have a county officer to prosecute them. . . .

Besides the criminal cases of poor in the Superior Court, the public defender takes civil cases in which the defendants seem unduly harassed by creditors. He is also empowered to institute civil suits to collect debts of less than \$100 for the indigent. This enables him to collect workmen's wages for them, which they are more or less powerless to collect for themselves because of the cost of litigation.

ATLANTIC MONTHLY

THERE is a new stressing of values in Prof. George C. Whipple's article in the May *Atlantic*, on the Science of Public Health. Long-cherished bugaboos, like sewer-gas and the passage of disease germs through the air, are disposed of, and new theories of air and water and the things in them both, are offered for consideration and attainment.

"Broadly defined," says Professor Whipple, "sanitation covers all the arts which make for clean environment, and sanitary engineers concern themselves not alone with drains and sewers and sewage-treatment works, but with all of the many activities required to provide communities with pure water, fresh air, clean food, and, in general, clean surroundings."

In pursuit of clean air we find that ventilation now depends no longer on carbonic acid alone, but on humidity and air movement. Proof of this is found in experiments made in close chambers known as calorimeters. Persons remaining in this calorimeter until concentrations of carbonic acid far exceeded those in crowded rooms, experienced no discomfort. When temperature and humidity increased and the air was kept motionless, they began to suffer. Air-washing has been successfully attempted at Springfield, Mass., in the gymnasium of the College of the Young Men's Christian Association. The air is driven through chambers where water is falling in drops or as a spray, and the result is as "freshening as a summer shower."

"The air in the exhaust-duct always had a noticeable odor when the men were exercising on the floor, but after being washed the air was returned with no offensive smell. Examination of the water used for washing the air showed that the odoriferous substances had gone into the water, together with dust particles, bacteria, and even epithelial scales from the skin. If the washer was shut down and the air recirculated the men complained of foul air. Starting the washer restored comfort."

A saving of heat is, obviously though with limitations, possible by this method of ventilation.

In the matter of water, filtration, by passing the water through layers of sand, is still the chief process of purification employed, but the use of chemicals Professor Whipple believes to be rapidly increasing. Some recent studies have emphasized the practical importance of temperature, (e. g., the typhoid bacillus lives in cold water, dies in warm), and of microscopic algae floating in the waters of lakes. An interesting effort on the part of nature to assist in solving problems of sewage disposal is told in the following paragraph:

"The cycle of changes in the microscopic life in polluted water is curious and interesting. Studies of the Genesee River, between the mouth of the Rochester sewers and Lake Ontario, made last year, showed that just below the point where the sewage was discharged the water contained large numbers of bacteria; a few miles downstream these decreased and the protozoa increased; next the protozoa decreased and the crustacea increased. The crustacea serve as food for fish, and fishermen were actually seen at the river mouth catching fish to be taken back to Rochester and used for food. Hence the cycle was complete. This is an excellent illustration of what is ever recurring in nature."

Perhaps even more significant than Professor Whipple's narration of these special discoveries, is his generalization as to the interrelation of the problems outlined:

"The street-cleaning problem, the garbage and refuse problem, the housing problem, the factory problem, are in the same class with the ventilation problem and the sewage-disposal problem; and the list might be extended further." "A study of sanitation leads to a study of sociology."

The solution, he believes, of these inter-related problems demands the application of "vital bookkeeping"—the term he applies to demography or vital and social statistics. He calls for co-operation at every point with the efforts of the Census Bureau and the Children's Bureau to secure adequate registration laws the country over and the efforts of certain life insurance companies to make statistics more than a house of cards, and to render them accessible to students of modern life-saving the country over.

The conclusion of the whole matter is that this broadening science of sanitation calls for broader men, men of sound fundamental education, men of imagination, men of force. The new career of the new type of health officer is appealing to strong and thoughtful recruits at such training places as the School for Health Officers in Boston. "The need of reliable men is not confined to the leaders of thought," says Dr. Whipple. "The shame of American sanitation today is neglect of duty, non-enforcement of laws. Legislators do not legislate with wisdom, inspectors do not inspect, attendants do not attend, and laborers do not labor as they should."

THE Fish Committee was a committee of stockholders of high standing of the United States Steel Corporation, with the former president of the Illinois Central Railway as chairman. It was appointed to inquire into labor conditions under a resolution adopted at the annual meeting of the corporation in 1911 and it reported in 1912.

The Finance Committee is the highest legislative-administrative board in the make-up of the United States Steel Corporation.

The United States Steel Corporation is the largest employer of labor in the United States.

The annual meeting of the United States Steel Corporation for 1914 (held in April) was significant because of the apparent disposition to consider all obligations met by a record of 33 1-3 per cent performance of the recommendations made by the Fish Committee.

IT will be remembered that three important recommendations were made by the Fish Committee:

- That seven-day labor be eliminated;
- That steps be taken immediately looking to a solution of the twelve-hour-day problem;
- That reports on labor conditions in the corporation's mills be made "at stated periods" to the stockholders.

The first recommendation was immediately put into effect by the officials of the corporation.

The other two recommendations have not fared so well. The Finance Committee reported at this year's meeting that the distribution to stockholders of quarterly bulletins containing information regarding labor conditions would cost \$40,000 and be unjustifiable. Of course, there is no reason why such bulletins should be published quarterly. Everything of essential importance could be bound in with the financial statements in the annual report now sent to all stockholders. This could be done at a trifling increase in expense, and the significance of keeping the great body of stockholders acquainted with the work-conditions in the properties they own, is not to be over-rated.

More important, however, is the relegation to the scrapheap of the proposal to cut down the twelve-hour day in the continuous processes (where the twenty-four hours must be split into three parts or two).

The Finance Committee's report pointed out that when the corporation stopped the practice of requiring seven-day labor and consequently cut

off one day's pay a week from the men who had been working seven days, they lost some 4,000 men who went to other companies where seven day work continued.

The report expressed the belief that, if the reduction from twelve hours to eight were made without increasing the hourly rate of pay, dissatisfaction would be much greater than that which developed in connection with the seven-day week. But if, on the other hand, the corporation should so increase wages as to enable the men in the continuous processes to earn as much as formerly,—in other words, increase the hourly rate 50 per cent.,—it would then be handicapped very seriously in its attempt to compete with other concerns both at home and abroad where the twelve-hour day is the rule.

The statement is made that the question has been investigated and that the difficulties involved in changing from twelve hours to eight in the continuous processes are altogether too great. And there apparently the matter is to be left.

That the difficulties are grave no one who is willing to give the matter a moment's serious consideration will deny. Whether or not difficulties are to be faced, however, always depends in large degree upon either the advantages to be gained or the evils to be avoided by surmounting them. Back of the difficulties in this case is a regime of labor of which the Fish Committee said:

"We are of the opinion that a twelve-hour day of labor, followed continuously by any group of men for any considerable number of years means a decreasing of the efficiency and lessening of the vigor and virility of such men. The question should be considered from a social as well as a physical point of view.

"When it is remembered that twelve hours a day to the man in the mills means approximately thirteen hours away from his home and family—not for one day, but for all working days—it leaves but scant time for self-improvement, for companionship with his family, for recreation and leisure. . . .

"That steps should be taken now that shall have for their purpose and end a reasonable and just arrangement to all concerned of the problems involved in this question—that of reducing the long hours of labor—we would respectfully recommend to the intelligent and thoughtful consideration of the proper officers of the corporation."

The civilized world has practically come into agreement that a twelve-hour working day is too long. There is scarcely a steel man of standing in America who will not agree that the twelve-hour day is bad. There ought not to be any hesitancy over eliminating an evil about which there is such unanimity of opinion unless in fact such action is impossible instead of only difficult.

These difficulties are very real. In addition to those mentioned in the Finance Committee report, there is one that has been mentioned on innumerable occasions in the past, the difficulty of finding enough men when the change, requiring a 50 per cent increase in the labor force, is made. The seriousness of this difficulty is not to be questioned, for the men in the continuous processes are men of skill. However glutted the common labor market might be, men could not easily be found to do the skilled work of operating the furnaces and adjusting the rolls.

BUT no reasonable person has ever proposed making the change from twelve hours to eight over night. Throughout the steel industry of South Wales the eight-hour day has come into universal operation in the open-hearth furnaces, and, by the voluntary restraint of the union which secured the agreement with the Manufacturers' Association, five years were consumed in effecting the change. In 1907 the eight-hour shift went into effect in the first mill. Then as designated by the secretary of the union the other mills followed suit, and it was not until 1912 that the last mill of the association abandoned the twelve-hour day.

The effect of the change in Wales and the north of England is shown in the article by John Hodge, secretary of the British Steel Smelters' Union, on page 216 of this issue of *THE SURVEY*. The industry did not suffer shipwreck in South Wales. Instead the movement is gathering headway and making progress over all England.

Mr. Hodge shows how, in England, the men continued working at the old twelve-hour wage scale. Perhaps the American steel workers would not take kindly to that proposition. Perhaps it is not necessary that they should. In the absence of experiment how can we know that an increase in wages when accompanied by a reduction in hours will seriously affect costs? Labor cost at best is only one item in cost of production.

No answer has yet been made to the careful deductions of the United States Bureau of Labor Statistics on this question. In its report on the iron and steel industry it reached the conclusion that if a change were made to an eight-hour day and hourly rates were increased 50 per cent, the cost of producing a ton of pig iron would be increased only 2.6 per cent, and the cost of producing the principal products of steel works and rolling mills would be increased only 6 per cent. This estimate assumes that there would be no increase in efficiency if hours of labor were reduced. And yet all experience tends to the reasonable expectation that more and better work would be done. The Commonwealth Steel Company of Granite City, Ill., adopted an eight-hour day in

its open-hearth furnaces over two years ago, and although wages were increased the company was fully recouped by increased output.

The merits of the argument, whether based on experience, humane impulse or pure theory, seem to be in favor of the shorter work day. It is not always safe to follow impulse, but to a theory based on experience, respectful consideration cannot be denied. It is true, however, that experience as yet is limited.

In a matter of so great moment why should not the greatest employing corporation in the world, the United States Steel Corporation, carry the experiment further?

Every day in its laboratories tests are made of ductility or tensile strength of steel, of the heat units in a given amount of fuel. Sometimes a larger laboratory is needed and a new furnace is set up, or a new method of handling materials installed. Thus the department or even the plant becomes the field for experiment. Such experiments have in the past resulted in the scrapping of "anything from a steam hammer to a steel works" whenever anything better was to be found.

Thousands of dollars have been freely spent to lessen dependence on human labor. Why should the spirit of investigation stop with inanimate things? By the same methods it would be possible to determine beyond all cavil whether or not the eight-hour day is efficient or economical. A plant or a department would be needed for the test, but the game would be worth the candle. Like any other laboratory experiment it should not be terminated before it has exhausted all possibilities, nor should it be abandoned for trivial reasons. If thus entered upon in good faith a flood of light would be thrown upon this whole problem.

IT should be clear that we are not discussing the United States Steel Corporation because it has lagged behind other large steel companies in its concern for the welfare of its workmen. On the contrary, the Steel Corporation is far in advance of its contemporaries.

The outsider naturally takes with a pinch of salt the genial and in one case prayerful testimony of stock-owning employees who turned up at this annual meeting as character witnesses of the management. But the standing of the corporation rests on more substantial foundations. It pays higher wages than the other steel companies, has stood almost alone among them in the rigidity with which it has set its face against seven-day labor and is the leader of all industries in safety work.

It is exactly because of the position of the corporation as leader of a basic American industry that we believe it has no right to shift responsibilities that the logic of events have placed upon its shoulders—which in fact, by vote of the stockholders in 1912 it voluntarily assumed. The problem must be worked out. The twelve-hour day is an anachronism in the twentieth century, and in one way or another it will be abolished. It will be well if it can be done through voluntary action of the steel companies themselves. If they fail, the government will undoubtedly be forced to act, in behalf of the welfare of its citizens.

Personals

TWO remarkable things have taken place in New Rochelle, N. Y. The first was the action of the Board of Health in asking Lt.-Col. Charles E. Woodruff, M.D., who last year made New Rochelle his home, to become temporarily the city's chief health officer. The second was that Colonel Woodruff, associate editor of *American Medicine* and a sanitarian of national reputation, should have been willing to serve in this capacity.

It is seldom that a community of 30,000 is wise enough to select for public office a man who is not a native. It is still more unusual to find a man of Colonel Woodruff's ability who is ready to give his time to what would ordinarily be an unattractive position.

Colonel Woodruff enlisted in the navy as surgeon in 1886. In 1887 he entered the army and served until 1913 when he was retired as the result of illness contracted in the Philippines, where he went with the first expedition to the islands as a member of General Merritt's staff. In 1907 he served as chief sanitary health officer of the Jamestown Exposition and last year made for the United States government an investigation of sanitary work as conducted on the continent. He is the author of *Effect of Tropical Light on White Men* and of *The Expansion of the Races*.

The Health Department in New Rochelle has been under criticism for more than a year. Colonel Woodruff's predecessor was suspended pending the bringing of formal charges of neglect of duty. Shortly thereafter the New York Bureau of Municipal Research which, at the invitation of the civic sec-

tion of the Woman's Club, had conducted a survey of the city departments, made a most condemnatory report upon the work of the health bureau. New Rochellians now hope that the position of health officer will be declared vacant and that Colonel Woodruff can be induced to take the civil service examination and serve permanently in his present capacity.

KARL DE SCHWEINITZ.

IN making Bailey B. Burritt general director of the New York Association for Improving the Condition of the Poor, the directors of that organization have filled the vacancy created when John A. Kingsbury became the city's commissioner of public charities. Mr. Burritt has been acting general director since the beginning of the year.

Dr. Donald B. Armstrong, heretofore superintendent of the association's Bureau of Public Health and Hygiene, succeeds Mr. Burritt as director of the Department of Social Welfare.

Philip S. Platt, a graduate of Yale, with a special training in public health work at the Massachusetts Institute of Technology becomes superintendent of the Bureau of Public Health and Hygiene.

Mr. Burritt has been in social work since 1906, when he was appointed director of social work of the Speyer School Settlement of Columbia University. In 1908 he became assistant secretary of the State Charities Aid Association and in 1910 executive secretary of the Committee on Criminal Courts of the New York Charity Organization Society. In the summer of 1913 he was engaged by the Association for Improving the Condition of the Poor as director of its Department of Social Welfare.

ON May 1 the Public Charities Association of Pennsylvania gained a new secretary and social work enlisted a new recruit in the person of Robert Dunning Dripps. Mr. Dripps is one of the best known of the younger progressive Philadelphians who has lately come to the front in civic movements.

The son of a Scotch-Irish Presbyterian minister, he naturally attended Lawrenceville and later Princeton, where he was graduated in 1898 after service on debating teams, and college publications that showed early the bent of his mind. He entered City Councils from the Germantown district when the Blankenburg administration began and has been floor leader of the reform forces in Common Councils from the first. He is on the Board of Directors of the City Club of Philadelphia and is chairman of its Executive Committee.

A lawyer by profession, and by disposition a willing horse, he has more and more been hitched up to social movements in his native city and state so that there is little change in his relation to the community now that he is harnessed to a definite piece of social work.

In 1912, when the Progressives captured the Republican state convention, Mr. Dripps served on the executive and legislative committee, a continuing body which held public hearings over the state and did notable work in drafting legislation on child labor, hours of labor for women, minimum wage for women, regulation of public utilities, workmen's compensation and regulation of public charities. The hearings given on public charities offered a most effective means for bringing into the light of publicity the deplorable muddle of Pennsylvania's system of indiscriminate subsidy to private charities at the expense of the state's wards.

The Public Charities Association, organized about that time, was also active in furthering legislation affecting its field of work but was only partially successful in its first foray on Harrisburg. With his training and experience in legislative work, Mr. Dripps, should be an effective leader in the movement that has now gained very considerable headway. A new Legislature meets in 1915 and an awakened public opinion will demand that the insane be taken from twenty county almshouses to proper state institutions, that the feeble-minded be given adequate institutional care before the usual millions are appropriated in planless fashion to private charities with no state supervision, and that other modernizing changes be made in the state's care of its dependent, defective and delinquent charges.

ALEXANDER M. WILSON.

IN recognition of his twenty-one years service as head of the Child Welfare Department of the Province of Ontario, J. J. Kelso has been granted

LT. COL. CHARLES E. WOODRUFF

An army sanitarian who has been made health officer of New Rochelle.

ROBERT D. DRIPPS

New Secretary of the Public Charities Association of Pennsylvania.

J. J. KELSO

For twenty-one years head of Child Welfare Department, Province of Ontario.

a six months leave of absence in which to study social conditions in Great Britain. He left May 19 with his family.

Mr. Kelso has been continuously in philanthropic work ever since, as a Toronto newspaper man, at the age of twenty-two, he began to write the story of the street waif and the humane treatment of animals. While still in journalism he organized the Toronto Humane Society and later in the same city the Children's Fresh Air Fund, the Children's Aid Society and the Playgrounds Association. He has helped to organize work for children in many cities and provinces of Canada.

The Toronto Star recently said that Mr. Kelso had performed a more valuable service in preventing crime than half the police force of Ontario. He has become well known in this country through his attendance at the National Conference of Charities and Correction.

DR. C.-E. A. Winslow of the College of the City of New York, curator of the American Museum of History, has been appointed consulting expert in education of the New York State Board of Health. Dr. Winslow plans the early issuance of a number of leaflets dealing with the prevention of infant mortality.

WILLIAM O. THOMPSON, counsel for the federal Industrial Relations Commission, came conspicuously before the public not long ago when he prevented the termination of the protocol of peace between the manufacturers and the unions in the great New York city cloak trade. By his handling of a situation which even the most optimistic believed would end in a general strike, Mr. Thompson proved his ability to analyze and adjust intricate problems of industrial relations.

For the last three years he has been union representative on the Board of Arbitration for the Hart, Schaffner & Marx clothing factories in Chicago. In 1891, after he was admitted to the bar

from Northwestern University law school, he became law partner of John P. Altgeld, former governor of Illinois, and Clarence S. Darrow. Later he was counsel for the National Biscuit Company and other large corporations, so that his experience embraces unusual understanding of the point of view of both employers and workers.

Mr. Thompson was born in England in 1870.

IN appointing Dr. Richard H. Harte to succeed Dr. Joseph S. Neff as director of the Department of Public Health and Charities in Philadelphia Mayor Blankenburg has the general endorsement of the medical profession in Philadelphia. He has also followed the tradition which demands that a physician head the department.

Dr. Harte is independently wealthy. Upon becoming director he gave up his medical practice and his extensive hospital connections. During the remaining year and seven months of the Blankenburg administration he will devote himself exclusively to work for the city.

Dr. Harte was born Oct. 23, 1855. He is a graduate of the medical school of the University of Pennsylvania and for some time was a member of its teaching staff. As a surgeon his standing is high. He has also had much experience in hospital management, having been for many years closely associated with the

RICHARD H. HARTE

Director Philadelphia Department of Public Health and Charities.

Pennsylvania and Episcopal Hospitals in addition to having connections with a number of other institutions. In politics he is an independent. He served for three years as a member of Select Councils, having been elected on the ticket of the Keystone party, one of the many organizations which from time to time have sprung up in Philadelphia in an effort to overcome boss rule.

THE PRICE OF A PENCIL

C. M. Goethe

COULD a reporter's pencil write a story of its own? It has one that ought to be told.

Running through the southern states is a belt of cedar. From these trees were split rails which have lasted nearly a century. The rail fences are as characteristic of the South as are the log cabins, the beautiful colonial homes of the young days of the republic, the famous singing of the plantation Negroes and their banjo music. But the rail fence is passing. It is being made into high-grade lead pencils. This conversion from fences to lead pencils unfortunately includes a story of exploited people—recreation hungry and easily imposed upon.

There are perhaps a dozen pencil mills in the South. The owners buy the fences, paying part cash and part in a wire fence. The product is shipped abroad to Austria, Germany, Belgium, where the graphite is pressed into the cedar strips and the finished pencils are made. Recently Japan has become a

competitor of Europe and a customer of the southern mills.

Upon an upper floor of a pencil mill the jigsaw men work. The air is as ruddy as if rusty snow were falling. "A generation ago we never had a death from consumption in our county. Recently we have recorded sixty odd deaths. We do not know the cause," said a betterment worker in one of the pencil mill sections.

The men are employed under the piece work system. They have no labor unions. They work much longer than the eight hour day some of us believe is none too short. But they also work under conditions which seem dangerous. The cedar rails are reduced to pencil lengths. Then the jig-sawyers cut them into slabs the width of a lead pencil. With unprotected circular saws, this means holding fingers uncomfortably close. In answer to the question, how many men were cut, came: "About one every other day."

The strips drop from the circular saws to a lower floor. Here girls sort and classify them. Some of these girls wear dresses only to their knees. They

look as if they ought to be at school or romping on a playground. The atmosphere is little, if any, less dusty than on the jigsaw floor. The workers are red with the fine sawdust. A newcomer can hardly breathe in the room. The hands are "speeded up" so that one is forcibly reminded of Jurgis in *The Jungle*. One sees them in all stages—from the plump, rosy-cheeked beginner just in from the farm to the gaunt, stoop-shouldered, hollow-chested woman, a pale-faced nervous wreck.

Going into the mill, one stumbles over cases of bottles of a certain "soft drink" stimulant, manufactured in the South. Evidently much is consumed. It is carried up and down the rows of workers. A short conversation with a young fellow of the type known as "the cadet" waiting at the mill door near the closing hour brought out this bit of philosophy: "Everybody's got their own peculiar graft in this yere world, stranger. I've got mine and I reckon you've got your'n. The foreman here's got the ——— graft," naming the above "soft drink." "His nephew totes the stuff to the girls and the men. They sign cards just like at your swell city clubs. He never loses a picayune—he takes it outer their pay. He says it's healthy, and it makes them work better, but I reckon all he worries about is the health of his bank account."

One of the floor bosses, when asked about labor unions, said: "You bet we ain't got any here. We've got labor

we can handle. We won't hire anybody raised in a town. We get 'em from the farms—back in the mountains—the kind wot's hungry for a good time. That kind will stand for pretty near anything." It was the old story of recreation hunger.

But the saddest of all was to come. Jane Addams once advised going to where the day's work was ending if one wanted to understand where the real trial came to the underpaid and overworked woman worker.

The week's work was almost over at the pencil mill. At the time-clock shed door stood several young fellows of the parasitical type. As the girls streamed out one of these vultures stepped up and took the arm of a pretty brown-eyed, rosy-cheeked girl. They were starting off together when another mill girl said to the fellow: "Bill, you ain't got no right to go off this way with Belle. You've got a wife and a baby."

"Oh, hell," was Bill's answer, "I don't care if you do tell her. Belle here looks pretty good to me."

Another chap stepped up to a wan-looking, coughing girl, who exclaimed with a startled look: "What, you here again! Ain't I got enough to rack me with the work in that mill all week without you coming to hound me when I'm all tired out? Please go away and leave me alone." There was low conversation for a moment. They went off together.

And this, because of our way of doing things, is the price of a lead pencil!

views were out of date, along with his reference to the Committee of Fifty. Perhaps if he would get the later views of Charles W. Eliot he would not find them as useful for his purpose, and it is probable that some of the other members of that committee have also advanced in learning since that time.

I do not understand Dr. Williams to allege that it is on account of this universal teaching of the ill effects of alcohol and tobacco that the consumption has so largely increased. It is certainly fair to ask how much larger the increase would have been if the instruction had not been given.

Perhaps, as Dr. Williams has written so much, he might be induced to write again to explain why he wrote at all, unless indeed he had in view the repeal of the scientific temperance instruction laws in the various states, in which effort I have no doubt he would have the enthusiastic assistance of the liquor interests of the country.

I understand that Dr. Williams has not confined his efforts to the above mentioned article but that the *Medical Record* of New York has been publishing a series of articles by him, which, I judge from a review I see of them, are as unworthy of publication as the article which I am now criticizing.

CHARLES E. MANIERRE.

New York.

TO THE EDITOR: Since one of your correspondents has suggested that I state my attitude in regard to teaching children the dangers of alcohol and narcotics, I will do so briefly.

I believe that every child should be taught the plain truth that such substances as alcohol and tobacco are peculiarly harmful to children. But the method of attempting to impress upon the child the dangers of narcotics by reiterating untruths is not in accord with the modern conception of what constitutes proper mental training.

EDWARD H. WILLIAMS.

Montclair, N. J.

TO THE EDITOR: As a sometime reader of *THE SURVEY* I cannot refrain from telling you how much the public is indebted to your periodical for publishing Teaching Temperance in Public Schools by Dr. Edward H. Williams. The only criticism I can offer is that the publication of this very valuable essay is about twenty-five years too late. It has been established from time immemorial that the exaggeration of evil simply aggravates evil. While I do not wish to have it considered that I would hide evil under a bushel, yet to flaunt it before minds unprepared through lack of social experiences arouses desires in the individual and tempts him even so little to taste of the thing forbidden. Such is the power of temptation.

J. A. RONEY.

Newark, N. J.

TO THE EDITOR: I am glad that one paper has had the courage to publish the truth about that miserable humbuggery, temperance instruction in our public schools. When will good peo-

Communications

TEACHING TEMPERANCE

TO THE EDITOR: I regret that you should have admitted to your columns the communication by Edward H. Williams, M.D., respecting Temperance Instruction in Public Schools. Giving it a prominent caption under the heading of Education in the issue for April 18, makes it seem to go out with your endorsement.

As to most of the persons who write for your paper it is abundantly apparent that they have strong convictions and are endeavoring to contribute to the advancement of the human race. The reader usually gets that impression whether he agrees with the views expressed or not. Perhaps I do Dr. Williams an injustice, but his article does not produce that impression in my mind. I do not find in it any abhorrence of the alleged large increase in the per capita consumption of alcoholic drinks, nor any helpful proposed changes in the method of instruction, but merely a slur at the conscientious, long continued, unremunerated and patriotic ef-

forts of people like Mary H. Hunt.

I have read Dr. Williams' article through, although I do not consider that it was worthy of that attention. His deadly parallel is to my mind contemptible. Many words have more than one meaning, as for example the word "church" which may be used in half a dozen senses. To say of alcohol that it was in a technical sense a food, when writing for medical students, because it showed certain food qualities in spite of its poisonous character, does not in any way contradict the statement in a child's book that alcohol should not be deemed a food. A child's idea of food, in common with that of most non-professional individuals, is something that is suitable to eat or drink for nourishment.

Dr. Williams holds to the ancient idea that alcohol is a proper dose in typhoid and pneumonia. He ought to know that there is plenty of authority for the contrary view. In fact, from my limited knowledge as a layman, I should have said that Dr. Williams's

ple learn that they cannot advance a worthy cause by lying? The church has had plenty of experience of the futility of pious frauds, and the oppressive portions of it have learned the lesson. But whole multitudes of well-meaning people still go on in the same old dreary path of misrepresentation.

Everybody with an inkling of sense knows that the temperance instruction in these public school text-books is not scientific, is not true, is not effective. The teachers know it, and many of them slur it. The very writers of these chapters know that they are employed to make out a case. And the parents that so often are insulted by these lurid denunciations tell their children, as I have told mine, to pay no attention to these "yellow" misrepresentations. And, after all these years of frenzied temperance instruction, the American people are drinking more per capita than ever before.

Temperance, anyhow, is partly a moral and partly a prudential thing. The place for moral instruction is principally the home and the church. The place for prudential instruction is mainly the home and the world. The school can do a little for temperance, but not much; and nothing at all by lurid lies.

E. A. WASSON.

[St. Stephen's P. E. Church.]

Newark, N. J.

TO THE EDITOR: Your new Arkansas subscriber is not sure that she will appreciate your magazine inasmuch as you have attacked scientific temperance instruction in the public schools. The article cites men who try to prove its teachings spurious. I can give an array of splendid M.D.'s who have really contributed something to the betterment of the morals and habits of the world who uphold the splendid work in that line. My! My! If alcohol is not a poison, then I say let us nurse rattlesnakes.

JANE CARR PITTMAN.

Prescott, Ariz.

TO THE EDITOR: As an early victim of "scientific temperance" text books, I am moved by Dr. Williams' article to give expression to some recollections.

These "scientific temperance" text-books following a rumor of innovations and forced subjects of study were met first with antagonism and then wonder by some district school children. To the children the previous requirement that they buy all their own school books meant some independence in the choice of books studied; hence their antagonism toward enforced study of the subject. It was a compensating feeling to the heads of large families that at last there were some books they need not buy.

The books were found upon arrival to decrease in enthusiasm for "narcotics" (geometric progression, multiplier about one-half) as they increased in size (geometric progression, multiplier two). Consequently the nineteen chapters on "narcotics" in the beginning book were represented by five in the larger book. But if the impression of a child may be trusted, this was somewhat

offset by paragraphs and questions on the effect of narcotics appended to each chapter.

These books were, we understood, provided by the state and we were to be obliged to peruse them a certain number of days each week. At first this was conscientiously enforced by the ever-changing army of district school teachers. When the books were no longer a novelty and many could recite paragraphs with fluency if not understanding, the teachers' elastic consciences trained by the tiresome routine lessened the requirement to a matter of using brief "scientific temperance" text-books as readers a few times a week.

It must have been about 1888 that the books were initiated in those district schools; and the writer, though a young child, was considered too advanced for the primary book which, as Dr. Williams remarks, had a treatise on stills. She was somewhat chagrined that after hearing frequent recitations on that alcoholic book and the still, real understanding of its mechanism and the making of brandy were not the property of her feminine mind. Often during later years in college and business laboratories it was not the essential principles of those books—long lost in oblivion—that came to her, but as she adjusted stills whose mechanism was as familiar to her as the egg-beater and the mixing-bowl; but an inner smile came at the evasion of the principles of that mechanism which in her plastic, childish mind left among the grooves worn by "scientific temperance" books, the deepest furrows.

Hanover, N. H.

SIDNEY WEBB'S "EXTENSION LADDER"

TO THE EDITOR: Mr. Webb's fine analysis [See THE SURVEY of March 7] of the relations of public and private charity deserves the grateful recognition of American social workers. His presentation of the advantages and the defects of both methods is not altogether new to us, but compels readjustments of thought.

Some of us remember that in the gush of springtime we of the C.O.S. had visions of the total and early abolition of outdoor public relief. We ignored the history of relief in England in the century previous to the enactment of the Poor Law in 1601; we were not then so familiar with the Elberfield system and the possibility of organizing friendly visitors under municipal administration; we did not have so keen a hope as now of reforming the Civil Service; we did not foresee the action of France in 1905 which brought over the first Latin nation to the public outdoor relief policy; and we did not understand how deeply rooted in custom, law and democratic sentiment this mode of relief actually has become since Colonial days in our country.

The C.O.S. at first was reactionary, individualistic, *laissez faire*, and is still more aristocratic than the German public system. Mr. Webb hints at this, and

some day we are sure to have a rude awakening to the fact. Ask the first trade union man what he thinks of us and all our tribe!

Yet private charity has a lasting function as it has an honorable history, for it made universal public charity possible; it furnished the leaven, even if its supply of flour was inadequate. It made all modern peoples believe that the weakest citizen is an object of universal interest, that the state has a duty to the indigent; it made the Poor Law inevitable.

The central contention of Mr. Webb is sound: private charity must not divide cases but offer its peculiar and indispensable service to supplement public relief when this is weak. So long as we try to divide the field we shall be in antagonism to the state, and the struggle must issue in defeat. Sympathetic, persistent co-operation alone will give us a right to partnership. We must not build our organization on despair of the republic and on contempt for officials; we shall have democracy on our heads, and rightly. We can try experiments, give special help, apply spiritual influences when they are appreciated, and transfigure the machinery of law by the radiance of voluntary devotion.

We should take to heart the rebuke of our use of the category "unhelpable," and send that monstrous and detestable word of doom the way we dismissed the other cruel and blind epithet "the unworthy." Private charity has no exclusive classes; it will find its way even into state institutions and illumine the gloomiest recesses with its cheerful hope and tender service.

On one point Mr. Webb rather overstates his case: "All the voluntary charities for children, however good their effect may be on the child, are necessarily unconnected with any enforcement of parental responsibility." Any one who watches the daily appeal of organized charity to the juvenile courts or courts of domestic relations will know that private charity is not so helpless. Indeed the enforcement of parental, filial, and all domestic responsibility by appeal to law is a marked feature of the work of our societies.

CHARLES RICHMOND HENDERSON.

[The University of Chicago.]

Chicago.

TO THE EDITOR: Sidney Webb, in his article in THE SURVEY of March 7, maintains that whereas voluntary agencies in charity have the duty of performing the "service of invention and initiative and perpetual experimenting in the unknown, . . . the public authority alone can perform any task completely and continuously." The contention unquestionably fits, in the main, the facts of today. Private charity has within a limited field "tried out" new ideas which the public has later applied over a wide area. Should we accept this as the permanent division of function between public and private charity?

Mr. Webb discards what he calls the "parallel bar" conception of their relationship; namely, that of a mere division of cases between them by which the help-

able are allotted to private charity, the unhelpable to public. With this position I am heartily in accord. Any public body which is properly equipped to tend "unhelpable" cases can certainly cope with any hopeful case that does not call for an unusual expenditure of money. The easy-going notion that because a needy family is deemed hopeless it may be dropped into a social dump,—the almshouse, for instance—and there left in passive stagnation to be merely fed and clothed, must give way before the resourcefulness that is beginning to enter into the public care of dependents. As one who has given several years to social service in an almshouse hospital, I venture the suggestion that the term "unhelpable" is out of date.

The plan which Mr. Webb advocates is for a division of function by what he calls an "extension ladder" relation between them. Private societies are to be "constantly raising the standard of civilized conduct and physical health above the comparatively low minimum which alone can be enforced by the public authority."

A public worker may be allowed to demur at this inert and humdrum part which Mr. Webb assigns him. The impression that initiative can have but slight play in public charity holds back many able workers from enrolling themselves in the public service. It is true that new ideas receive readier acceptance in private work. It is not therefore true that initiative has not ample scope in public charity. Take, for instance, the work of inspecting private agencies on the part of the Massachusetts State Board of Charity. In the course of that work we frequently find beneficent patrons spending capital on institutions perhaps for classes of persons "statistically of no great importance to the community," while an experiment looking to a large social policy awaits the necessary funds. Such donors suffer for lack of the constructive guidance which could emanate from a public board with a survey of the whole field.

What holds regarding the wide outlook of a board which inspects private agencies, holds also for a board which administers public relief. The large number of cases they handle gives a chance for insight into underlying conditions. They are therefore in a peculiarly advantageous position to indicate new needs, new fields for investigation. They may not think best to make a given experiment themselves, but they must have initiative in order to point out the openings to others.

May public charity ever venture into experiment? Certainly not in the sense of attempting mere novelties in social effort. Conservative experiments, however, such as consist in a fresh applying or combining of already tested methods, would enlist the confidence of the public. For example, the placing out and after care of mothers from the Massachusetts State Almshouse Hospital was an experiment in the sense that no one knew the types of cases for whom the arrangements were to be made, and that very little work had as yet been done in setting standards in the unmarried mother problem. But since hospital social serv-

ice had proved successful, and mothers with infants had been placed out with good results, the combination in an almshouse hospital carried enough assurance of success to justify introducing it at public expense.

The experimenting open to public charity may bear not only upon developing methods with its beneficiaries, but also upon ascertaining removable causes of their dependency. Its advantage over private charity in that it has some authority over recipients, that its contacts are with cases more humanly varied and socially representative empowers public charity to maintain a sustained and thorough observation of the ramifying effects of any given procedure.

ADA E. SHEFFIELD.

[Massachusetts State Board of Charity.]
Cambridge.

TO THE EDITOR: Mr. Webb's "extension ladder" article in your issue of March 7 is one of the finest explanations I have read of the complex, elusive relationships between public and private philanthropy. Private effort has certain great advantages and offsetting drawbacks, three in each instance, according to the author. Public and private works should not be, and are not, prosecuted in parallel and mutually exclusive fields. Rather are private undertakings the "fingers by which the stiffly moving machinery of collective action can be brought most effectively to bear upon particular cases." The exposition has all the advantages of simplicity and of physical figure.

There may be some difference of opinion on this very ground of simplicity. The presentation of advantages and drawbacks of private philanthropy, which are at the same time a comment on the scope of public effort, can be only an average or summarizing statement. Contrary examples and reasoning are possible under each heading.

True, for purposes of practical administration there must always be a division of labor. But let this occur according to circumstances, and not through the adoption of a principle, such as, that private agencies shall be the fingers, or antennae, by which adjustment and direction are given the sluggish public machinery. Then we should have to discard the research bureaus and advanced experiments now being conducted under governmental auspices.

In fact, in this age of striving for social justice governments are functioning in many ways bearing on human distress which can be called neither slow in respect to adoption of new ideas nor in the older and more restricted sense charitable. Consider, for example, recent extensions of the police power.

The scientific study of relief methods is young, and the possibilities of public and private co-operation are unrealized. Naturally, we have first studied public and private agencies separately, as it were, in a vacuum. With the increase in numbers of those in distress who have no first-hand call on the sympathies of their fellows individually, we are better enabled to study the process of relief and remedy as a whole.

This growing objectivity of the study

is resulting in a demand for comprehensive action on the part of both public and private agencies. For instance, we are setting out to reduce feeble-mindedness by the use of all means, whether public or private. It would be hard to determine which class of agencies is functioning in the more progressive fashion.

Social groups function in the field of philanthropy according to the differing bases of their organization, the state being only a special kind of group. The charitable activities of private, non-official groups are made to seem more erratic because of the wide range given personal initiative, many private charities being dominated by individuals. But there is a constantly increasing standardization and broadening of vision among private charities, and recently an extension over them in some places of comprehensive public supervision. Conversely, public charities are adopting more of the particular excellencies formerly ascribed only to private agencies.

The two forces are approaching. But they will never coincide, because of the difference in nature and functional possibilities of government, on the one hand, and voluntary groups and individuals, on the other. That difference varies with particular social problems and periods in the development of social feeling. It may not be possible to agree upon a satisfactory expression of the relations of public and private philanthropic endeavors of all types for all time.

The GIST of IT—

LABOR men had their innings before the Industrial Relations Commission last week. Page 230.

FOR the forty-first time, the National Conference of Charities and Correction has been in session to canvas the full range of social subjects through an entire week. Two threads ran clearly through it all; the crying need for better public service, since that service continues to take over social work; and the needs of the countryside, social and economic. The form of organization, the race question, and the morals of Memphis, the meeting place, were prominent subjects of discussion. Page 232.

THE whole range of child-saving was covered by the committee on children. Page 235.

THE fundamental importance of the family in all social problems was the chief note before the committee on family and community. Page 236.

RECREATION as a prime factor in the movement toward democracy and in building character was brought out strongly by the committee on neighborhood development. Page 236.

THE committee on corrections centered its program on the short-term prisoner. Road-building for convicts was opposed. Page 236.

SEGREGATION, as against sterilization, was advocated by the committee on defectives. Page 237.

FATHER O'HARA'S report of the successful working out of the Oregon minimum wage law was the new and striking feature of the program of the committee on standards of living and labor. Page 238.

THE committee on public charities came out strongly against haphazard legislation, and in favor of uniform grounds for commitment to state institutions. Page 238.

BETTER laws and better law-enforcement, and the growing public opinion against permitting segregated vice districts were two of the strong points made by the committee on social hygiene. The Memphis red light district furnished a timely example. Page 239.

RURAL health and hygiene and the organization of work to prevent cancer led in the discussions of the health committee. Page 239.

GRAHAM TAYLOR'S presidential address on the county. His plea was for better organization and better public service. Page 240.

EIGHT other social bodies, sectional, racial or specialized in scope, met jointly with the national conference at Memphis. Page 244.

A week earlier the National Tuberculosis Congress laid stress on considering the family rather than the individual in the prevention and the treatment of tuberculosis. Page 229.

BOYCOTTS AND THE LABOR STRUGGLE

By HARRY W. LAIDLER, Ph. D., LL. D.

With an Introduction by Henry R. Seager, Ph. D., Prof. of Political Economy, Columbia University

Crown 8vo. Cloth. 488 pages. \$2.00 net. By mail, \$2.15

A timely, trenchant and authoritative discussion of the economic and legal aspects of the boycott as used by the various groups in society, and especially by labor.

The book also presents a cross section of the present labor struggle. It deals, among other things, with the employment in labor disputes of "spies," strike breakers, private detectives and of the blacklist, and analyzes the forces controlling the press, the pulpit, the platform and such governmental agencies as the police, militia, constabulary and courts. Sabotage and other labor weapons recently resorted to by workers are also explained.

"Mr. Laidler's book is a sincere and successful effort to describe the nature and effects of a weapon of industrial warfare which has aroused particular antagonism. The reader will find in it a description of all forms of boycott, a history of the most important cases, and an analysis of the legal, economical and social questions involved. All this is done in a clear and readable style and in a spirit which must arouse even in the prejudiced reader a desire to see both sides of the question."
—Dr. L. Levene in *The Survey*

All wishing to obtain

into the causes Economic and Legal underlying the recent Industrial Warfare in Colorado and elsewhere should read
**BOYCOTTS and the
LABOR STRUGGLE**

"Boycotts and the Labor Struggle" is a valuable and comprehensive contribution to the literature dealing with this phase of the industrial problem.

—John Mitchell.

I have read "Boycotts and the Labor Struggle," every word from cover to cover. It is scholarly and seems to me to be a statesmanlike presentation of an important subject.

Florence Kelley.

It has a breadth of vision not frequently found in American works dealing with labor problems.—Dr. I. M. Rubinow.

JOHN LANE COMPANY - Publishers - NEW YORK

THE SURVEY

COMMON WELFARE

NEW PENNSYLVANIA HOUSING ASSOCIATION

PENNSYLVANIA has gone on record for state-wide housing reform. In a conference held at Harrisburg delegates from nineteen cities organized an association definitely committed to a program to secure housing legislation for rural communities as well as large cities and community planning for all, irrespective of size.

Need for concerted action was felt because of recent legislation empowering the cities of the state to organize town planning commissions, and especially on account of the prospective report of the State Building Codes Commission which for three years has been drafting a comprehensive code for the entire state.

This codes commission has taken advantage of the phraseology of the resolution creating their office to enlarge upon the usual building code so as to include housing provisions and to extend state supervision under both sets of regulations to cities as well as to rural areas.

While there was general acknowledgment at the conference of the necessity for laws regulating dwellings there was also a strong demand for other methods of attacking the housing problem. Several speakers dwelt upon the prime importance of enforcing such laws as we now have. "The person who laid most stress upon this was Mrs. Franklin P. Lams of Pittsburgh.

Assistant director Wilson of the Philadelphia Department of Public Health and Charities showed clearly the difficulties of those who would enforce legislation. He exposed the methods of the gang politicians in Philadelphia, in thwarting the enforcement of health regulations and in turning the Bureau of Health under the former administration into the most gang-ridden branch of the city government. Not until the man who had the responsibility of enforcing existing legislation was freed from the blight of politics would any law be of much avail to any community, he said.

A paper that appealed particularly to representatives from commercial bodies was given by Carol Aronovici of the Philadelphia Suburban Planning Association. He warned the small cities that their program of community boosting would react decidedly unless community planning went ahead of it.

Gifford Pinchot and Congressman Bailey both emphasized the importance of a proper system of taxation in any program for community betterment. There was a tendency to trace back the cost of housing to economic conditions that affected building material and price of labor, while the lack of community foresight which permitted local improvements to be inaugurated without respect to their ultimate effect upon the critical consideration.

homes of the people also came in for The following were elected officers of the newly created Pennsylvania State Housing Association: president, Samuel S. Fels, Philadelphia; vice presidents, C. P. Hill, Pittsburgh, D. W. Harper, Erie; secretary, Sherrard Ewing, Reading; and treasurer, William Jennings, Harrisburg.

Thirty men and women were elected to membership on the board of directors from widely scattered cities and boroughs throughout the state.

TEN YEARS OF CAMPAIGNING AGAINST TUBERCULOSIS

THAT THE anti-tuberculosis campaign is being furthered throughout the United States along lines of more intensive as well as more co-ordinate endeavor was evident at the tenth annual meeting of the National Association for the Study and Prevention of Tuberculosis, held in Washington, D. C., May 7-8.

Problems of particular interest relating to family care as opposed to individual care, what to do with the discharged consumptive, the relation of childhood to tuberculosis, and the relation of tuberculosis to the public health campaign with the possible expansion of work, were discussed.

Dr. John H. Lowman of Cleveland, president of the association, sounded the keynote of the conference, pointing

out that the time has come in the anti-tuberculosis movement to transfer interest in the individual alone to interest in the family as a unit of approach.

"Too great individualism, too much concentration on the patient," said he, "insulates too sharply the man in trouble as well as the social agent who strives to help him and isolates the society in which both are so intimately concerned. The tuberculosis question cannot be treated from the individual case."

Perhaps the most interesting discussion of the entire conference centered about the session devoted to Medical Examination of Employees. Dr. Theodore B. Sachs, president of the Chicago Tuberculosis Institute, presided. Chicago's experiment in this interesting work was told by Dr. Sachs, Dr. Harry E. Mock, and Dr. James A. Britton of Chicago. The plan is to examine each applicant as he enters employment and to repeat the examinations thereafter every six months. In Chicago the workers are followed up in their homes by visiting nurses, who seek to protect the health of other members of the family. To this point Samuel Gompers, president of the American Federation of Labor, who discussed the subject, took vigorous exception. He favored the plan of medical examination but thought the follow-up work in the home by the employer might usurp the freedom of the home.

The first section of the sociological section presented papers of unusual importance by Dr. William Charles White of Pittsburgh and Dr. James Alexander Miller of New York and Dr. John B. Hawes of Boston on problems related to the family and tuberculosis. Dr. White claimed that "all lines of tuberculosis activity lead more or less directly back to the great truth that most of the implantations of this disease occur in childhood." Dr. Miller thought that the time had come to discriminate with various cases dealt with, concentrating work in places where the danger is greatest and most acute. Dr. Hawes held that the direct infection of children by their parents or other members of the family who have tuberculo-

sis is very largely responsible for the spread of the disease.

Dr. Charles F. Bolduan of New York, speaking on the Subsequent History of Cases Discharged from Tuberculosis Sanatoria, asked if the time had not come to stop advising consumptives as to the importance of fresh air in the home—in short, to stop telling them to do the impossible, unless we take energetic steps to place all needed things within their reach. It was easily seen that this matter of dealing justly with the discharged consumptive is one of the most acute problems of the anti-tuberculosis crusade.

One of the most interesting discussions of the sociological section was that led by Frank H. Mann of New York on the question of open-air schools. From experiments in New York Mr. Mann is satisfied that extra feeding may be eliminated and that the provision for rest is not essential. All schools can now be open-air schools by simply opening the windows, allowing the children to wear their outdoor wraps and if desired asking them to bring a lunch from home. This discussion was supported by Lawrence Veiller, who said: "Pry open the windows in all class rooms in all school houses in the United States."

Dr. Livingston Farrand, former executive secretary of the association, who attended the conference as a delegate from Colorado, thought the success of an organization might be measured in a degree by the municipal co-operation it was able to secure.

Dr. E. F. McCampbell's paper on the State Health Department and the Tuberculosis Problem held that tuberculosis work in states such as Ohio could be carried on more effectively if it were co-ordinated under one state body, like the State Board of Health. He outlined the work which is being carried on under the recently organized division of tuberculosis in his state, and spoke of the satisfactory progress which the anti-tuberculosis campaign is making.

At the business session a resolution of appreciation was voted Dr. Farrand for the splendid work he accomplished with the national association in his ten years of service as executive secretary. Officers were elected as follows: president, Dr. George M. Kober, Washington; vice-presidents, Lee K. Frankel, Ph.D., and Dr. W. Jarvis Barlow, Los Angeles; secretary, Dr. Henry Barton Jacobs, Baltimore; treasurer, William H. Baldwin, Washington.

At sessions of the National Conference of tuberculosis secretaries, held in connection with the conference, papers were read by Seymour H. Stone of Boston, Ernest D. Easton of Newark, and Miss F. Elizabeth Crowell of New York. The following officers were elected: President, George J. Nelbach, New York, and secretary-treasurer, Seymour H. Stone, Boston.

MEETING MUNICIPAL NEEDS IN NEW YORK

MUNICIPAL needs filled an important part in the program of the New York City Conference of Charities and Corrections held May 19-21. The practical value of considering such a subject was demonstrated when the various committees appointed at last year's conference to consider the question of municipal needs rendered accounts of their work.

The city budget conference committee reported success in advising the Board of Estimate regarding its apportionments to civic and charitable enterprises; the family desertion committee reported an appropriation of \$4,300 by the Board of Estimate for investigators in the desertion bureau of the Department of Public Charities; the committee on adequate appropriation for child-car-

ing institutions reported an advance in rates paid for the care of dependent and delinquent children and the introduction of a standard system of book-keeping in child-caring institutions.

In discussing future municipal needs Leo Arnstein, assistant to the president of the Board of Aldermen, called attention to the new committee on social welfare which the present administration had created to offer suggestions and formulate policies as health, charities and corrections.

Other sessions considered Families, Children, Delinquency, Public Health and Settlements and Recreation.

The officers elected for the next City Conference are President, Thomas W. Hynes; 1st Vice-President, V. Everet Macy; Treasurer, Edmund J. Butler; Secretary, John B. Prest.

EMPLOYMENT AGENCIES, SOCIALISM AND UNIONISM ON THE STAND—BY JOHN A. FITCH

Probing the Causes of Unrest

III

The third of a series of interpretations of the hearing before the Federal Industrial Relations Commission by a staff representative of The Survey.

With Samuel Gompers, president of the American Federation of Labor, heckling and challenging Morris Hillquit, member of the executive committee of the Socialist Party, and with Mr. Hillquit baiting and worrying Mr. Gompers, the scene before the Federal Commission on Industrial Relations in New York city last week was intensely interesting, if not overwhelmingly edifying.

The first half of the week was devoted to a consideration of the problem of finding employment; the latter half gave opportunity to representatives of the American Federation of Labor, the Socialist Party and the Industrial Workers of the World to explain their purposes and methods.

William Leiserson, superintendent of state employment offices in Wisconsin, had charge of the hearings on employment. Witnesses, representing civic and philanthropic societies and public and private employment bureaus, were asked to give their views on the adequacy of existing agencies for distributing labor and for disseminating information re-

garding opportunities for employment.

The private employment agents themselves gave convincing evidence of their shortcomings. Total lack of co-operation, inability or unwillingness on the part of the average agent to investigate fully a call for labor, and a deeper concern for profits than for meeting the problem of unemployment, were some of the fundamental defects which the testimony disclosed.

Mrs. S. J. Atwood, who has conducted an employment agency in New York for more than twenty years, and whose standards were commended by many disinterested witnesses, told of a call last winter from near Albany for twenty-five men. Accidentally she discovered that five other agencies had received an identical order from the same firm. She got the company on the long distance telephone and inquired whether they needed 25 men or 150. They replied that twenty-five were wanted. Accordingly, she made no attempt to fill the order.

The other five agencies made no inquiry, but sent men. 125 men therefore reported for work, and the first twenty-five got the jobs. There was no other work in the vicinity, and the others had no alternative but to beat their way back to New York.

James E. March, who for twenty-eight years held an exclusive contract for furnishing track laborers to the eastern divisions of the Erie Railroad, described his method of dealing with this labor. He charges the laborers a fee of 10 per cent of the first month's wages (the railroad pays them \$1.25 a day). He houses them in box cars with wooden bunks built in, and charges each man a dollar for a mattress and a dollar and seventy-five cents for a blanket. In each camp he maintains a store or commissary, and sells provisions to the

men, which they cook themselves. The amount the men have left at the end of a month, on a wage of \$1.25 a day, may be imagined. March admitted that 25 to 30 per cent of his men leave after every pay day. That enables him to send more men and get more fees.

It is by such methods, students of the subject told the commission, that unemployed men tend to become unemployable. Mrs. Atwood declared that if there were 200,000 unemployed men in New York last winter, 100,000 of them were unemployable.

The commission has a tentative plan, the essentials of which were favored by most of the witnesses, which is designed to remedy most of the obvious defects inherent in the present unregulated system of private agencies. By establishing a network of governmental labor exchanges all over the country, and by strictly supervising the private agencies and requiring them to make regular reports to the government, it would be possible to furnish reliable information to workers looking for jobs, and to employers looking for help. With adequate inspection powers, which the plan also includes, the exploiting of men in labor camps could be greatly checked.

VINCENT ST. JOHN, secretary, and Joseph Ettor, general organizer, explained the policies and aims of the I. W. W. St. John declared that any methods in industrial difficulties that seemed to be effective would be favored by his organization. It would not stop at injury, either to property or persons. "Why should we hesitate about destroying property?" he asked. "It isn't ours. Instead, the employer uses it to our disadvantage whenever he can. Furthermore, he isn't careful about our property, our physical and mental power, the only property we have. He sends us into the mines as children, without a semblance of an education, speeds us up, underpays us, wears out our bodies, and then, without a thought for our well-being, throws us on the scrap heap or abandons us to the poor house when we are no longer useful."

Violence, he told the commission, is not the choice of the working people. It is forced upon them, and it is not to be expected that their ends can be accomplished through its employment. Success depends on one thing only, an organization effective enough to secure control. Violence will then disappear.

St. John and Ettor both declared that time contracts will not be made by the I. W. W. With a time contract an employer has a period secure from demands on the part of labor in which he can make preparation for the conflict that may come. The workers, on the other hand, have given up their right to press any advantage that might arise during the term of the contract. The only I. W. W. contract that can

be made with an employer is an agreement to go back to work when the employer is ready to establish the conditions that may have been demanded.

In answer to a question as to whether the I. W. W. favors arbitration, Ettor replied that the policy of having questions threshed out by committees of employers and workmen is favored. He said the organization would be opposed to bringing in an outsider because the third man in an industrial dispute is usually an employer "who has so organized his own business as to have time to engage in a social sport known as 'civic duty.'"

The present paid-up membership of the I. W. W., according to St. John, is just over 14,000.

MORRIS HILLQUIT was delegated by the Socialist Party to explain that movement to the commission. He declared that the growth of the factory system had so changed conditions that it had led to the separation of society into two distinct classes, the capitalist, or employing class, and the workers.

When Mr. Hillquit left the stand, Chairman Walsh announced that Samuel Gompers would cross-examine Mr. Hillquit, after which the tables would be turned and Mr. Hillquit would cross-examine Mr. Gompers. For the better part of two days, then, from Thursday noon to Saturday noon, there was a battle of wits between these two men.

It was not a debate. Each directed his best energies to putting the other "in a hole." Gompers' attitude was one of scorn for the "dreamers" of the Socialist Party. Hillquit considered the present leaders of the American Federation of Labor "somewhat archaic, somewhat antiquated, and not progressive enough" to meet the economic problems arising today.

Mr. Gompers read into the record extracts from articles and speeches by Eugene V. Debs. He developed the fact that Debs was one of the original members of the I. W. W. and asked whether the attitude of the man who has been three times the candidate of the Socialist Party for president did not indicate that Socialists are opposed to the trade union movement.

Mr. Hillquit admitted that Debs, though he has left the I. W. W., is of the opinion that the American Federation of Labor is not well adapted to promoting the interests of wage-earners. But Mr. Hillquit denied that this in any way committed the Socialist Party to that idea. Personally, while not agreeing with the present leaders, he thought the federation is going forward and is serving the working people. He said he was opposed to the I. W. W., but he thought its existence has a significance that leaders of the older organization have failed to recognize. He charged the federation with

having been slow to look out for the interests of the unskilled laborers.

To this Mr. Gompers replied that the federation is spending more time and money on organizing the unskilled than on any other one object. They have organized in a single year, he declared, more unskilled workers than the entire membership of the I. W. W.

With Mr. Gompers on the stand, Mr. Hillquit endeavored to show that the A. F. of L. is in favor of the Socialist platform. He secured from the witness the admission that every plank in the legislative program is favored by the A. F. of L. except the minimum wage and legislative regulation of hours of labor for men.

"Then you agree with the Socialists?" suggested Hillquit.

"Before the Socialists had thought of those things the trade union men were working for them," replied Gompers. "You have purloined your planks from the labor movement."

Mr. Hillquit tried to get from the witness a statement of how far the trade unions are likely to go in their demands. "Will there ever come a time when the workers will be satisfied?"

"Not if I know human nature," replied Mr. Gompers. He would not say, however, that the workers will continue until they secure the "full product of their toil."

"The intelligent workmen," said Mr. Gompers, "prefer to deal with today's problems, in order to make tomorrow better than today, rather than to concern themselves with a picture and a dream."

"Has the American Federation of Labor a philosophy and a purpose, or is it only working blindly from day to day?" asked Mr. Hillquit.

Mr. Gompers refused to answer this question, declaring it insulting.

Mr. Hillquit drew from the witness the statement that the interests of employers and their workmen are not harmonious and cannot be made so. He then criticised Mr. Gompers for his affiliation with the National Civic Federation. To this Mr. Gompers replied that he would accept the aid of anyone in furthering the interests of labor.

ON Saturday morning Max Hayes, an organizer of the Typographical Union, explained his position as a Socialist and a member of the American Federation of Labor. The aims of the two organizations were in his opinion, quite consistent. He pointed out that the Federation has never taken official action with respect to the minimum wage. The Ohio Federation of Labor and many other labor bodies are on record as favoring such legislation. He also insisted that the federation is taking an interest in the unskilled, and is moving, though not as fast as he would desire, toward the industrial form of organization.

The Meetings at Memphis

Forty-first National Conference of Charities and Correction

May 6-15

Southern Sociological
Congress

National Conference of Jew-
ish Charities

National Probation Associa-
tion

American Association of
Officials of Charity and
Correction

National Conference on the
Education of Backward,
Truant, Delinquent and
Dependent Children

National Federation of Settle-
ments

American Association of
Societies for Organiz-
ing Charities

American National Red
Cross

THE group of national social organizations which center their annual meetings around those of the parent body, the National Conference of Charities and Correction, have always proved a quickening force in the conference city. This was peculiarly the case in Memphis.

It seemed quite in keeping that a conference at which the keynote of the presidential address was efficient public service in the county should be held in a community which has achieved commission government for the city of Memphis and in part for Shelby county.

Memphis is interesting and good to look upon. Here is a city which is ringed round with a green boulevard and has preserved in broad acres of parkland the trees and flowers just as they grew when Chief Chisca led the Chickasaws west from the seaboard to the Mississippi; a city which, without a break from Mark Twain's river days, has rendered notable medical service to its residents and to the strangers within its water gates; a city whose Juvenile Court not only deals with delinquents but supervises the newsboys, rewarding those who toe its mark with the most profitable corners, and licenses the caddies on the public golf links; a city, half black, that has found an efficient working basis for its white and colored charities; a community which has taught Negro gangs on the cotton presses to work with something like the speed and precision of New England factory hands while, a block distant, the typical darky drives a meandering mule to a creaking two-wheeled cart, singing the while in pure content at the sun which warms his back.

Memphis has historical background for its organized health work and its organized charities in the latest and worst of its yellow fever epidemics, that of 1878. The plague which reduced the population, by death and removal, from 100,000 to 10,000, led to the installing of one of the first city sewer systems in the country, by Colonel Waring, then a young engineer in New England who was yet to make his mark as the man who wiped New York clean. And it led, through the pressing need of the stricken families, to a visit by General Roelif Brinckerhoff who helped the women's clubs organize their charities to displace police doles.

One of the impressive factors in the social welfare of Memphis is the Associated Charities under the picturesque leadership of James P. Kranz, its general secretary. There was much talk of the socialized police of Memphis. There are one hundred patrolmen, every one of whom is familiar with the work of

the Associated Charities, and will refer any street applicant to its office.

Recently an emergency call came to the Associated Charities just as Kranz was leaving to keep an important appointment. After writing out a grocery order he asked the police captain to request the patrolman on the beat from which the application came, to call at the house and leave the order if he found conditions bad, summoning an ambulance if he found sickness. At eight o'clock that night Kranz received a telephone message from the captain saying that there was no acute illness, but that there did seem to be a lack of food and the patrolman had left the grocery order.

This forty-first National Conference of Charities and Correction had thus an interesting setting and it developed unusual features. It was the first to be attended by a delegation from the trades and labor council, marshalled in by President Graham Taylor himself, and by a squad of policemen who heard the discussions before the corrections committee. And it took a friendly but strong hand in various local problems.

The local matter that may very likely stick longest in the memories of the delegates and the crops of the Mem-

phians was the red light district. At the first meeting of the social hygiene section, Rabbi Emanuel Sternheim of Greenville, Miss., rose in the discussion to brand the Memphis district as the worst he had ever seen. He told of leading a party of conference members through its streets the night before—Sunday night—and called upon the conference to put their shoulders to the wheel of reform. Nightly thereafter, conference members, men and women, in twos and threes and larger parties, followed in his steps.

They saw much to condemn: a tolerated district a stone's throw from Main street; open advertisement in the names on the doors and the bright lights in the halls; women soliciting from the steps and on the sidewalks and, in at least one case, a young girl acting as lure; pianos playing, automobiles waiting, young fellows going "down the line" from house to house.

Those of the conference who went into the houses included Maude E. Miner of Waverley House, New York, Martha P. Falconer of Sleighton Farm, near Philadelphia, and others who have broad experience with delinquent girls and in controlling vice. They saw more. The girls are younger than in many cities—Miss Miner found at least two of 18 years—and all are American born of American stock, the daughters of Tennessee and Alabama, Arkansas and Oklahoma and Mississippi.

The district does not segregate vice here more than elsewhere. Memphis has scattered parlor houses, lodging houses, flats in business blocks, hotels which admit unlawful trade, street walking, and at least one amusement park dance hall in which supervision, if there be any, fails to purge its floor of the freest mingling of girls from shops and girls from Gayoso street.

Many of the people of Memphis resented all this as prying. They felt that their guests were exceeding the privileges of hospitality in thus overhauling the social plumbing and peeping behind discreetly closed doors to see if the servants had swept the corners clean. But others were willing to listen.

Miss Miner, Mrs. Falconer, James B. Reynolds and Dr. William F. Snow of the American Social Hygiene Association, Frederick H. Whitin of the Committee of Fourteen in New York, conferred with the mayor, the chief of police, the chief probation officer of the Juvenile Court and made some progress.

They found city officials pretty firm in the belief that conditions are not bad and that the 21-year age of consent was a real protection. But the latter comfortable assurance fell before Miss

Miner who showed that the law is a dead letter because of a qualification. The age fixed is 21, unless a girl has previously led an immoral life, when it is 12. Thus a girl of 16—or of 13—found in a disorderly house is not protected because she is quite obviously leading an immoral life. The statute fixes 21, the fact 12, which is perhaps as exact a reversal of a law's plain intent as could anywhere be found. Furthermore, the police pass on the age of girls arriving in town and their whole procedure has been to ask the girl her age and solemnly set it down.

The suggestion left with the city officials was, for local reasons, not to follow the recent example of some other southern cities in trying to make a clean sweep of the district—not to snuff the red lights in one big snuff, for fear they might gain strength of the city's indifference to burn the brighter. But gradually, house by house, to close up the district, as Pittsburgh did. To see to it that when an establishment failed or was closed, no other opened there or elsewhere to take its place, so that there would be a permanent net gain of one.

The time for such action seemed ripe. It was the unanimous testimony of the madams that their business has been hard hit by the state prohibition law. Two houses have closed in the best-paying block. None of the others dares sell liquor except the very light "Brewette," malted with such an infinitesimal amount of alcohol that it ducks under the law. The city has a reputation among traveling men and other transients of being "closed." If music were prohibited now so that boys would not go there to dance—if prostitution were reduced to a sheer case of prostitution without the spangles of amusement—a forward step would be taken.

The real case against a segregated district was brought home by Mr. Reynolds at an evening meeting in the Orpheum theater. More than one thousand people were present, half of them Memphians.

"I visited last night the segregated district of Memphis, located in the populous quarter of the city," he said. "I saw not only lewd men and women openly bartering, but in their midst groups of children, boys and girls, in plain sight and hearing of the noisy solicitation from the windows, obscene talk and gestures on the sidewalk—a day and night school of poisonous precept and example. Fifteen or twenty years hence, some of these children will come before the bar of justice for crimes of passion or lawlessness. But one who should be indicted as an accessory before the fact of their crimes will not stand with them before the bar of justice. That one is the city of Memphis, responsible for creating and continuing their compulsory training in debauchery."

There is a spirit of indifference to prostitution in the town that was hard for some visitors to understand. It has roots, perhaps, in the preoccupation of a people sorely tried, harassed by war and smitten by plague, only recently coming to its own as a community; perhaps in an unconscious recognition of the hu-

man quality of the prostitute which is enduringly expressed in that most curious monument in its cemetery—a monument to a prostitute erected by subscription. During the decimating yellow

fever epidemic of the 70's, the keeper of the largest brothel in town turned her house into a hospital, her girls into nurses and spent her capital for the sick. When she died, some of her fellow townsmen marked her grave with a monument.

But at least one woman in Memphis has seen the handwriting on the wall. She is the keeper of a brothel, a recent arrival who was driven out of a similar occupation in Washington when Congress passed the Kenyon bill. She went to the big evening meeting of the social hygiene section with a delegate from Washington, heard the speakers from out of town and looked at the faces of the audience from in town. As they went out she said, "Well, I see I've got to move again."

The "new democracy" appeared at Memphis, not as a program topic for discussion but as an issue live enough to concern very pointedly the conference organization itself. For the committee on nominations submitted a recommendation for a radical change in the method of electing the president and the conference voted to have a special committee consider and report next year on ways in which the rank and file of the membership may express more directly and definitely its preference for president. And in the sessions of the National Federation of Settlements a vigorous discussion arose over the relations of trustees to residents in the control of settlement policies and activities.

Dissatisfaction with the present method of choosing the conference president was apparent in a twofold way. Some of the public charity officials complained that the conference had come under the domination of a "charity trust" with an "interlocking directorate" of leaders in the field of voluntary effort. They contended that the public officials were not getting a square deal, that in ten years only one president had been chosen from the group.

This complaint was very effectively answered by the fact that of this year's nominating committee all but two were public charity officials, and by the applause which greeted the reading of the names of the presidents of the last decade representing North and South, Catholic, Protestant and Jew, public and volunteer workers.

Entirely distinct from this complaint was the dissatisfaction of the nominating committee with the present method as seeming to give ground for such a complaint to arise. It saw that the present method, under which the conference votes on the adoption of the report of the nominating committee immediately after the report is rendered, gives no time for members to consider the report or whether they may desire to make nominations from the floor. Throughout the membership there was almost unanimous feeling that twenty-four hours should elapse between the report and the action of the conference upon it.

Recognizing that "a sentiment exists that not sufficient opportunity is afforded for individual choice in the selection of officers," the committee recommended

THE BALTIMORE CONFERENCE of 1915

Officers

President.
Mary Willcox Glenn, New York.
Vice presidents.
Rev. John A. Ryan, Minnesota.
F. J. Sessions, Iowa.
F. J. Mastin, Virginia.
Members of Executive Committee.
Harvey H. Baker, Massachusetts.
Edwin D. Salenbarger, Pennsylvania.
Louis Bernatrin, Missouri.
Frances Ingram, Kentucky.

Committees

CHILDREN—Chairman, C. C. Caustens,
Massachusetts; **vice chairman, Henry W. Thurston,** New York.

Subjects—Program for child care,
state, county, city.
Relations of public and
private agencies.
Social and health responsi-
bilities of the school.

COLLECTIONS—Chairman, J. T. Ginder,
Pennsylvania; **vice chairman, Frank L.**
Randall, Massachusetts.

Subjects—Employment of prisoners.
Compensation of prison-
ers and their families.
Indeterminate sentence
and parole.
Penal farms; vagrancy.

PUBLIC AND PRIVATE CHARITIES—
Chairman, George S. Wilson, District
of Columbia; **vice chairman, Charles**
R. Henderson, Illinois.

Subjects—Chartering and super-
vision.
State subsidies.
Outdoor relief.
Relationship of public and
private charities.

FAMILY AND COMMUNITY—Chairman, R.
M. Little, Pennsylvania; **vice chair-**
man, Ancha Seiss, Illinois.

Subjects—Interrelations of case
workers in family treat-
ment.
Unemployment
inbreeds.

STATE CARE OF INFANTS—Chairman, Dr.
Walter E. Fernald, Massachusetts; **vice**
chairman, Dr. Owen Copp, Penn-

sylvania.
Subjects—Defective delinquent.
Institutional care and
treatment.

EDUCATION FOR SOCIAL WORK—Chair-
man, Porter R. Lee, New York; **vice**
chairman, Edith Abbott, Illinois.

Subjects—Training the professional,
volunteer, the commu-
nity.
Social research and survey.

HEALTH—Chairman, Dr. Richard C.
Cahot, Massachusetts; **vice chairman,**
Dr. Charles P. Emerson.

Subjects—Medical and social rela-
tions.
Social responsibility of the
hospital.

SOCIAL LEGISLATION—Chairman, Henry
R. Senger, New York; **vice chairman,**
John R. Commons, Wisconsin.

Subjects—Taxation reform as it re-
lates to congestion and
poverty.
Social insurance.

SOCIAL HYGIENE—Chairman, Martha P.
Fulmer, Pennsylvania; **vice chair-**
man, Dr. William T. Snow, New York.

Subjects—Luck of honest officials.
Political influence
Difficultly in getting evi-
dence required by the
courts.
Unsatisfactory disposition
in court cases.
Failure of public support
of law enforcement.

the following plan: committee on nominations to be appointed by the president as at present; three nominees for president to be reported by it not later than three days before the close of the conference; members of the conference to vote by ballot on these nominees on a day designated by the nominating committee; the balance of the ticket to be submitted by the committee as at present, after the result of the election of the president is declared.

This plan was vigorously criticized on two grounds—that it was not democratic enough in that only members present at the conference would have opportunity to vote, and that it would inject into the conference electioneering, which everyone felt would be unfortunate. A further point against it was that each year there would be present a large proportion of new members from the conference city, unacquainted with the traditions and methods of the organization.

Some of the members felt that these objections would be overcome and a better method provided if there were held each year a few weeks before the conference a preferential vote, members being asked to fill in a ballot giving the nominating committee their first, second and third choices for president, this vote, however, not to be binding on the committee.

These members also felt that an underlying cause for dissatisfaction exists in the present provision whereby all ex-presidents of the conference are members of the executive committee.

Without considering any of these suggestions, the recommendation of the nominating committee being the only one actually before the conference, it was voted that the president appoint a committee to report next year on various plans for giving the members of the conference larger participation in the choice of officers. Members were urged to submit their views and suggestions to this committee. A resolution was also passed requesting the president to appoint in the near future the nominating and organization committees for next year and to urge the nominating committee to utilize such means as it sees fit to take the entire membership into its councils.

Some sentiment arose favoring a change of name, and a resolution was introduced that the body be called the National Conference of Social Betterment Agencies. This resolution was also referred to a committee to report next year.

The race question was among those present, though it bore no credentials as a delegate. A Negro woman from Illinois was refused registration in the National Conference of Charities and Correction by a clerk employed by the local committee, until Graham Taylor peremptorily ordered that her name be entered. The sessions of the Southern Sociological Conference were adjourned from the Orpheum theater to a white church in order that the Negro members

might sit on the main floor with their fellow members.

And a front attack was made on both the national and the southern bodies by the National Association for the Advancement of Colored People. W. E. Burghardt DuBois, Ibel E. Spingarn of New York and Prof. William Pickens of Talladega College spoke at a meeting advertised in the papers for "all persons who love the truth and dare to hear it."

Dr. Spingarn, who was formerly a member of the faculty of Columbia University, declared that the movement for the protection of the black man from exploitation could expect no assistance whatever from the "social uplift" forces which were assembled in Memphis.

"The social workers of today," he declared, "occupy the same obstructive position on this problem that the church

the situation of the Negro farmer is not essentially different from that of the white; that comfortable houses, rich fertilizer, intelligent farming, proper tools, a little ready cash and good schools have precisely the same effect on both races. He carried conviction, too, in his emphatic statement that, for the rural Negro, the recent prohibition laws have been exceeded in importance only by the emancipation proclamation.

And white men, from North and South, joined heartily in the rolling waves of applause—and of southern song—which greeted him from the colored members and audience of the Southern Sociological Conference. Like a prophet, not of his people but of the South, Dr. Washington outlined the future of the Negro race. He disposed of the old objection that "niggers can't take care of themselves" by asking the audience how often they had seen a black hand extended on the street for charity. He demanded justice for the Negro, because not only the progress of the black man is stifled by ignorance and vice, but the progress of white folk, too, since science has proved how environment stamps the character of the individual.

Two other Negro speakers brought by the Southern Sociological Conference left lasting impressions.

One was Major R. R. Moton, the commandant of cadets at Hampton, who was described by a southerner present as one of the biggest and blackest and best of Negroes. Giving all due credit to the white race for what it has accomplished, he would rather be a Negro today than a white man, he said, for the backward condition of his race gives the Negro leader opportunities for service that no white man is offered by the white race. The backwardness of the Negro is the exact measure of the Negro leader's opportunity. Booker Washington, he said, had a greater opportunity than Woodrow Wilson. The other was Dr. C. V. Roman, a witty colored physician of Nashville. He contended that real religion is a tremendous force for health and hygiene, and called on the record of venereal disease to prove it. He gave his audience a sentence that was repeated over and over again during the conference: "Renounce the impossible and co-operate with the inevitable." A southern white woman, a social worker, confessed that never before that evening had she heard a Negro speak in public, nor heard of Dr. Roman, though she, too, came from Nashville.

If the conference as a whole, or in any large part, thought of race problems it did not give evidence of it. The conference was there to discuss social problems, and the Negro, halving the population, was a big factor in them.

And the things the conference actually saw and heard were interesting. There was the Southern Congress with its black members and speakers; the Memphis Associated Charities with its Negro committee an inviolate part of the organized charity that serves the whole community, but raising part of its own funds and proceeding by action of its own committee.

REV. JOHN A. RYAN
Of St. Paul Seminary, first vice-president of the conference

workers occupied during the days of Garrison and Phillips. They are opposed to any discussion of the fundamentals of the race question because they are afraid that it will offend the South, and check their own timid propaganda.

"If you go to a social worker who is interested in stopping child labor and you suggest to him that the labor of Negro children in the fields ought to be stopped, he says, 'hush, hush!' and in visible alarm shuts carefully his office door."

Many of the "social uplifters" heard the speech, though this meeting was entirely apart from their big group of conferences. But they heard, too, other speeches by and about Negroes that stuck in their minds as some of the big outstanding features of a solid week of good speaking.

Booker T. Washington, before the National Conference of Charities, carried strong conviction of his point that

Children

The committee on children catered to a variety of interests in its program, from infant and child hygiene to the outlining of a comprehensive plan of state legislation affecting children. One session was given up to protective societies, and another to the organizations that care for dependent children, while the general session dealt with the promotion of child hygiene, the prevention of child labor, and the improvement of elementary education in their relation to the conservation of the child.

In her *Suggestions for Teaching the Hygiene of Childhood*, Dr. Frances Sage Bradley of Atlanta recommended the holding of children's health conferences in connection with schools, churches and other organizations, to meet the needs of the great mass of ordinary children who stand between the delicate babies benefited by the baby clinic and the exceptional children of the prize baby contest.

The special need of the rural child was considered from another point of view by C. C. Carstens of Boston in a section meeting given up to the consideration of the newer methods of children's protective work. The moral conditions in the small towns and villages and in the country are frequently deplorable, and any social agency entering the rural field must be prepared to carry on all the varieties of work divided in the cities among many.

Roy Smith Wallace of Philadelphia took up the new spirit of the work of protective societies in cities and emphasized the fact that the progressive societies of this class no longer regarded their chief task as the rescue of the child from intolerable home conditions, but rather the treatment of the family as a whole, and the rehabilitation of the home, if possible.

Standards of Efficiency in Child Care was the topic considered from the points of view of care in institutions, by Charles H. Johnson; in boarding homes, by Edwin D. Solenberg; and in free family homes by Wilfred S. Reynolds. Mr. Johnson urged every institution to ask itself the searching questions, What does this particular institution stand for?—What is its educational, social, moral and economic value to the community?

Mr. Solenberg considered that boarding children in family homes combines many of the advantages of both institutions and of placing in free homes, giving the child the advantage of home care under the supervision and control of the agency responsible for the child.

Mr. Reynolds described the natural reaction that had occurred in recent years against the placing-out of all sorts and conditions of children in free homes.

The discussion brought out a strong feeling of opposition on the part of many delegates to the placing of children in states at a distance from the placing organization's central office without much more careful arrangements for responsible supervision than have ordinarily been in vogue.

MARY WILLCOX GLENN

President of the 1915 National Conference of Charities and Correction.

Roger N. Baldwin of St. Louis, in answering the question, *How Shall We Frame a Consistent Public Policy for Children?* pointed to the chaos now existing in the various states in the standards for the education and protection of normal and abnormal children, and advocated the preparation of a model state children's code.

Such a code should include the protection of the birth of children by eugenic regulations, legislation regarding employment of mothers before and after confinement, the reporting of births, and the regulation of midwifery, relief to poor mothers, support from fathers for illegitimate children, compulsory education laws, state wide educational system, provision for comprehensive juvenile court system, provision for the relief of destitute children, and state supervision of child-caring agencies.

At the general session of the children's committee the topic of the Conservation of the Child was treated under the three heads of the promotion of child hygiene, the prevention of child labor, and the function of the school.

Sherman C. Kingsley of Chicago pointed out that the causes of death and disease in later life were being increasingly traced back to the neglect of child hygiene, that the mortality in the

first year of life was so great as to rank infancy with the extra-hazardous occupations, and that only by putting into practice our present knowledge of child hygiene can we lay firm foundations for the health of the race.

Professor W. K. Tate of the George Peabody College for Teachers wanted rural social centers in the South consisting of groups of workers, including the teacher, the minister and the visiting nurse centering about the school house, with a practice farm in connection.

A. J. McKelway reviewed the achievements of ten years of child labor reform, calling attention to the fact that it was the Atlanta conference of 1903 that marked the beginning of the new era for social reform in the southern states, and that at this conference the late Edgar Gardner Murphy, of Alabama, made his eloquent appeal for the treatment of the abuse of child labor on broad national lines. In 1904 the National Child Labor Committee was organized, and now every state in the Union has some legislation protecting its working children. But in only a few states is there adequate provision made for the employment of sufficient inspectors to enforce the laws. The federal bill now pending in Congress is looked to as the means of effecting a great and permanent reform of these conditions.

Families

The committee on the family and the community was charged with the duty of considering several interests in its program—those of charity organization work, rural improvement, and the relation of business to philanthropy.

All of these were presented at the Sunday evening general session. The report of the committee on Charity Organization Ideals presented by the chairman, Eugene T. Lies, general superintendent of the United Charities of Chicago, was a defense against the critics of organized charity and a vigorous portrayal of the development of this field. It was shown that in this day of many social movements the hard won experience as to method and goals of the charity organizations offered guiding lines for all.

Edward T. Devine's paper on Philanthropy and Business traced the evolution of the idea of human welfare within the commercial and industrial field. It will be published in full in a later issue of THE SURVEY.

Sophonisba P. Breckinridge of Chicago gave an illuminating picture of a family set down in one of our large cities, borne down upon by scores of influences, handicapped by racial and national reservations of all sorts. An incisive yet broad sympathy was shown to be necessary if the real state of the family group was to be understood and bettered.

Clarence Poe, editor of the *Progressive Farmer*, captivated the audience with his plea for a discriminating understanding of the problems of rural life. He pictured the serious lacks of ordinary social opportunities in many country districts both North and South.

The Culture of Family Life was treated from the religious, the recreational, the correctional, the settlement worker's and the charity worker's standpoints. These discussions and indeed all the papers presented at the different meetings of this section emphasized the fundamental importance of the family group as the center of our social life. This group needs intensive study from all sides by social workers. Being pulled upon from the exterior as never before, its relationships to every phase of environment require keen diagnosis if rehabilitation plans are to be of any value.

Prof. John L. Coulter pointed out that the roving farmer was one of the great hindrances to community betterment and to personal and family betterment. Ever on the move, he cares nothing for the development of health facilities, co-operative marketing and the like. He does not improve his skill for he has only small interest in results. His children, shifting from school to school, are at a great disadvantage. Not only farm ownership but long tenantry would be a solution.

Booker T. Washington, in a strong address on the Rural Negro in the South, prescribed better housing, regularity of pay to employes, better schools, better police protection, measures for increasing efficiency, and abstinence from liquors as six of the most important helps for the farm Negro's welfare. Seven million out of nine million Ne-

groes in the South are on farms. Without them, southern farming could not be carried on. Ownership of farms by Negroes has increased between 1900 and 1910 from \$177,000,000 worth of property to \$492,000,000 worth, representing twenty millions of acres of land. Dr. Washington believed simple rural life rather than complicated city life, and remaining in the South, are the best things for the Negro.

A thorough discussion of family rehabilitation work was had at the final session of this committee. The subject was treated from the mental and the moral side; from the standpoint of southern conditions, with reference to racial and national characteristics and efficiency of charity workers. "Know your family, detach it from the large groups, see it on all sides as a composite," was the counsel that predominated in each speech.

Neighborhoods

The large place of recreation in the movement toward democracy was the main emphasis of the committee on neighborhood development. Right to leisure and use of leisure were considered in their bearing not merely on each individual's "pursuit of happiness," but on the development of citizens' and neighbors' faculties for knowing, trusting and working with each other—so essential in progress toward real democracy.

In the absence of Mary E. McDowell, Harriet Vittum, of Northwestern University Settlement, Chicago, served as chairman of the committee. The section meetings were devoted to very concrete and practical descriptions of how neighborhood development through recreation is actually going on in many communities, and the general session conducted by the committee was a notable discussion of "recreation and social progress" from the standpoint of the community, the settlement, the church and the school. Miss Vittum brought out impressively the overwhelming extent to which the community rather than the individual determines the social opportunities of everyone. She made her point vivid by telling the story of four young murderers who had grown up in the largest Polish colony of Chicago. "They did not choose the saloon for their social center," she declared, "the city chose it for them, by not providing something better."

A new point of view was taken by Clarence A. Perry in his discussion of social center work in the schools. He urged that while the schools are not serving the recreation movement by utilizing their plants as social centers, such activities are on their part rendering valuable aid to the primary purpose of schools—through humanizing and vitalizing school work.

The bad influence of the cheap candy store was convincingly described by George A. Bellamy of Hiram House, Cleveland. It is the poor child's club, he said, in the same way that "the saloon is the poor man's club." It keeps open late, encourages loafing, allows both sexes to congregate in demoralizing fa-

miliarity, and stimulates gambling through its "grab bags" with chances for prizes. It graduates its frequenters into pool rooms, which in turn pass the youth on to the saloon and vicious resort.

From providing such recreation as it can in its own plant, the church, said the Rev. Harry F. Ward, of the Methodist Federation for Social Service, must go on to the larger effort for giving recreative opportunities to all young people, through community facilities. It was pathetic, he said, to see rabbis defending gunmen when religion had failed to defend its own youth in the presence of the breakdown of community life. Recreation no more than education should be under church control; the state should provide it in the interests of better citizenship, and the element of private profit should be no more a factor than it is in education. The two great sins against children, Mr. Ward declared to be child labor and commercialized play.

The character-building value of recreation was emphasized and Mr. Ward sentimentiously remarked that if you want to know how religious a man is watch him, not listening to a sermon but playing a game of golf or going camping.

The church's contribution to the recreation movement is to make clear its religious values and necessity. The soul and spirit of a people are shown in two forms of association—worship and play. If we can learn as a people to play we shall be creating new forces of life for the people.

Corrections

One of the greatest of American problems, that of the misdemeanant or short-term prisoner, the one who receives a jail or workhouse sentence, was discussed by the committee on corrections. The report of the committee by Amos W. Butler, of Indiana, the chairman, dealt with the treatment of the misdemeanant covering the ground from his arrest to his release from imprisonment. The report quoted statistics from a special bulletin of the Census Bureau to the effect that nearly a half million persons are committed to county and municipal prisons in the course of a year, under sentence or for non-payment of fine. The jails where they are confined have been termed training schools in crime; the fee system leads to great abuses; the idleness in local institutions is demoralizing and degenerating; the police are dominated by politics. While prison reforms are coming with surprising rapidity, they have been confined largely to the felon. The misdemeanant has been neglected.

The program of the committee was designed to bring out the newer thought which has led to humanizing the courts, to giving the prisoner an opportunity to earn the money to pay his fine and costs and make restitution for his wrongdoing; to release on probation; to the colony or farm system of outdoor employment; to the indeterminate sentence and conditional release on parole under proper supervision.

It was brought out that most of the

reforms advocated by the committee are in actual operation somewhere. It but remains for the states to seek them out and profit by the experience gained.

Judge James A. Collins told how, as police judge of Indianapolis, he carried out his aim of administering justice tempered with humanity. Of 7,500 misdemeanants in whose case he suspended judgment, less than three per cent were returned for a subsequent offense. In four years he succeeded in reducing jail and workhouse commitments fifty per cent.

Splendid success under the probation system in Massachusetts was reported by Edwin Mulready. Judge Bacon of Memphis endorsed the newer methods. Dr. W. H. Oates described a remarkable transformation in jail conditions in Alabama as a result of state inspection and a certain degree of state control.

But of all the reforms in the treatment of the misdemeanant that which attracted most attention was the state farm, as described by W. H. Whitaker, superintendent of the District of Columbia farm at Occoquan, and by Dr. J. T. Gilmore who has charge of the farm at Guelph, Ontario. At Occoquan there are 1,150 acres of land and varied industries are operated by the prisoners. The average sentence is 35 days. The farm at Guelph is smaller, but is operated along similar lines. At neither place are locks and bars and weapons found necessary. The whole treatment is a complete departure from old-time methods, and its results are infinitely more effective and humane.

That outdoor employment is possible for women as well as men was brought out by other speakers. Dr. Edith Spaulding of Massachusetts, and Martha P. Falconer, of Pennsylvania, told of advance steps in eastern states in the treatment of women misdemeanants. Mrs. Falconer emphasized the advantages to be gained by having women officers over women offenders and by maintaining them absolutely apart from delinquent girls.

One of the meetings of the committee was given over to a consideration of outdoor labor for state convicts. Virginia's experience in employing prisoners on public roads was described by Major J. B. Woods, superintendent of the Virginia Penitentiary. Whatever may be said of its success from a business viewpoint, Major Wood impressed upon his hearers that road work does nothing to reform a prisoner; that it is unfair to subject him to the temptation of killing the guard when the only thing between him and freedom is the guard's suit of citizen's clothes; that not all prisoners are suitable for road work; that the death rate is higher in the camps than in the prison; that above all the state cannot afford to return a prisoner to his community, at the end of his sentence, with nothing but a suit of clothes and transportation home.

Similar views as to road work were expressed by Prof. C. S. Potts, of the University of Texas who deplored the lack of a reformatory of the Elmira type in Texas, though the state has a series of penal farms.

Defectives

At the general session of the committee on defectives the committee report was chiefly concerned with a few of the more recent developments in the field of mental hygiene. These included the advance of scientific methods of testing mental defects—in the public schools, where it has helped to bring about the special classes for backward and defective children; in the reformatories and prisons, where it has made evident that an important minority (and in some cases an actual majority) of delinquents, especially the juveniles, are really so defective as to be irresponsible,

THE GOAL OF PRISON REFORM

Set by the section on corrections

A system of police, recognising character, merit and efficiency in the personnel and a proper social view for its operations.

A prompt hearing for every person arrested.

The establishment of juvenile courts for all children's cases.

Provision for the care and detention of delinquent children outside the jail.

A probation system for adults similar to that of juvenile courts.

Separate trials for women offenders.

A modification of the present system of fines in order not to discriminate against the poor.

Classification of prisoners, confinement of individuals apart from each other and absolute sex separation in county jails.

The prohibition of the use of the jail for any other purpose than that of temporary detention.

The abolition of the fee system.

State control of all minor prisons.

The establishment of industrial farms for convicted misdemeanants.

A form of indeterminate sentence for misdemeanants.

Their release on parole under supervision.

The abolition of contract labor.

incapable of reformation, unfit subjects for punishment and therefore unfit persons to be turned loose on the community; and in the courts, where it has given the judges a basis of knowledge of the culprits before them which has hitherto been lacking.

The work of the National Committee on Mental Hygiene has aroused attention to the fact that epilepsy, insanity and feeble-mindedness are really three closely connected factors of one great problem. This has been emphasized by the reports of several recent state commissions on provision for the mentally defective.

The colony plan, first presented to the conference at Indianapolis in 1891,

which is the practical method of segregated care for the feeble-minded and epileptic, is being generally accepted, not only for them but for many other classes. Several present experiments with economical industrial communities of the kind were briefly mentioned.

Sterilization, which has been made legal in thirteen states, declared unconstitutional in one, and found in accord with the constitution in another, but which so far has been little used, whether wise or not, was held to be too far ahead of public opinion to be largely practicable at present.

Segregation, on the other hand, is rapidly gaining public approval. It needs only to be understood to be accepted everywhere. That a colony, as the permanent home of the trained imbecile and moron, is not life imprisonment but on the contrary gives them the happiest and freest life that is available for them, needs to be popularized everywhere, as being best for the defectives and immensely the best for the community.

A valuable paper on the Psychical Study of Juvenile Delinquents, which deals also with some of the adults, was presented by Dr. Healy, whose long experience with the psychopathical institute attached to the Juvenile Court of Chicago, makes his word on such a topic almost the final one.

Then the chairman of the committee, Alexander Johnson, illustrated the training and subsequent care of the feeble-minded by a series of stereoscopic pictures. He showed specimens of the three main types—idiots, imbeciles, morons; also some of the less frequent, such as cretins, mongols and moral imbeciles.

There were two section meetings, the first given to the causes of insanity. Dr. Fox of the Mississippi State Hospital showed the dire consequences of syphilis as it attacks the brain. He claimed that over the door of every resort of vice might be inscribed: "Incurable insanity may be acquired within."

Alcohol as a cause of insanity was treated by Everett S. Elwood of New York. That it is the chief cause in a large proportion of cases and a contributory cause in a much larger number was asserted.

The second section meeting continued the topic of Defectives in the Juvenile Court from the viewpoint of the bench. Judge Addams of Cleveland told of the help the courts are receiving from the psychologists who are now among their most efficient aids. He praised the Binet scale as a useful measuring device, discussed the value of the probation officer with the border line cases, whose proper disposition is often doubtful and throws back upon the judges the duty of serious inquiry as to the mental status of accused persons, especially juveniles. Judge Addams said that while in large cities it is usually easy for the judges to secure the expert assistance of a trained psychologist, this is not true in the smaller communities.

A new plan adopted in Ohio obviates this difficulty. By this plan all children

who must be taken in charge by the state, instead of being sent by the court to a particular institution are committed to the care of the State Board of Administration. Then they are examined and studied and thereafter dealt with as their condition requires, whether that means placing in an institution or otherwise. The control of the board follows them so that if a mistake is made it may be corrected easily.

Judge Addams favored supplementing the Ohio plan, so far as the defectives go, by the New Jersey plan of special classes for defectives in the public schools, with assistance from the state in defraying the increased expense to the school system. This plan, he said, not only insures the proper teaching but makes it to the advantage of the local authorities to find the children who need it.

Outside the meetings of the committee on defectives references to feeble-mindedness were numerous at the conferences. In the reports from states it was the exception when the reporter did not voice the urgent need of more and better care for this class. The conclusion was irresistible that the present is the psychological moment for a nation-wide campaign on behalf of the mentally defective and on behalf of the community, by means of caring properly for them.

Living and Labor

Fresh evidence of the life and energy of the section on standards of living and labor manifested itself at its evening session when Jean Gordon and Dr. McKelway dealt with protective standards for women and children, the Rev. E. V. O'Hara reported the unique and creative work of the Oregon Industrial Commission, and Lewis W. Hine closed with his pathetic pageant of laboring children, North and South. It was an informing and inspiring series of appeals for a national standard of justice in industry. It was cheering because of the year's achievement. It was an impressive evening despite the absence of the chairman, Charles P. Neill, called to West Virginia by the mine disaster at Eccles, and of Jane Addams who was to have been the last speaker.

Of national importance are Father O'Hara's tidings of a second favorable decision sustaining the rulings of the Oregon Industrial Commission establishing minimum wage rates for women in manufacture and retail trade. In this the chief justice of the Supreme Court reviewed the whole subject and the court unanimously adopted his view. Upon this doubly solid foundation the Oregon law rests in the test case now pending before the Supreme Court of the United States. For the year 1914 the minimum wage for an adult clerk in a department store in Portland is \$9.25 a week; in a factory any adult woman must be paid not less than \$8.64 a week (16 cents an hour, with a working week limited to 50 hours). Outside of Portland, where the cost of living is lower than in the rest of the state, the minimum rate is \$8.25 a week.

The striking feature of the Oregon

law, wherein it differs from all previous legislation in all parts of the world, is the declaration that it is not for the welfare of the state that women and minors should be employed excessive hours, or paid a wage that cannot maintain them in health and decent comfort. From this declaration in the statute the Industrial Welfare Commission and the courts have logically deduced every step that they have taken.

Of national importance, too, were Mr. Hine's pictures of New Orleans mill children and messenger boys. For what Jean Gordon has accomplished in that southernmost city of the Mississippi valley can never be convincingly shown to be impossible elsewhere. Standards of age and size are set, once for all, in those photographs from which there is henceforth no appeal. In this one respect the pathetic pageant of child laborers becomes a substantive, scientific contribution to the standardizing of working children throughout the South. What has been done can be done, is the new slogan for every state which is not yet enforcing up to the hilt a bona fide fourteen-years age limit. And where, except in Orleans Parish is such a limit so enforced?

The section meetings were devoted, one to social insurance and the other to agencies for establishing and maintaining standards of living and labor. In the latter Prof. Charles R. Henderson of the University of Chicago discussed the Right of the Worker to Social Protection, and Frederick Hoffman, statistician of the Prudential Insurance Company speaking of American Problems in Social Insurance defined his position as a hostile critic of mothers' pensions.

In this section, too, John B. Andrews, secretary of the American Association for Labor Legislation, reviewed the three methods generally employed for obtaining better standards of living and labor. The first, guerilla warfare as practiced by the syndicalists, Dr. Andrews described as "able to give dramatic expression to the cry of the oppressed masses, but unable or unwilling to maintain standards." Collective bargaining, the second method, while protecting the gains made by trade unionists, ordinarily gives no assurance that the interests of the general public have been taken into account. The legislative method, Dr. Andrews maintained, combines from the general public welfare point of view most of the desirable features of an agency for establishing and maintaining just standards of living and labor.

In considering voluntary agencies, Mrs. Florence Kelley's thesis was the need of establishing, in all possible places throughout the nation, local branches of those agencies which are represented in the conference. While churches and women's clubs can reasonably be called upon for co-operation in the general work of education, the actual performance of continuing difficult tasks of philanthropic work cannot be left to them without ensuing failure. There is need of an organized group, even though small, in steady communication with the national office of its own

particular agency, helped by the national organizers, instructed up-to-date as to the changing phases of pending federal legislation, and the progress of kindred work in other states. As reverberators of slogans the clubs are invaluable. But what continuity could be hoped for from that Mississippi Valley State Federation of Women's Clubs which once voted that, for the next five years, it would not consider the same subject or invite the same speaker twice?

No livelier discussion occurred in any section meeting, than at this one, a striking contribution being Father O'Hara's two minutes statement that, in order to go forward securely in the path of progress, it is necessary to have the initiative, the referendum, the direct primary, the recall and woman suffrage—"which constitute the Oregon system."

Public Charities

David F. Tilley, member of the Massachusetts State Board of Charity, presented as chairman the report of the committee on public charities. He dealt in a general way with the functions of state boards of charities, the need of co-operation between state boards and the other agencies and an informal report upon the present needs of various states as indicated in reports made during the past year to the committee.

The most pressing needs were shown to be for better provision in the care of juvenile delinquents, with special provision for the feeble-minded; more uniform laws for the care of delinquent and dependent children, for the treatment of vagrants and for some better provision for dealing with the feeble-minded of both sexes.

Haphazard methods of legislation were condemned and the speaker said that the workers in the various states had much need of protection from legislative action, which is subject to deserved criticism because laws are enacted without proper investigation or without understanding of the real social needs of the various states or communities based upon accurate, painstaking and thoughtful investigation.

The state board of charities should be depended upon for such information, he said, but they cannot furnish it if they are without authority to make the needed investigations, both in their own states and to acquire information as to existing conditions in other states.

Among the recommendations made by Mr. Tilley for the committee on charities, were that grounds for commitment to state institutions be made uniform so far as possible in the various counties of each state. He suggested that courts and lawyers, especially magistrates and justices, be kept informed by state boards.

Robert W. Heberd, secretary of the State Board of Charities, of the state of New York, read a paper on Uniform Settlement Laws which will be printed in full in the proceedings of the conference and will serve as a handbook on this subject.

John H. DeWitt of Nashville discussed the Present Charitable Needs of the South. He prefaced his remarks

with an explanation for the benefit of visitors, of the double burden which rests upon charitable workers in this section because of the large Negro population.

He presented three important subjects which need remedying: the almost universally bad condition of jails and almshouses, the treatment of delinquent boys and girls and the need of better organization of state boards of charities in almost every southern state. He spoke of beneficial changes in jail methods recently made in Virginia and other states, like Mississippi, where the convicts are worked upon farms. He called attention to the boys' training schools established in Tennessee and might have mentioned the fact that Shelby county, in which the conference met, has begun many reforms in its county poorhouse and workhouse farms.

He recommended that departments of state charities, laid out upon a broad, comprehensive system be established in every southern state.

A joint session of the committees on public charities, children and the family and the community was devoted to Adequate Relief to Needy Mothers. Throughout the conference there had been divergence of opinion in regard to widows' pensions. This session differed from similar ones at earlier conferences in the number of states reporting pension laws in operation—Massachusetts and Pennsylvania in the East, and whole groups in the West. Mr. Hebbard announced that the New York State Commission will introduce a pension bill again at the next session of the Legislature.

Social Hygiene

The program of the social hygiene section was devoted largely to the problem of prostitution, and included the following major divisions: mental and physical factors and social causes of prostitution; factors in prevention of prostitution, awakening of a new public conscience and development of educational methods; the treatment of the problem, including the special treatment of women offenders; and reports upon administrative methods now being tried and results thus far achieved.

The dominant note of the meetings may be summed up in steady repression of prostitution through every available means and condemnation of the policy of segregation, education of the adult public, particularly of parents and teachers, protection and when necessary segregation of the feeble-minded, medical diagnosis and hospital care for venereal diseases, and study and control of environmental factors.

Concerning the latter, Mrs. John M. Glenn, president-elect of the 1915 conference, said: "The inability of the family to protect its adventurous members, the readiness with which standards of conduct fall under the impress of impersonal contacts, the losing struggle of the home to safeguard its young in competition with the paltry offerings of the street, the meagerness of the education for home-making, the difficulties of adjusting people of markedly different

racial habits, the loss of traditional sanctions, ignorance of the laws of sex, faithlessness to marriage vows, demoralizing work conditions, poor pay, the home that is a sham, the home that is broken, the inability of the feeble-minded to protect themselves, the readiness with which in both city and open country stagnant centers of pauperism and crime are allowed to breed their kind—each of these can be seen to have its part."

All of the papers were illustrated with statistical data showing the importance of each of the factors discussed and the proceedings of the conference will be valuable for reference material on the subject. There was a disposition, however,

THE FUNCTION OF MORBIDITY STATISTICS

From a paper before the Health Section
by Dr. John W. Trask, U. S.
Public Health Service

The reporting of communicable diseases that the people may be protected from typhoid fever, tuberculosis, diphtheria, et cetera.

That the sick may get proper treatment, such as anti-toxin for diphtheria, and attention in tuberculosis.

That non-communicable diseases of occupational and local origin may receive attention as to cause.

That the geographic distribution and other features of diseases of unknown origin may be studied, as in pellagra, cancer, et cetera.

That the need of certain sanitary local measures may be demonstrated, such as draining for malaria, better housing for tuberculosis, improved sewage disposal and pure water supply for the control of typhoid fever, hookworm, et cetera.

on the part of the delegates to concede the importance of all these factors and to get down to the practical discussion of a constructive campaign of reduction and gradual eradication of prostitution. Interest especially centered in ways and means of eliminating segregated districts and tolerated centers of vice in cities. The report of the committee on social hygiene presented by the chairman, Maude E. Miner of New York, emphasized the fact that fourteen vice reports thus far published unanimously declared against segregation and for the practicability of active repression. The report endorsed this position and outlined the practical steps in promoting its adoption and in developing agencies for minimizing the supply of and demand for prostitutes.

President Graham Taylor made a strong plea at the general meeting for the policies advocated in the report, basing his argument on his experience and knowledge of the vice investigations and work of the Chicago Vice Commission.

James Bronson Reynolds, counsel of the American Social Hygiene Association, presented a convincing argument of the same tenor. Rabbi Berkowitz presented the educational need for sane sex education, at the same time emphasizing the importance of applying the policy of "repression" to the many unwise and harmful methods of teaching and exploiting sex information which are being tolerated at the present time.

Martha P. Falconer's discussion of corrective institutions attracted one of the largest audiences of the conference, and gave many present an entirely new conception of the importance and possibilities of real correction work, both for the welfare of the individuals and of society. The reports of Frederick H. Whitin on the work of the Committee of Fourteen, New York, in enforcing laws against disorderly hotels, and of Zenas Potter on treatment of offenders before trial, created much interest.

The continuation of the section under the chairmanship of Mrs. Falconer, of Sleighton Farm, Darlington, Pa., is fortunate. The serious study of the complex problems of the social hygiene movement by such national bodies as the National Conference of Charities and Correction promises to rescue a most important field of social welfare from impractical theorists, medical charlatans, and others who have already done much damage through their efforts.

In addition to the regular program, the committee presented an interesting exhibit in connection with the paper on social hygiene exhibits by Dr. William F. Snow, general secretary of the American Social Hygiene Association.

Health

Dr. Ennion G. Williams of Richmond, Commissioner of the Virginia State Board of Health, opened the health section, of which he was chairman, with the statement that the highly organized cities are meeting their health needs in large measure; but the rural sections lag far behind. The country districts are not organized for health and their death rates remain stationary or increase while death rates in the cities are steadily going down. The machinery of the state boards of health is inadequate to meet rural needs, he said.

One of the most hopeful movements looking toward meeting the rural problem is the recently organized Red Cross Town and Country Nursing Service, described by Fanny F. Clement.

Miss Clement told of how the nurse tacked up netting in the windows against flies and mosquitoes; how she stimulated the people of the community to cheer the "shut-ins" with flowers and birds and magazines; to fix up springs and wells and privies; and how she became the ministering spirit of the country-side—the social servant, unofficial health officer, preventer and arbiter of trouble of every kind.

In the discussion following Miss Clement's paper, instances were cited as to the ease with which a number of communities in Virginia were organized and raised money enough within a few

(continued on page 248.)

THE COUNTY

A Challenge to Humanized Politics and Volunteer Co-operation

President's Address, National Conference of Charities and Correction

NO greater transition in the tendencies of the times has faced the National Conference of Charities and Correction in the forty years of its experience than that which confronts us who have entered upon the fifth decade of its survey and service. It is the tendency to entrust to public administration and support humanitarian functions which for most of the centuries were recognized as the exclusive prerogative of religion and are still for the most part fulfilled by volunteer agencies in and outside of the churches. Any present transitional tendency is more quickly and better understood when it has some counterpart in the past which affords at least background to furnish perspective and sense of proportion. Arnold Toynbee's advice to read history with present problems in mind is as effectual when reversed and we try to read the present with history in mind.

The Chartist movement in England seventy-seven years ago furnishes a prophetic situation predictive at least of some phases of present tendencies involving humanitarian needs and resources. Then as now the rising cost of living was rapidly reducing the standard of living. Then as now unemployment and dependency were resented as an injury to which charity added insult. Then as now the recognition of the right to live was taken to involve the concession of the right to work for a living. Then as now the righting of social wrongs was claimed to be the primary function of politics. Therefore the "people's charter" was demanded from Parliament then, just as the referendum and initiative and the recall are demanded of our legislatures now. Then the extension of the franchise to disfranchised men was demanded, as it now is to disfranchised women, in response to and in fulfillment of a new incursion of race consciousness. Then as now religion was stoutly held to be accountable both for this divine discontent and for its human satisfaction. Then began in Britain the modern Christian social movement, which now finds religious expression in every language and gathers force in many forms of faith.

Then it was that Frederick Denison Maurice gathered together the broken promises and the shattered hopes of his own troublous times in a prophecy of the humanizing of religion and of the religionizing of politics, which cannot be denied to be the most significant tendency of our times.

This is his prediction of the rise of politics for the people out of the denatured partisanship which has dehumanized government:

"Politics have been separated from

Graham Taylor

PRESIDENT, CHICAGO SCHOOL OF CIVICS
AND PHILANTHROPY

household ties and affection, from art and science and literature. While they belong to parties, they have no connection with what is human and universal; when they become politics for the people, they are found to take in a very large field: whatever concerns man as a social being must be included in them.

"Politics have been separated from Christianity; religious men have supposed that their only business was with the world to come; political men have declared that the present world is governed on entirely different principles than that. But politics for the people cannot be separated from religion. The world is governed by God; this is the rich man's warning; this is the poor man's comfort, this is the real hope in the consideration of all questions, let them be as hard of solution as they may; this is the pledge that Liberty, Fraternity, Unity, under some conditions or other, are intended for every people under heaven."

To whatever personal or political motives we may attribute the taking over of humanitarian functions by town and county, by city and state, we can scarcely fail to account for the country-wide, well nigh world-wide, movement to do so as an overflow of religion into politics, or at least as the state's assumption of the social results of the church's initiative. Certainly nothing could so impressively attest the fact that religion has builded better than it knew as to

find the state becoming more of a schoolmaster than the church, to find the county taking care of more sick and aged, widows and children, than the churches can care for; to find the city sheltering more homeless strangers than were ever found within the gates of the Christian hospice, protecting children exposed to their own or others' waywardness, doing justice and loving mercy, if not walking humbly before God.

But these very facts face both politics and religion with a serious challenge. Can politics become religious enough to fulfil these sacred humanitarian functions in the spirit and with the purpose of religion? Can religion imbue the people with an ideal and spirit of statesmanship that will be adequate to evolve the charity of today into the justice of tomorrow? If so, politics and religion must accept and meet this challenge at the one point where local government is loading up most heavily with human functions and yet is the most neglected of all our political units—the county.

In direct descent from the "shire," which is the earliest form of popular government, the county is our oldest political unit. As such, the primary and most essential functions of government naturally gravitate to it, except in New England and some sections of the South where the town and district precede and supersede the county. It is the most pervasive of all American local governments, covering the country in every state as the very warp and woof of the national fabric.

There were 2,952 counties in the United States reported by the census of 1910, five-sixths of them are rural, ten per cent of them having no incorporated municipalities. The 115 semi-urban counties, having an urban population of from 50,000 to 500,000, includes 13,000,000 inhabitants. There are eight great city counties having populations of 500,000 and over. The county is also the most prevalent political unit, not only permeating our whole legislative, judicial and administrative system, but being the mold in which our party organization is cast. Our machinery for nominating and electing officials is centered in the county, and the "county central committee" is almost everywhere the most active and potent of our party organizations.

In addition to these undergirding responsibilities, the county is invested with these specific executive functions which are quite as essential to all government: levying and collection of taxes, making and keeping open the ways of communication by constructing and maintaining roads and bridges, preserving order and administering justice through the sheriff's office, the courts,

justices and constables, and even by the militia in earlier times, protecting life through the coroner's office, managing and supporting schools, registering and recording deeds, wills and vital statistics, licensing certain sales, as of liquor, and legislating by the referendum for the restriction or prohibition of such sale.

To these governmental functions of the county there have been added, and with rapidly increasing volume of late, the relief of the poor, at the almshouse and at home through the county agent, by the funds to parents or widows' pensions; the care and cure of the sick in general hospitals and in sanitariums for tuberculosis patients; the custody of the feeble-minded, insane, and epileptic; the arrest, conviction and punishment of misdemeanants and criminals, and the custody and probationary care of juvenile delinquents.

The extensive and intensive work of the county, which, with varying form and degree, but of the same kind, is the prerogative of every county, cannot be better illustrated perhaps than by massing the overwhelming volume of Cook county's service to the people of Chicago and surrounding towns.

County Service

As required by law, it held last year national, state, county and municipal elections and primaries. It maintained the county building, ten stories high, occupying half a block, containing offices and the courts, and a criminal court building and jail occupying another half block; it constructed and maintained roads and bridges over an area of 993 square miles, excepting the 191 square miles within the city limits of Chicago.

It provided 1,400 teachers for 40,000 pupils in schools of the outlying towns.

It recorded all deeds determining the title of real estate and documents affecting the title to personal property for a population of 2,546,000 people.

It issued and recorded marriage licenses for 36,000 couples, and granted saloon licenses outside the city.

It levied, assessed, collected and allotted to the state, county and municipal governments an annual revenue of about \$47,000,000.

It served legal process and enforced court orders upon 191,469 persons.

It maintained the circuit court with 10,898 suits and 25,000 litigants, the superior court with 5,770 cases and 12,000 litigants, the probate court with 4,412 cases, the county court with 5,925 cases, the criminal court with 3,500 prosecutions.

It housed, fed and cared for about 11,000 prisoners in the county jail, nearly 10,000 of whom required medical treatment for infectious diseases.

It maintained public order in case of riots.

It gathered in, temporarily cared for and committed to state asylums or discharged 2,334 insane patients.

It assumed and maintained care for 10,597 delinquent and dependent children.

It isolated and stamped out contagion. It housed, fed and furnished medical

and surgical treatment for 34,000 sick people, 1,000 tuberculosis patients, and 3,000 aged, infirm, or irresponsible people.

It supplied food, clothing and fuel to about 200,000 persons; buried 978 pauper and friendless dead, and granted \$165,000 to 350 indigent mothers for the support of 1,126 children. To perform this service it required the full time of 3,000 employes and part-time of about 10,000 others. The appropriations of Cook county for 1913 total \$7,072,486.96.

The cost of county government and service is reported by the United States census to be in New England at the rate of \$.92 per capita, in the southern states \$1.20, in the central states \$2.30, in the western states \$6.25 and aggregating the total expenditure in all the 2,952 counties of the enormous sum of \$300,000,000 a year—nearly half as much as the national government costs.

The county seat is therefore the center of more governmental activities and human service than that of any other seat of government. It is the rural capital of a great majority of the American people, and is the executive office of many of the most important of the great cities' functions.

Coincident with the growth of its functions in diversity, human importance, administrative exactions and political power, the county has suffered from its own citizens' neglect, the consequent inefficiency of its officials and the partisan perversion of its prerogatives and powers.

This is everywhere evident in the carelessness, inaccuracy and illegality with which public records and accounts of the counties are kept; in the confusion, lack of co-ordination of its laws and methods of procedure in its relation to the city and the state; in the evil conditions prevailing in county jails, almshouses, provisions for dependent and neglected children and public health, which this National Conference has ever exposed and always sought to improve. The neglect of the county by voters, taxpayers and people is still more glaring than the inefficiency and corruption of its administration which is due thereto.

Sore Spots

This ignorance and indifference justify one of our foremost investigators of county affairs in declaring that "we are still, as a people, profoundly ignorant of the particular functions which the county fulfils in our national economy and, except in specific instances of graft, exposé, taxpayers' suits, and sporadic achievements in the line of research and reform, we are still at a loss to put our fingers upon the county's sore spots."

Nevertheless the spots are so sore that the secretary of the National Federation of Retail Merchants recently reported to the President of the United States that while the population of the whole country was increasing twenty-one per cent, no less than 217 of the 777 county seats in nine states, including New York and Pennsylvania on the

east, Missouri, Iowa and Wisconsin on the west, lost population, as have 6,956 of their towns.

Although this loss is attributed to the competitions with the great centers which cause the elimination of the small retail merchants, yet it is noted as surprising that it has taken place at county seats, which are "in many ways the center of most of the activities of the county unit along the line of politics, courts, collection of taxes, and in other directions. And strange to say, this tendency of the decline of the towns is greatest in the richest and most thickly settled parts of the states."

May it not be due in part to the citizens' neglect to promote their own interests by the development of the public resources and agencies of their rural counties? Still greater and more disastrous is the neglect of county government by the citizens of great cities just in proportion as its exactions, expenditures and human responsibilities increase to the maximum. Just there, where the most money, public welfare and personal suffering are at stake, good citizenship is weakest and partisan exploitation worst.

Causes of Inefficiency

There are in the county system itself very obvious causes for inefficiency in administration aside from the sheer neglect of the voters. Counties differ so greatly in their area—from 25 square miles to 20,490 square miles; in their population—from 5,000 to 2,500,000; in social and industrial conditions—from a scattered, native, farming community to the largest and most cosmopolitan manufacturing and commercial centers. Counties differ widely also in their very types of organization derived from their origin and in their very diverse inherited methods of administration. Therefore it has been impossible to standardize their form and management.

Legislation has either ignored the county and left its primitive forms and methods to be outgrown and restrictive of growth, or it has still further embarrassed county administration by a patch-work of confused and often conflicting laws, which have made good government impossible and left officials uncertain of their obligations and without supervision. Local governments of the town, municipality and the county have thus been left, each to go its own way, without correlation or co-operation either with each other or with the state.

The resulting confusion and conflict, duplication and waste widely prevalent have never been more effectively exposed than by the Chicago Bureau of Public Efficiency in its report on the nineteen local governments in Chicago. There are actually twenty-six within the territory in which citizens of Chicago live, and within the county of Cook there are no less than 300 taxing bodies, the county clerk spreading 366 separate taxes.

Every elector of the county living in Chicago is expected to vote for 69 county officials, of whom the report declares "each one is practically independent of

all the others and is responsible for his conduct in office only to himself and to the people who elect him. There is nowhere in the county government any central, co-ordinating official or body." During a period of nine years this same elector is summoned by national, state and local elections to choose officials for 144 different elective positions. On the combined national, state, county and judicial ballot voted at Chicago at the November election in 1912, there were 440 names of candidates.

Politics

The advantage in this situation given to and taken by partisan politics rounds fully out the overwhelming odds against intelligent and patriotic voting.

As we have seen, the county is the most permanent and effective seat of partisan politics in America. The county seat is actually the seat of the county central committee. It, or the county boss, actually selects the county commissioners and other officials whom the bewildered voters are supposed freely to elect. When their selection is made formal at the polls, it has been truly said that "the only man competent to issue orders to county officers that they shall do thus and so, or, failing to obey, shall be disciplined; the only man competent to enforce those orders is that unofficial but most powerful being, the county boss." The contracts let by county officials and far more the fees and salaries of some of them, which in some city counties far exceed the salary of the President of the United States, are tributary to the treasury of the dominant party's county organization.

Thus the vicious circle goes on its endless round. Thus despite, and even because of, the increasing expenditure and human importance of county administration, inefficiency and neglect have increasingly characterized and scandalized it the country over, with comparatively few conspicuous exceptions.

At last this gauntlet, which has so long been flung at the feet of local patriotism and which has been left to lie there so shamelessly long, is being picked up here and there by those who can no longer tolerate politics which have no connection with what is human, or religion which is separated from such human interests as are at stake in local politics. Household ties and affection are beginning to intertwine themselves in the affairs of households of civic as well as of religious fellowship. The people's politics is asserting itself in determined efforts to understand, simplify, unify and humanize local governments.

This movement has at present two tendencies in dealing with the difficulties of county administration. One is virtually to abolish the county by transferring its functions to the state.

This suggestion comes chiefly from city dwellers who are so overwhelmed by the complexity of their multiple local governments, and the inefficiency and corruption involved thereby, as to despair of any simplification or solution of their problem, except by the elimination of this one of its main factors. They argue, and with much force, that the

state whose legislature makes the laws should control the states attorney who can either execute or nullify them, as his county constituents may direct. They plead that the coroner's office can be effectively filled only by the appointment of an official who can meet both the medical and judicial exactions of a function that belongs to the state and not to the county, where "great power and great obscurity" are entrusted almost inevitably to "a person of no special ability or character." They cite the necessity and advantage which have led to the transference of the care of the insane, the epileptic, the feeble-minded, the delinquent, from the county to the state. Thus, one after another, they propose to eliminate the functions of the county by merging them either with those of the state or the municipality.

The other tendency in dealing with the difficulties of county organization is toward reconstituting county governments by home-rule charters. Recognizing on the one hand that the county is too deeply rooted in the ground plan of our entire system of government, of the judiciary and of party organization, to be eliminated; and on the other hand, that the county is the principal, if not the only, governmental agency through which our rural people, who constitute 42 per cent of our entire population, do the things that each man, woman and child of them must have done, these promoters of the county as a democratic unit propose to adapt it to each of three differing conditions.

Counties including agricultural areas and rural towns may be adapted to the commission form of government with a county manager. The bill providing for this change which is urged by the New York Short Ballot Association, has in part at least been anticipated in Shelby County, Tennessee, of which Memphis is the county seat. The act, as affirmed by the chancery court, while leaving the justices of the peace their constitutional prerogative of constituting the legal county government, transferred the actual management of the county affairs to three commissioners by authorizing them to conduct the department of workhouse and turnpike roads, the department of county health, and the department of purchasing and finance. The bill proposed for New York state provides for three county supervisors at large, one to be elected each year, who shall appoint a county manager to be their executive officer, purchasing agent and general overseer of all county work and institutions, with power to appoint their superintendents, together with the county treasurer and attorney.

County Federation

For the second class of counties, which include both rural and city communities, a federation is proposed which, while leaving each local community intact and free to develop its own interests, invests the delegated county board with the powers of a central governing body over the police, the civil service and the election of superior judges, the appointment of the sheriff, the court clerks and public administrator being left with these

judges. This plan, which also provides for the short ballot and the county manager, was elicited by Alameda county, Cal., in its quest for a better adjustment of taxes for its city and country communities. Much is hoped from the fellowship of such a county federation in promoting a community of interests between the city and country people, and in interesting private citizens in their public county affairs. In counties including cities of the first class, it is proposed to make their areas practically co-terminous, so that the functions of both may be combined, as they are in New York, San Francisco, St. Louis, and will be in every great city.

It has been well said that in spite of the county's "monotonous tone, its semi-legal atmosphere, its lack of popular appeal to the imagination, our national reconstructive genius has at last fastened upon the county as a fallow field for its operations." It is evidenced by the rise of such investigating bodies as the Westchester County Research Bureau, such propagandism as that of the New York Short Ballot Association, such expert agencies as the Bureau of Municipal Research in New York city and the Bureau of Public Efficiency in Chicago, and such groups as are undertaking local surveys of rural and municipal communities.

Rural Voters

In one such rural township of Minnesota the investigators were met with such expressions of indifference to citizenship and contempt for politics as these: "The more Americanized we are getting to be, the poorer citizens we become," "a farmer of today won't even read or talk about politics, to say nothing of going to political meetings," "what's the use of farmers taking off time for politics when the whole thing is run by political bosses anyway."

But the more public-spirited farmers of this community thought that "schools run by the government certainly should do more to acquaint the growing generation with practical knowledge about government." "We need young men," they said, "who will understand the organization of society in government, and who clearly see the relation between the local township and the county organization, and the connections between the county, state and federal governments. Then farmers will get to see how vitally their own welfare connects up with governmental activities."

Thus not any too soon, but all too late, politics is being disconnected from mere partisanship and identified with what is human and universal, with what concerns man as an individual and as a social being. In so doing, the county may well be made the local base for democratic participation in government. Its care for roads and water, for health and sanitation, for the poor and the afflicted, for the courts and their administration of justice, certainly makes its service very human and of interest to every individual. The county lies all around and very close to every home and neighborhood, every one's home town and city, and therefore ought to

be, and can become, the framework for the fellowships formed about those most primitive and personal possessions.

All this humanizing of politics and extension of local and state governments seem to be superseding those very voluntary agencies which have given birth to the humanitarian spirit and have borne the burden and the brunt of giving to it all its varied and costly expression. But never will history let us forget that from the beginning until now it has been the function of these volunteer agencies to initiate, to experiment, to demonstrate. They still will be called upon to exercise these functions before any branch of government will feel authorized to take over and carry on what is thus attested.

Co-operation

Never in all the history of their long relationship to public agencies have the volunteer agencies, including the churches, been more absolutely indispensable than now. For, with the progress of the democratic state, with the extension of the franchise to women and the foreign-born on the largest scale ever attempted, with the placing of more and more responsibility upon the individual citizen, with the ever increasing exactions upon officials, the public agencies were never more dependent upon the active, intelligent, constant co-operation of volunteer agencies and private citizens than now.

We who constitute the membership and administrative forces of these private agencies should look upon their overflow into public policy and administration with gratitude untouched by jealousy. No greater attestation could be given our motives and our methods than to have them built into the ideals and structure and standards of the community. Nothing could have been better for the progress of legislation and official administration than to have had these new responsibilities and functions entrusted to the public agencies and built into the very framework of the state. Thus we have been humanizing government. We have been idealizing politics. We have been more or less fraternizing the business of public affairs. We have added professional status to competent public officials by sharing with them these great humanitarian functions now belonging to the town, the county, the municipality and the state.

Instances multiply which demonstrate not only the practicability and efficiency of co-operation, but also clearly show that so great has become the interdependence of the public and volunteer agencies, officials and private citizens, that one cannot succeed if the other fails. These instances are conspicuous in the four fields of administration, legislation, civic training and the social application of religion.

First and most fundamental in the field of administration is the co-operation between such volunteer, expert agencies as the New York Bureau of Municipal Research and the Chicago Bureau of Public Efficiency with the official agencies charged with making and standardizing budgets and public accounts. Resentful suspicions and self-

defensive antagonisms are at this crucial point giving way to sympathetic and constructive co-operation, greatly to the public welfare. City clubs, both of men and of women, are setting the type and the method of intelligent participation in public affairs which can be carried on and out into the administration of town and village, county and state.

Publicity is not only thus best given to the conduct of public affairs, but public opinion thus brings to bear its promptings and deterrents upon such critical issues as the granting of public utility franchises and the issuance of bonds.

The coroner of Cook county, startled by the increasing inquests involving preventable deaths—nearly 5,000 a year in Cook county, and 123,000 last year in all counties, while in four years of the Civil War not more than 90,000 on both sides were killed in battle—appealed for a commission of public safety to help prevent the needless slaughter. In response the great railways, trolley lines, transfer companies, automobile manufacturers, machine shop managers and trade unionists lined up with public officials of the health, police and other departments to examine the causes, and united to prevent, so-called accidental deaths.

The effectiveness of such co-operation strikingly appears in the humanizing of the administration of justice. Juvenile court committees and the Juvenile Protective Association support and aid judges and probation officers in their difficult and delicate task of supplementing family discipline. At Chicago the County Court is assisted by four social investigators to report antecedents and surroundings in cases of insanity. The Juvenile Court has thus secured a woman assistant to the judge who hears the cases of delinquent girls in the privacy of the court chambers. The Court of Domestic Relations has a trained social worker to advise the distraught women. Both courts have a rest room for the women and a nursery for the children. The Boys' Court, for those over the juvenile court age, has trained investigators and advisers at work with the judge. The Morals Court, dealing with victimized girls and wayward women, has also women assistants who work in co-operation with women police officers.

Constructive Work

In preventive and constructive effort commercial bodies and women's clubs are working with school boards and park commissions to develop the neighborhood use of school buildings and the establishment of playgrounds and recreation centers.

Out of such co-operation such social work has been added to municipal and county service as that so successfully administered by the Kansas City Board of Public Welfare and that which has recently been undertaken jointly by city and county at St. Joseph, Missouri, under the Board of Public Welfare, and at Chicago by the county Bureau of Public Welfare, which assumes investigation and after-care of the families of inmates in the county infirmary for the

poor, the tuberculosis hospital, the county jail, and other public institutions.

In the field of national, state and local legislation, volunteer and expert organizations are more and more effectively supplanting the secret lobby of special interests. Such co-operative bodies are recognized by our legislatures and courts as valuably co-operating in the delicate and difficult adjustment of law to the needs of life, of judicial justice to the ever advancing demands of social justice.

To awaken and guide this new interest in public affairs among both private citizens and public officials, far more efficient training for volunteer and official service must be more widely furnished by public and professional schools, and by such a specialized journal as *THE SURVEY*.

It may be said that the most hopeful sign of the times is that so many of the regular occupations in life are felt to have a social bearing upon community welfare. In rural communities, bankers, lumber dealers and other tradesmen are being urged at their conventions and by their trades' journals to become "community builders" in their small towns and agricultural counties and are taking a new interest in village improvement, town planning and county administration.

Public Loyalty

To bear home to the hearts and consciences of those in training for all occupations, this loyalty to public welfare in their private pursuits is the highest service which teachers and trainers can render the commonwealth. Manufacturing and commercial men need to be taught and inspired to regard the safety and welfare of the human elements of their plants as not only promotive of business efficiency, but as their responsibility in promoting public welfare. Doctors need to be imbued with the prior claim upon them to co-operate with health departments and commissions in assuring public health by the improvement of sanitary and hygienic conditions, at whatever cost to their curative work and its rewards. Lawyers' patriotic, expert service is desperately needed in the framing of laws and ordinances, for the prevention of unnecessary and wasteful litigation, for the simplification of legal procedure, as well as in the manifold administration of law.

A new professional ethic must be taught in medical and law schools if the claims of humanity and the state are to be considered paramount to the opportunities for personal gain at public expense. So, too, teachers and ministers have not all yet heard the divine and human call to build the community up out of their schools and churches, and not church and school out of the community, nor have they learned how to do it.

To train the leaders of this volunteer rank and file in all the occupations of life, technical schools for civic and social training have arisen to meet the demand, either independently or in affiliation with university graduate

schools. They have amply demonstrated the need for this new specialized education, in that their offer to furnish trained workers has created a demand for them so great that the supply has never yet been sufficient to fill the old and new positions requiring special training. But these very leaders must depend for their rank and file, not only upon the academic discipline given the fewer in the higher educational institutions and the practical work for rural citizenship by agricultural colleges, but also upon the incentive to good citizenship prompted in the youth of the high schools, and in the boys and girls in all stages of progress in the grade schools.

Humanized politics and volunteer co-operation put up to the churches the most imperative claim for the greatest service which their respective communities and their common country have ever demanded of them. Never were their religious ideals of life, individual and collective, more essential; never was their inspiration to seek and realize these ideals more needed; never was the power for service which religion begets in the self-emptying, God-possessed personality, more absolutely essential than now not only to the progress but to the very self-preservation of the state. Slowly but surely the literature and life, the declarations of industrial and social principles, community surveys and activities, the Y. M. C. A. county work, and above all, the organized and federated co-operation of the churches, are pledging their obedience to this imperative mandate of God and man.

There is at last a growing conviction that even the church cannot succeed if the community fails, and that the community cannot succeed if the church fails. The citizen is feeling his need of religion in "facing all that is disagreeable and problematic in democracy, concealing nothing, blinking nothing away, and at the same time, keeping his will strong and temperate, so that its edge will never turn." For the citizen "to meet all his social obligations properly, to pay all his political debts joyously, never to throw a glance over his shoulder to the monastery—this is a mighty day's work."

One of the keenest satires on the failure and futility of much church work to meet the demands of the times, ends with this frankest confession of the need of it in a democracy, and this noble insistence upon the dependence of social justice upon religion:

"Nothing but a church will do. All the other schemes of democracy come to naught for want of that. The lecture platform is no substitute for Sinai. Democracy is a religion or nothing, with its doctrine, its forms, its ritual, its ceremonies, its government as a church—above all, its organized sacrifice of the altar, the sacrifice of self. Democracy must get rid of the natural man, of each for himself, and have a new birth into the spiritual man, the ideal self of each for all. Without religion, how is man, the essentially religious animal, to face the most tremendous of all problems—social justice?"

Other Conferences

Southern Sociological Congress

C. A. WATERFIELD

Paris, Tenn.

Organized three years ago, having the cordial endorsement of every southern governor save one, swinging in its annual orbit from Nashville around by Atlanta back to Memphis, and dated for Houston in the Far West next year, the rise of the Southern Sociological Congress augurs well for the whole country no less than for the South.

The Solid South for a Better Nation, that was the constructive statesmen-like pennant at full length across the big theatre platform. Not the old political solid South; but a new economic, industrial and social South, with its own life and problems.

A significant fact was the executive headship of J. E. McCulloch, a young man less than forty, who conceived and has practically conducted the congress through its first years; together with the active presidency of Gov. William H. Mann, now re-elected for a second term, little less than seventy, a ruddy, ripe altruist from the Old Dominion, who has served as legislator, prosecuting attorney, governor and Sunday school teacher there for a half century.

The congress contemplates ordinarily, a survey, discussion and report in the following departments: conservation and national efficiency, public health, courts and prisons, child welfare, organized charities, people in transit, race relations, the church and social service.

For the year and program just passed, however, an arrangement was made between this body and the National Conference of Charities and Correction for a division of subjects, in view of the fact that the national conference was meeting in the South and at Memphis. This in itself was a fine instance of co-operation and social mindedness, and under it the southern congress confined itself to two departments, race relations and church and social service.

It is easy to see how, to a few of those not informed on this mutual working agreement, this led to a feeling that the congress was, as the Athenians of old, in all things too religious; or, as one more modern opposer put it, too "damn pious"; whilst some others, from the same failure to take their bearings, held that the whole affair tended to run into a sort of Negro "big meeting."

All this, with other very natural causes, led to a spirited, though entirely unofficial and amicable discussion, concerning the coalescing of the southern congress with the national conference.

In theory there is an inevitable logic in behalf of such a blend. When the

question is considered with the practical problem of reaching the people and covering the field in mind, however, a gun-proof (God save the word!) reasoning appeared in favor of the southern brethren going on with their splendid work, in the face of the vast area and diversity of the service required.

The motive for the separate service, it was urged, was by no means a sectional one, but a purely physical one; the problem was a matter of dimensions and of accessibility.

Governor Mann, the president, in his message, adopted the inductive method of using as a basis his last message to the General Assembly of Virginia.

Bishop Theodore Bratton of Mississippi and Booker T. Washington opened the work for the department on race relations, the former in an address which, for nobility and elevation, for broad sympathy and sane caution against haste, was worthy of the profound and touching theme, and which swayed the deepest chords of human feeling in the great audience. Dr. Washington made one of those woods-shelling pleas of his for justice and good sense which blow like a fresh gale through head and heart of black and white.

Others who brought really notable papers under this department were Prof. A. M. Trawick and W. D. Weatherford of the International Committee of the Y. M. C. A.; Mrs. Florence Kelley of New York; Major R. R. Moton of Hampton Institute, and Dr. C. V. Roman of Nashville, Tenn., the last two being Negroes.

But the chief emphasis and the largest service of the congress was in the department of the church and social service. As in the other department the leaders in the South have and know that they have at once a unique opportunity and a big responsibility. If the race relations in the South are rarely comprehended by outsiders, hardly less so are the relations between the church and the outside social order. In the South the local church is yet the strongest educational agency and the most powerful factor in public life. If for no other reason than the first-hand and scientific treatment of these two questions, the southern Congress may be for a long time needed. The Rev. C. S. Gardner of the Louisville Baptist Theological Seminary declared to the writer privately that he regarded the religious crisis in the South as the greatest in the whole history of the church.

A score of speakers assembled an amount of information and registered a challenge which command confidence that the living church will awake and prove equal to the needs of the new age and that the social forces sweeping around us shall have shot through them the gulf stream of the ancient gospel.

National Jewish Charities

MRS. OSCAR LEONARD

The eighth biennial session of the National Conference of Jewish Charities, held in Memphis, May 6 to 8, with a good attendance, discussed chiefly the problems consequent upon recent Jewish immigration. As Cyrus L. Sulzberger of New York stated in his presidential address, the Jewish immigrant has not been understood, and many mistakes have been made in handling him. "We should adopt a fraternal instead of a paternal attitude toward our brethren" was one of his salient remarks.

The Industrial Removal Office in New York, of which David M. Bressler is chief, and the Galveston Bureau in charge of Maurice Epstein, are doing excellent work in distributing immigrants among communities affording a maximum of opportunity for self-development. But new problems are constantly arising in connection with Jewish immigration. The influx within the past few years of thousands of Jews from southeastern Europe has created an entirely new situation. A timely discussion of this problem was presented by David DeSola Pool of New York on Oriental Immigration, or, as he prefers to call it, Levantine immigration. The Levantine population, with language and customs distinctly foreign to those of the people from Russia, Roumania, Galicia, and Germany, presents a problem which has only recently begun to concern the conference. A survey of the oriental Jewish communities in this country was recommended by the committee on resolutions.

The possible effect on immigration of the opening of the Panama Canal was discussed by Lucius L. Solomons of San Francisco. He looks for a marked increase in immigration in consequence of the opening of the canal, but does not expect the extraordinary numbers predicted by some observers. Mr. Sulzberger and Mr. Epstein did not think that immigration to the Pacific Coast would be appreciably increased.

The report of the standing committee on Palestinian charities was read by Judge Julian W. Mack. The committee has made some progress in organizing the collection of funds for Palestine and it was authorized to continue its labors, as well as to attempt to secure the co-operation of the federated charities in the communities.

Another distinctly Jewish phase of philanthropic work was brought out by J. J. Dukas of New York. In accordance with ancient Jewish law, no man is permitted to charge interest to a member of his own race. The Free Loan Association makes loans without any charge for interest. Oscar Leonard of St. Louis contended that such free loans fail to inculcate a feeling of self-respect and independence on the part of the borrower.

Another solution was suggested in a paper on Self-Respect Funds by Lee K. Frankel of New York. He reported in detail on the use of such funds by the United Hebrew Charities of New York, which are thereby enabled to re-establish

on a basis of complete self-support certain of their more hopeful applicants.

The transportation rules adopted by the conference fourteen years ago have succeeded to a marked degree in breaking up the unfortunate practice of furnishing railroad and steamship tickets to dependent individuals and families without a knowledge that their condition will be improved thereby.

Boris D. Bogen of Cincinnati, speaking on Standards of Relief, demonstrated that the individual per capita cost of supporting a family decreases as the size of the family increases, and reaches its minimum when the family consists of parents and five children. A larger number of children does not affect the per capita cost.

A short space was given to the discussion of Advance in Settlement Work by Jacob Billikopf of Kansas City. The establishment of a modern Hebrew school, conducted according to the Benderly system, has proved to be an effective instrument in "Judaizing" the settlement. Although the Hebrew school, however modern, cannot take the place of the settlement, a combination of the two would seem to meet with approval. Charles S. Bernheimer of Brooklyn and Emanuel Sternheim of Greenville, Miss., led the discussion on this paper.

A paper on the After Care of Orphans by Alice L. Seligsberg of New York told of the splendid influence of Fellowship House, which keeps in personal touch with graduates of orphan homes. S. Wolfenstein, for many years the head of the Jewish Orphan Asylum of Cleveland, was in the audience, and was called upon to speak. Dr. Wolfenstein told of the methods used by his organization, which keeps in touch with every child who leaves the institution. An ovation was tendered this beloved veteran in humanitarian service.

The new officers are as follows: President, Minnie F. Low, Chicago; vice-presidents, Aaron Cohen, Pittsburgh; Fred N. Butzel, Detroit; David M. Bressler, New York; treasurer, Bernard Greensfelder, St. Louis; secretary, Louis H. Levin, Baltimore.

The Red Cross

Because of the great interest which flood prevention has for the people of the Mississippi Valley, chief emphasis in the Red Cross meeting held in Memphis on May 14, was laid upon a discussion of the project for the prevention of floods in China in the valley of the Hwai River. The history of 2,500 years of floods in that valley was briefly told in THE SURVEY for May 2. Its analogy to the scattered efforts at river protection along the lower Mississippi was pointed out.

That fevers and other diseases directly following overflows have a tendency to weaken the population at the very moment in which its greatest energies are necessary for prompt recovery from flood effects, and form a serious feature of such disasters, was indicated in an address by W. M. McGrath of Birmingham.

Eugene T. Lies of Chicago briefly de-

scribed the effects of the tornado which occurred in Omaha on April 23, 1913. Conditions following the floods of 1913 in the Ohio Valley were described by Sherman C. Kingsley of Chicago. The nursing service of the American Red Cross was described by Fannie F. Clement and a brief statement was also given of the preparation which the Red Cross has made for meeting any conditions which may arise out of the Mexican situation.

The Children's Conference

PAULA LADDEY

The eleventh Conference on the Education of Backward, Truant, Delinquent and Dependent Children held at Memphis May 6-8 might justly add to its already lengthy title, Defective, for there were few speakers who did not in one way or another touch upon the overwhelming problem of the defective child. It seems to have been the consensus of opinion that the defectives must be separated from the delinquents and dependents and be given permanent custodial care. The mentally normal dependent and delinquent child, however, should be placed out in private families as quickly as possible. Although it was brought to the conference's attention that children frequently receive better physical care in an institution, it did not change the general opinion in favor of placing them out. It only accentuated the idea of putting forth the very best effort in carefully selecting homes.

The joint session with the National Probation Association was most interesting. Case study of the child before the court and the method of dealing with him on probation was admirably discussed by Edwin Mulready of Boston who pointed out the great value of personal work with the individual. A sharp line was drawn by E. E. Gardner, Howard, R. I., between the normal and defective child when he discussed case study in the institution. The probation officer cannot cope with the defective child nor can the institution which is not especially equipped therefor.

Judge George S. Addams of the Cleveland Juvenile Court gave a lucid explanation of the Ohio children's code, drawn to meet any situation that may arise in the case of children. The code has helped Judge Addams considerably in his court and he advocated similar codes for other states.

Calvin Derrich, superintendent Preston State School of Industry, California, divided the boys for which society has to care into five groups. The first two were the mentally and morally incompetent; third, physically diseased; fourth and fifth, incorrigible and backward.

The first three classes he refused to discuss, as they should never be put in the same institution with the fourth and fifth class.

For every well regulated school he advocates three principles—absolute discipline, absolute freedom and vocational training. The first two might seem paradoxical, but they were far from it.

Absolute discipline is necessary in order to teach self-control and absolute freedom in order to give expression to the acquired self-control. In relation to vocational training, Mr. Derrick urges that the children be taught something which they can do well and by which they can earn a living no matter how menial.

Charles H. Johnson, superintendent Leake and Watts Orphan House, Yonkers, N. Y., showed that many so-called dependent children are needlessly placed in institutions. He urged that thorough investigations be made before shutting children in institutions. His experience has revealed great carelessness in dealing with dependent children. He spoke of an orphan asylum where the number of inmates was reduced from 400 to 100 children after careful investigation.

National Probation Association

The spirit of co-operation controlling the sixth annual Conference of the National Probation Association, held in Memphis, found a free rein in the interchange of ideas at the round table discussions by the eighty-one delegates present.

The meeting on the defective delinquent was conducted by Alexander Johnson of Vineland, N. J. It was evident from the discussion that the mental status of both juvenile and adult offenders is becoming more and more a problem for courts to consider.

L. A. Halbert, general superintendent of the Board of Public Welfare, Kansas City, conducted the discussion on the Probation Treatment of Adult Offenders. Emphasis was placed on firmness of discipline and reality of punishment and on methods of checking up the conduct of probationers.

Bernard Flexner of Louisville declared that although juvenile court laws are state-wide in their application there is great inequality in their actual operation; that, whereas, we had specific instances of the successful operation of courts in large cities, practically nothing had been done to develop the court in rural communities; and that in any appraisal which we made of the work of the court we certainly would have to consider this part of it as on the debit side; that it was up to the judges, as well as the lay workers, to attack this question seriously.

Judge Baker of Boston spoke on the separation between the social and judicial functions of the court. Summing up, he said that the tendency today was to divorce the control of probation officers in their case supervision from the court, leaving the judges to pass solely on jurisdiction facts. The discussion brought to light two methods of solving the problem of the rural community: first, the county system, in which the judges appoint probation officers in their districts, and second the State Board of Control, which appoints all rural probation officers and supervises their work.

The consideration of Social Legislation as Suggested by Probation Work led by Mr. Fullerton of St. Louis, brought out the fact that the courts are

really only makeshifts and the result of a bad social system; that we ought to look forward to a decreasing amount of delinquency as the result of better economic, recreational and institutional facilities. One method of securing this utopia will be through social legislation along these lines.

At the luncheon for women probation officers Mrs. Falconer presided. Maude E. Miner of New York and Julia C. Lathrop of Washington both sounded a new note in criminal procedure—that today we are not leaving our criminal courts entirely in the hands of police and prosecuting officials but are beginning to study the social surroundings of all offenders, and that for women offenders women officials are needed.

Hastings H. Hart made so interesting a usually dry subject, the Record and Report Standard, that more attended this meeting than any meeting of the conference.

The conference appointed a special committee to study the condition of the rural community and to report at the next meeting on the advisability of paying a field man who could intelligently direct the work of both research and education on the need of the courts for such communities.

Charity Officials

The American Association of Officials of Charity and Correction held a two days session in Memphis, preceding the National Conference of Charities and Correction.

This association appeals to members and officers of state boards of control, state boards of charity and superintendents of institutions under their administration and supervision; also to the officers, superintendents and boards of all private institutions which receive public aid or are under the supervision of state authority. Its policy of confining itself to practical, everyday problems of administration and supervision, is proving popular, and for next year it has been decided to amplify this policy, so that all formality of program will be dispensed with and the sessions left entirely in the hands of the members present.

Accordingly, for each session, there will be submitted one question with informal introduction by two leaders, after which all the time will be devoted to interchange of ideas. The subjects, it has been stipulated, must strictly concern administration and supervision.

The next meeting will be held in Baltimore, Md., on the two days preceding the opening of the National Conference.

Joseph P. Byers of New Jersey and Robert W. Kelso of Massachusetts are the new president and secretary.

The meeting in Memphis was characterized by several subjects which in late years have been little considered in national gatherings. One was Kitchen Organization and Economy, by Charles S. Pitcher, steward of the Kings Park, N. Y., State Hospital, whose paper is of such practical importance and value that it is already in general demand throughout the United States. Helen Sinclair contributed a distinctive paper

in her discussion of the organization of a nursing service in a state hospital. An afternoon spent on poor relief and its allied phases, under the leadership of Amos W. Butler, was remarkably out of the beaten path. A standard system of accounting and a support or pay-patient department in state institutions, the first by Richard W. Wallace of New York, and the second by H. H. Shirer of Ohio, attracted attention because they are live subjects in every state organization.

Under correction, a State Penal System and a Wage System for Prisoners, particularly the technique of administration and supervision, afforded new opportunities for those present to learn and exchange ideas.

The president's annual address, by A. L. Bowen of Illinois, was a plea for the professionalization of the administration and supervision of state and private charities, and a continuity in service of members of boards and superintendents of institutions. He presented figures, showing that the national charitable, correctional and penal service has property worth a billion and a half dollars, expends at least \$300,000,000 a year and is caring for nearly half a million inmates, while the appropriations of taxpayers' money for strictly state charitable and correctional purposes amount to \$100,000,000 annually.

Settlements

To provide a common ground on which different classes in the community may look at things from each other's points of view—such has been from the beginning a fundamental aim of the social settlement. At the Memphis meeting of the National Federation of Settlements this spirit was applied to elements within the settlements' own circle. For the gathering drew together, in frank and fair discussion, settlement residents and members of settlement boards of trustees to consider their relations to each other.

Although the discussion was occasioned by an acute situation in the University Settlement in New York—in which the body of residents, going over the head resident, contended that they should have representation on the council, joined the association, elected one of their number to the council, were then told that they were "insubordinate," and went on what amounts to a strike—there was no display of bitterness or intolerance on the part of the member of the council and the resident who were present from this settlement. The generous effort to find the right basis of relationship and the good fellowship which prevailed showed finely the real settlement spirit.

It was clear that in such settlements as have grown up around a big personality looked up to by both board and residential group, the problem of control and administration is simple, while difficulties tend to arise when such a personality is not a factor. All agreed that when "absentee trustees" undertake too detailed control of the activities of the settlement and its residents the result is most unfortunate.

The danger of making a settlement too institutional, stifling individual initiative and the spirit of personal relationship with the neighborhood, was squarely faced. The growth of a "plant" and the consequent "property care" by trustees to see that the plant is used as the donors wish, was frankly regarded as often inimical to the development of the settlement ideal. "A settlement can be organized to death," said one head resident.

The feeling was expressed by an unexpectedly large proportion of those who took part in the conference that the settlement of the near future would have no plant at all but would consist of a group of people living in a home-like way near some school social center or similar public institution, devoting themselves to neighborhood leadership and helping to put the social facilities of the community to the widest and wisest use. The executive committee of the federation was instructed by a resolution to embody in the program for next year topics concerning the administration of settlements and the community function which they should have in view of the increasing public provision of facilities for social welfare.

The fundamental non-sectarian basis of a settlement was strongly reasserted and many insisted that so-called settlements which exist for a proselyting or propaganda purpose should take a different name.

Methods of money raising and also training of residents by the head resident were also considered.

Charity Organization Societies

The meetings of the American Association of Societies for Organizing Charity at Memphis were unusually interesting in that a larger number of secretaries and workers from the advance lines in the South and Southwest were present than ever before.

James P. Kranz, general secretary of the Memphis Associated Charities, discussed the question of the southern society and the Negro. In every southern city the Negro population is proportionately large, ranging from 20 per cent to 50 per cent. No southern society can afford to ignore so large a bulk of its population.

For two years Memphis has operated a Negro auxiliary known as the Colored Federated Charities. This has a board of Negro directors, which is practically a committee of the Associated Charities, and its own committees and workers.

The independent Negro organization has inherent weaknesses in that most Negro organizations split along the lines of finances, church ambitions, or lack of confidence in one another. All of these are eliminated in the Memphis plan in that the Associated Charities controls all of these three points of possible disagreement.

The other plans of using white workers or Negro workers with no colored board are weak in that the Negro citizens as a people take no interest in the work. In every city in the South where

there is no Negro board, no money is raised by the Negroes for general support, but in Memphis the Negroes in the past two years have raised \$2,500 and have 116 different subscribers. The Negroes meet one-fourth of the cost of operating the Negro department.

Fred S. Hall, associate director of the Charity Organization Department of the Russell Sage Foundation, presented a much discussed paper on The Financing of Our Societies from the Point of View of Salesmanship.

The annual report of the general secretary took the form of presenting some of the unusual family problems which had been presented in unorganized communities, problems which no amount of social change could possibly affect, which required organization and steady intelligent heart-given work over a number of years, on the part of the paid and volunteer workers. He indicated in his report that there could not be too highly trained service in the smallest cities, which demanded the best.

Some State Meetings

The second annual session of the Alabama Sociological Congress, held in Birmingham, May 3-5, resulted in four distinct social movements: a state Social Service Committee with ten locals, a state anti-tuberculosis campaign, a state child welfare movement, the establishment of a Negro section of the congress presided over by the Negroes themselves.

In addition to these results a social program for Alabama was prepared, including the following measures for proposed remedial legislation: a workman's compensation act compulsory education, new child labor laws, a law raising the age of consent to 21 years, a state health code, anti-tuberculosis legislation, equal suffrage, equitable distribution of school revenues, prison and convict probation system, remedial loan legislation, state housing code.

Two things were brought out clearly at the meeting of the third Arkansas State Conference of Charities and Corrections held at Fort Smith, May 5-6. One was the need for an institution for the feeble-minded, the other was for the better care of juvenile delinquents.

Durand Whipple of Little Rock stirred the conference to the need of immediate action by the state to provide custodial care for the feeble-minded. The hospital for the insane—known as the Hospital for Nervous Diseases—under the leadership of Dr. J. L. Greene, has taken front rank in the United States and the schools for the deaf and blind are among the best in this country, yet the feeble-minded have been so long neglected that Arkansas has now a stupendous problem.

The next meeting will be held in Pine Bluff in May, 1915. The Rev. Paul Preston, Fort Smith, was elected president and M. A. Auerbach, Little Rock, secretary.

Two matters were reported upon at the recent Delaware Social Welfare Conference which gave great satisfaction to all who were present. It may

be remembered that only a year ago Delaware passed a ten-hour law for women wage-earners. The inspector under that new law, Miss Malone, reported on its operations for the past ten months as most gratifying.

The other report referred to was on the non-support law. Many did not even know of its passage. Under it the probation officer appointed by the court has the power to commit to the county prison any man who fails to contribute to the support of his wife or children. The prison pays to the probation officer the sum of fifty cents a day for the period of his term.

Perhaps the climax of the successful conference was reached when there was advocated and actually started an organization known as a Central Bureau for Social Welfare Legislation.

SITUATIONS WANTED

CAPABLE, conscientious woman. Head of Settlement. Twelve years in social work. Seeks connection—willing to leave New York. Address 1250, SURVEY.

SECRETARIAL STENOGRAPHER, experienced investigator, desires all-round work, preferably out of city. Nominal salary. Address 1269, SURVEY.

FARM INSTRUCTOR

Cornell agricultural man to instruct in farming and gardening. Practical and experienced in all phases, can take full charge of school farm and produce the best results.

Address 1268, Survey.

HELP WANTED

EXAMINER

Charitable Institutions

(Male and Female)

Applications for examination for this position will be received by the

MUNICIPAL CIVIL SERVICE COMMISSION

Until 4 p. m., Thursday, June 4

Candidates should be familiar with the laws affecting the care and relief of indigent persons and needy children in New York City, with the methods and agencies for the care and assistance of needy children, the sick and the poor, and with the present work and historical growth of both public and private agencies and institutions for the care and relief of such persons. Experience or special training in connection with charitable institutions, hospital social service, societies for the relief of the poor in their homes, or for aiding or protecting children, or training along similar lines, is desirable and will be given weight. Acquaintance with some standard writings on some of these subjects is expected.

Age limits, 21 to 50 years. Salary, \$1200 a year.

Application Blanks may be had at the Application Bureau, Municipal Building, Room 1400, or sent by mail on receipt of stamps.

(continued from page 239.)

months to put nurses in the field.

Dr. L. R. Williams, deputy-commissioner of health of New York state, gave an interesting statistical study of the rural and urban death rate of New York which apparently showed that while the city rate is declining, the rural death rate is increasing. The recent New York Legislature, at the instance of the State Grange, passed a law providing for special rural sanitation in which the rural nurse was to be a factor, but the appropriation to put this law into effect has been held up by the governor. In the discussion, Prof. W. K. Tate of Peabody College suggested that the higher death rate in the country might result in some degree from the exodus of young people to the city, leaving at home the old folks and babies, with their higher mortality.

Dr. Carrie Weaver Smith, of Dallas, thought that quite likely the large number of doctors from poorly equipped colleges is responsible for the undue death rate, particularly among young children. The country districts, she said, had more than a fair share of graduates of the B and C classes of medical colleges.

The public health discussion was continued in a paper on what the chairman called the Bookkeeping of Humanity, that is, The Needs and Present Status of Birth Registration, by Dr. Cressy L. Wilbur, formerly chief of the Bureau of Vital Statistics of the United States Census, now the chief statistician of the New York Board of Health. He stated that the recording of the birth of the child is the first point of attack in the prevention of disease, for unless the health authorities know of the existence of the infant, no specific steps may be taken to guard it against the numberless dangers which threaten its feeble hold on life. For it is more dangerous just to be an infant than it is to be afflicted with smallpox or typhoid fever.

Curtis E. Lakeman, executive secretary of the American Society for Control of Cancer, discussed Cancer as a Social Problem. He said in view of the fact that recent statistics show that there is a serious growth and spread of cancer, such an organization as he represented, for a study of its causes and best methods of control and cure, was distinctly worth while. Cancer is without parallel among human ailments. It is the most ancient recorded disease, and the most universally fatal to mankind. There is no certain cure except in its earliest beginnings. The cause of cancer is still in the dark, but many significant facts are available. Continued irritation has a marked causative influence, as is shown by the groin cancer of sailors and chimney sweeps, and cases among the operatives of sulphuric acid and ammonia plants. Environment also seems to have a marked influence.

The statistics for 1913 show the highest cancer rate on record. It is therefore a public health problem of the first magnitude, especially since a large proportion of cases are attacked in the most useful period of life.

INFORMATION DESK

The following national bodies will gladly and freely supply information and advise reading on the subjects named by each and on related subjects. Members are kept closely in touch with the work which each organization is doing, but membership is not required of those seeking information. Correspondence is invited. *Always enclose postage for reply.*

Children

CHILD LABOR—National Child Labor Committee, 105 East 22d St., New York. Owen R. Lovejoy, Sec'y. 25 State Branches. Where does your state stand? How can you help? List of pamphlets and reports free. Membership fee nominal.

CHILD HELPING—Department of Child-Helping, Russell Sage Foundation, 130 East 22d St., New York. Correspondence, printed matter and counsel relative to institutions for children, child placing, infant mortality care of crippled children, Juvenile Courts, etc.

CHILD WELFARE EXHIBITS—National Child Welfare Exhibition Committee, 200 Fifth ave., New York. Charles F. Powlison, Gen. Sec'y, Anna Louise Strong, Director of Exhibits. Bulletins covering Results, Organization, Cost, Construction, etc., of Child Welfare Exhibits. Will assist cities in organization and direction. Exhibit material to loan.

CONSERVATION OF INFANT LIFE—American Assoc. for Study and Prevention of Infant Mortality, 1211 Cathedral St., Baltimore. Gertrude B. Knapp, Exec. Sec'y. Literature on request. Traveling Exhibit. Urges prenatal instruction; adequate obstetrical care; birth registration; maternal nursing; infant welfare consultations.

Health

SCHOOL HYGIENE—American School Hygiene Association. Pres., Dr. Henry M. Bracken, Chairman State Board of Health, St. Paul, Minn. Sec'y., Thomas A. Storey, M.D., College of the City of New York, New York. Yearly congresses and proceedings.

MENTAL HYGIENE—National Committee for Mental Hygiene, 50 Union Square, New York City. Clifford W. Beers, Sec'y. Write for pamphlets on mental hygiene, prevention of insanity, care of insane, social service in mental hygiene, State Societies for Mental Hygiene.

PUBLIC HEALTH—American Public Health Association, Pres., Wm. C. Woodward, Washington; Sec'y., S. M. Gunn, Boston. Founded for the purpose of advancing the cause of public health and prevention of disease. Five sections: Laboratory, Vital Statistics, Municipal Health Officers, Sanitary Engineering and Sociological. Official organ American Journal of Public Health, \$3.00 a year, published monthly. 3 months' subscription, 50 cents. Address 755 Boylston St., Boston, Mass.

SEX HYGIENE—Society of Sanitary and Moral Prophylaxis, Tilden Bldg., 105 W. 40th St., New York. H. P. DeForest, Sec'y. 22 affiliated societies. Report and leaflets free. Educational pamphlets, 10c each. *Journal of Social Diseases*, \$1 per year. Membership, annual dues \$2, includes all literature.

NATIONAL ORGANIZATION FOR PUBLIC HEALTH NURSING—Object: to stimulate the extension of public health nursing; to develop standards of technique; to maintain a central bureau of information. Publications: Pub. Health Nursing Quarterly, \$1.00 per year, and bulletins. Address Ella Phillips Crandall, R. N. Exec. Sec., 54 East 34th St., New York City.

LIFE EXTENSION INSTITUTE, Inc., E. E. Rittenhouse, Pres. Gives life extension service to subscribers. Service No. 1 \$3.00 a year; Service No. 2 \$5.00 a year. Consists of periodic health examinations, inspection service, and health bulletins on disease prevention. Head office 25 West 45th St., New York City. Phone—Bryant 1997—1998.

NATIONAL HEALTH—Committee of One Hundred on National Health. E. F. Robbins, Exec. Sec., Room 51, 105 East 22d St., New York. To unite all government health agencies into a National Department of Health to inform the people how to prevent disease.

TUBERCULOSIS—National Association for the Study and Prevention of Tuberculosis, 105 East 22d St., New York. Livingston Farrand, M.D., Exec. Sec'y. Reports, pamphlets, etc., sent upon request. Annual transactions and other publications free to members.

SOCIAL HYGIENE—The American Social Hygiene Association (Inc.), 105 W. 40th St., New York. Division Offices: Chicago, 1632 McCormick Building; San Francisco, Examiner Building. Full information on request. Individual and society membership. The Association is organized to promote sound sex education, the reduction of venereal diseases and the suppression of commercialized vice. Executives, James B. Reynolds, Counsel; William F. Snow, M.D., General Secretary.

CANCER—American Society for the Control of Cancer, 289 Fourth Ave., New York City. Curtis E. Lakeman, Exec. Sec'y. To disseminate knowledge concerning symptoms, diagnosis, treatment and prevention. Publications free on request. Annual membership dues \$5.

Employment Exchange

SOCIAL WORKERS' EMPLOYMENT EXCHANGE—The Department for Social Workers of the Intercollegiate Bureau of Occupations registers properly qualified men and women for positions in social, religious and civic work. The needs of organizations seeking workers are given careful and prompt attention. Emma P. Hirth, Manager, 130 East 22d Street, New York City.

Libraries

AMERICAN LIBRARY ASSOCIATION—Furnishes information about organizing libraries, planning library buildings, training librarians, cataloging libraries, etc. *A. L. A. Booklist*, a monthly annotated magazine on book selection, is a valuable guide to the best new books. List of publications on request. George B. Utley, Executive Secretary, 78 E. Washington St., Chicago.

Aid for Travelers

AID FOR TRAVELERS—The Travelers' Aid Society provides advice, guidance and protection to travelers, especially women and girls, who need assistance. It is non-sectarian and its services are free irrespective of race, creed, class or sex. For literature address Orin C. Baker, Gen. Sec'y., 238 East 48th Street, New York City.

Remedial Loans

REMEDIAL LOANS—National Federation of Remedial Loan Associations, 130 E. 22nd St., N. Y. Arthur H. Ham. Reports, pamphlets, and forms for societies free. Information regarding organization of remedial loan societies gladly given.

Probation

PROBATION—National Probation Association, Municipal Courts Building, St. Louis, Mo. Hugh Fullerton, Sec'y. Advice and information; literature; directory of probation officers; annual conference. Membership, One Dollar a year.

Price 25 Cents

The New York School of Philanthropy

UNITED CHARITIES BUILDING, 105 EAST 22d STREET

EDWARD T. DEVINE, Director

SPECIAL TWO-YEAR COURSE IN PLAY AND RECREATION

Of the large number who undertake the direction of public recreation and amusement, more fail because they do not have a social point of view and an understanding of social needs than because of lack of familiarity with playground apparatus or other technical equipment. Accordingly in the School of Philanthropy, where the aim is to equip qualified leaders in the field of public recreation, rather than playground attendants, emphasis is placed on the social value of a rational use of leisure, on co-operation with public schools, parks, and other public agencies, and with voluntary agencies. Directors of playgrounds and recreation centers, secretaries of municipal commissions and of voluntary associations for propaganda and experiment must appreciate the value of play and recreation as antidotes to disease and crime, as well as their legitimate place in satisfying a normal healthy demand of children, adolescents, and adults.

Excellent opportunities are available for field work which will give both technical training and material for the discussion of these larger aspects of the playground movement.

The curriculum includes in the first year the following courses:

I.—Social Work. Edward T. Devine. Two hours per week throughout the year.

This course examines organized efforts to prevent poverty, disease and crime; efforts consciously made to affect entire neighborhoods or masses or groups of individuals: *e. g.*, housing reform, town planning, and play-ground movement.

II.—Individuals and Families. Porter R. Lee and Henry W. Thurston. One hour per week in the first semester.

A brief presentation of the principles which underlie social case work, a discussion of normal standards in the lives and activities of families, children and adult individuals.

III.—Statistics in Social Work. Kate Holladay Claghorn. One hour per week in the second semester.

An elementary study of the statistical material on which we have to depend for definite knowledge of social facts and social forces and in the presentation of facts in descriptive, tabular and graphic form.

IV.—Hygiene and Preventable Disease. Dr. James Alexander Miller. One hour per week throughout the year.

It is the aim of this course to present the important facts of disease and hygiene which playground workers cannot afford not to know.

V.—Play and Recreation. George Ellsworth Johnson. Three hours a week throughout the year.

This course deals comprehensively with the biological, physiological, psychological, sociological, pedagogical, moral, religious and economic significance of play; the origin and content of typical plays and games; the organization of play activities; the play movement; the administration of play and recreation systems; the plan and conduct of a recreation center; and the functions of the director.

This course with the related field work and excursions occupies about one-fourth of the student's time during the first year. Another fourth is occupied by courses given at Columbia University which bear directly upon the subject of play, recreation and physical education.

Candidates for the special two year course in Play and Recreation are required to pass the usual entrance examination. A college degree is not required but the examination covers many of the subjects ordinarily studied in college.

Full information in regard to special courses or in regard to the regular two-year professional training course in social work will be sent on application.

THE SURVEY ASSOCIATES, INC., is an adventure in co-operative journalism; incorporated under the laws of the state of New York, November, 1912, as a membership organization without shares or stockholders. Membership is open to readers who become contributors of \$40 or more a year. It is this widespread, convinced backing and personal interest which has made THE SURVEY a living thing.

THE SURVEY is a weekly journal of constructive philanthropy, founded in the 90's by the Society Organization Society of the City of New York. The first weekly issue of each month appears as an enlarged magazine number.

From the start, the magazine and its related activities have been broadly conceived as an educational enterprise, to be employed and developed beyond the limits of advertising and commercial receipts.

Price

Single copies of this issue twenty five cents. Co-operating subscriptions \$10 a year. Regular subscriptions \$2 a year. Foreign postage \$1 extra. Canadian 75 cents.

Table Linen

At McCutcheon's

Reg. Trade Mark

To make a summary here of our enormous stock of Table Linens would, of course, be quite impossible.

We merely wish to call attention to the fact that nowhere else can such a comprehensive assortment be found.

In addition to all the staple lines we carry the *unusual* in size, design and quality.

More than half a century of merchandising in Linens as a specialty has given us a clientele in every state and important town in this country.

We have studied closely and provided for the needs of this ever-growing number of customers, with the result that no such comprehensive stock of Table Linens can be found in any other house in the country.

Our customers have the added satisfaction of knowing that we stand behind every purchase made and guarantee its satisfaction.

This applies not only to our Table Linen Department, but to everything we sell.

Mail Orders Receive Our Prompt Attention.

James McCutcheon & Co., 5th Ave., 33d and 34th Sts., N. Y.

School for Social Workers

MAINTAINED BY SIMMONS COLLEGE AND
HARVARD UNIVERSITY

18 SOMERSET STREET, BOSTON, MASS.

ELEVENTH YEAR, 1914-15

One year and two year programmes for study and training in social service; for men and women; for paid or volunteer work.

FIRST YEAR PROGRAMME: September 23, 1914, to June 4, 1915—A desirable preparation for any form of social service, and an introduction to specialization in the second year or in work in the field.

SECOND YEAR PROGRAMME: September 9, 1914, to June 19, 1915—For further study and training, in a selected field. Open to those who have completed the first year satisfactorily and to others with acceptable preparation in social experience.

Practice work under careful oversight fills one-third of the first year and two-thirds of the second year. Boston offers exceptional opportunities for it.

For the first year programme, send for the 1914 Bulletin of the school.

For advanced work, send for the circulars describing the courses offered—Organizing Charity, Children's Work, Medical-Social Service, Neighborhood and Community Work.

JEFFREY R. BRACKETT, Director.
ZILPHA D. SMITH, Associate.

We Believe—

THAT home-making should be regarded as a profession.

THAT right living should be the fourth "R" in education.

THAT health is the duty and business of the individual, illness of the physician.

THAT the spending of money is as important as the earning of the money.

THAT the upbringing of the children demands more study than the raising of chickens

THAT the home-maker should be as alert to make progress in her life work as the business or professional man.

—American School of Home Economics

NOTE—Send for 100-page handbook, "The Profession of Home-making, which gives details of home-study, domestic science courses, etc., It's FREE." Bulletins: "Freehand Cooking," 10cts.; "Food Values," 10cts.; "The Up-to-Date Home," 15 cts.

Address—A. S. H. E., 519 W. 69th St., Chicago, Ill.

THE SURVEY

COMMON WELFARE

FULL SATURDAY HOLIDAY FOR RETAIL CLERKS

TUCKED IN among the advertisements of white goods, parasols and summer silks, in the New York newspapers, there has been an important notice the past week affecting thousands of department store clerks.

This notice announces that seven of the largest mercantile establishments in the city—Altman's, Lord and Taylor's, McCreery's, Vantine's, Bonwit-Teller's, Franklin Simon's and Wanamaker's—will for the first time give their employes an entire holiday with pay on Saturdays during July and August. Oppenheim, Collins & Company will close on Saturdays during August. In addition, each of these stores gives vacation with pay to employes who have been with them a certain length of time, usually one year or over. Another department store, James A. Hearn & Son, has closed its doors on Saturday for fourteen years, but in this case the custom has taken the place of a paid vacation.

The Consumers' League of New York city has been bringing pressure to bear for many years that the Saturday half holiday now granted in the big stores might be made a Saturday whole holiday. They pointed to the Hearn store as a successful example of the new policy; they laid stress on the dull business season in the Fifth avenue stores during July and August; most of all they contended that the relaxation from work for two consecutive days and the extended opportunity for rest and recreation during the hot summer months would react upon the efficiency of the workers.

But nobody dared go first. "If they'll do it across the street, we'll do it," said the managers and then they waited for the other fellow.

This year the persistent efforts of the Consumers' League have borne results. Co-operation in place of competition has started the ball rolling and it is believed that other stores in New York city and elsewhere will follow.

"How do we like it?" said the neckwear clerk. "Say, how would anyone like to wake up some morning and remember they can go to sleep again—and get paid for it, too?"

TO NAME A PARK FOR JACOB RIIS

Commissioner John A. Kingsbury of the New York City Department of Public Charities has started a movement to change the name of Telawana Park at Rockaway Beach to Jacob A. Riis Park.

It seemed to him more appropriate that this stretch of shore should perpetuate the name of Mr. Riis, who had given unsparing devotion to its establishment, than that of Chief Telawana, "the last of the Rockaways." Moreover, in all the parks in New York there is no monument or credit given to the man who, perhaps more than any other citizen, drove to plant bits of country in the crowded city districts.

The movement to rename Telawana Park has already brought response. The Association for Improving the Condition of the Poor and other organizations have adopted resolutions favoring the project. The city authorities will be asked to take action.

"Don't let any slip occur in bringing Rockaway Park to the poor 'kiddies' in the tenements, and particularly to the tiny cripples," said Jacob Riis to Commissioner Kingsbury just before he left New York on his last lecture trip.

For eight years Mr. Riis urged that his little playmates, the "children of the slums," were the lawful owners of the sand and sea and sunshine at Rockaway. Then, in 1912 the city of New York purchased the strip of land about a mile long running from Jamaica Bay to the ocean. Part of this has been reserved for public institutions and a public bathing beach. The rest is to be a seaside park with tennis courts, ball grounds and play fields.

THE CARNEGIE BALANCE SHEET OF WAR

TIT FOR TAT, according to the report of the Balkan Commission of Inquiry, has been the deadly policy whereby the nationalities of the Balkan peninsula have been mutually slaughtered and pillaged in the recent wars.

The report, based on corroborated testimony, on the study of documents and on personal observation, is submitted by the Division of Intercourse and Education of the Carnegie Endowment for International Peace. In July, 1913, this division constituted itself an International Commission of Inquiry to study the causes and effects of the Balkan wars. Baron d'Estournelles de Constant, senator of France and representative from France at the Hague Conferences of 1899 and 1907, was appointed president of the commission. Samuel T. Dutton, of Teachers' College, New York, was the American representative.

The conclusions of the commission condemn all. "There was," declares the report, "no clause in international law applicable to land war and to the treatment of the wounded which was not violated, to a greater or less extent, by all the belligerents." The documents of the Bulgarians alone, show that in the war of the allies some little effort was made by heads of the army corps to stop crime against laws and customs of war.

"Dum-dum" bullets which expand when striking the body and deform the wound were used, the flag of truce was violated in several instances, there were cases of bombardment of undefended places, the inviolability of hospitals was abused by all and many prisoners of war were killed and pillaged.

A clause in the international treaty governing war guaranteed by the Convention of the Hague 1907 and signed by all the belligerents, states that "family and home rights, life of the individual (non-combatant) and private property, and religious convictions are to be respected." Yet women of all ages, lit-

ENTRIES FOR STRUMITZA ON THE BALANCE SHEET OF WAR

The springs and some fountains in Strumitza were left unravaged by the Greeks. About one-third of the houses in the town had been demolished after the signing of the treaty of Bucharest, when the Rev. W. W. Cooper, an American missionary from Salonica, came riding in on a donkey covered

with the American flag, and ordered the Greek commander to stop. In this way part of Strumitza was saved.

The children are Bulgarian fugitives from Macedonia. The fathers of many were tortured and killed; their mothers and sisters were raped by the soldiers.

the girls of 9 and old grandmothers of 90, were outraged by the invading armies; goods and property were plundered, and religious conversion was forced at the point of the bayonet.

The report points to the fact that the reflex psychological effect of such crimes against justice and humanity is felt long after the deed itself is forgotten. The murder of 50 persons in one house will undoubtedly warp forever the mind of the 9 year old child, Chrisanthe Audon, who survived the slaughter. The wholesale maltreatment of women, the supreme intolerance, paralleled only in times of the Spanish inquisition, the blow at education and free thought, the demoralizing and unproductive life of the barracks, all these things the report enumerates as adding to the social confusion in the Balkans.

"The extreme barbarity of some episodes," it states, "was a local circumstance which has its root in Balkan history. But the main fact is that war suspended the restraints of civil life, inflamed the passions that slumber in time of peace, destroyed the natural kindness between neighbors and set in its place the will to injure. That is everywhere the essence of war."

The revolting scenes of torture, flames and outrage are followed in the report by a rolling up of figures which in a less dramatic way unfold their stolid, convincing story of the hideous consequences of war. Forty-four thousand, eight hundred and ninety-two dead, 7,824 missing, 104,582 wounded is Bulgaria's cost in human life; 22,000 dead, 25,000 wounded is Serbia's. There are no figures for Greece, Montenegro or Turkey; but in each the totals run into the thousands. Nor do the records in-

clude the victims of epidemics or the hoards of innocent babies, women and peaceful farmers sacrificed.

The property loss is also incomplete. It cannot account for those intangible items, the slackening of production, the suspension of debts, the loss of rents, the business failures, the withdrawal of credit. The only gauge is one of big national estimates. The Bulgarian bank deposits dropped one-third in value from July, 1912, to October, 1912; the receipts of the Bulgarian railways amounting to nearly fr. 30,000,000 from September, 1911, to September, 1912, became non-existent in 1913. The Bulgarian debt has risen during the war about fr. 395,000,000 and in Greece the national debt will be doubled.

Behind these imposing totals lies the real distress caused by the war, the poverty of the farmer whose land has been ravaged, the poverty of the family whose breadwinner is lost or crippled for life, the poverty of the 300,000 Macedonian refugees driven from their homes into Bulgaria and seeking succor of the parishes and the state.

"If," writes Nicholas Murray Butler, president of Columbia University, and acting director of the Carnegie Endowment for International Peace, in discussing the motives for the inquiry, "the minds of men can be turned, even for a short time, away from passion, from race antagonism and from natural aggrandizement to a contemplation of the individual and national losses due to war and to the shocking horrors which modern warfare entails, a step and by no means a short one will have been taken toward the substitution of justice for force in the settlement of international differences."

A PRISON PLANNING TO PREVENT CRIME

THE FIRST STEP in what is described as a program to step outside of the prison walls and meet crime on its own ground—in the midst of society—has been taken by the management of the state prison at Jackson, Mich. An extension work department has been organized with the three-fold purpose of keeping young men out of prison, of aiding paroled prisoners to meet the terms of their paroles and of preventing discharged prisoners from coming back.

Those responsible for the plan liken it to the extension department of a university in that its method will be to go out among the people of the state, instructing them and arousing them to a sense of social responsibility.

Michigan has not been noted for quick acceptance of humanitarian penology. This latest move is significant in that it is conceived and executed by a prison, and its opportunity lies in the fact that the state has no outside agency attempting these objects.

Four years ago Jackson prison was called one of the worst managed penal institutions in the country. In 1909 the Legislature abolished the contract labor system and all but one of the pending contracts at Jackson expired July 1, 1912. The state account system of prison industry came in.

One of the next improvements at Jackson was the establishment, under the régime of Warden Nathan F. Simpson, of a grade and high school department under the direction of the state superintendent of public instruction. The school offers a diploma to prisoners who complete its course and they are then

eligible to enter the freshman class of any college in the state.

Warden Simpson then discovered that the average age of his prisoners is shifting downward. Ten years ago it was twenty-eight; today it is twenty-three. This seemed to indicate lax parental and social influences. Moreover, the management discerned that the attitude of society toward the ex-prisoner is such that he is almost compelled to find his associates among criminals.

In the belief that society must be sharply brought to a sense of its own responsibility, the extension work department was started a few weeks ago. Part of the announced plan is to organize each community to care for its wayward youth and to receive back its paroled and discharged men. The prison will send its chaplain, E. H. Lougher, and other agents into the various communities to lecture on the causes of crime and to effect local organizations auxiliary to the extension department.

Each organization, it is planned, will be induced to study its local conditions, to prevent childhood from coming in contact with such influences as lead to wrong-doing, to save wayward youth from ever coming to prison, and to provide real friends for the man who has learned the lesson of prison life and is anxious to begin life anew."

THE FEEBLE-MINDED WOMAN OF CHILD-BEARING AGE

WHERE is the feeble-minded woman of child-bearing age, not in an institution, to be found? On what basis is she "floating" in the social milieu?

Out of 3,300 cases of suspected mental defect examined at the New York Clearing House for Mental Defectives from January 1, 1913, to February 28, 1914, 474 were women over sixteen. A study of 281 of these women made by Dr. Max G. Schlapp, director of the clearing house, and Leta S. Hollingworth, psychologist to the clearing house, classifies 113 of them as morons (the highest grade of feeble-minded), 105 imbeciles, 26 primary epileptics, 22 moral imbeciles and 15 idiots.

Ninety-four of the 281 were, when referred to the clearing house, living at home, assisting in simple tasks about the house. This is the largest occupational group. Sixty-seven, the second largest group, were in domestic service, employed chiefly by private families, cheap hotels and boarding houses. Twenty-one were engaged in simple factory operations. Twenty were living in orphan asylums, refuges, reformatories, or other institutions. Seventeen are declared to have been prostitutes. The remaining sixty-two were found in eleven different occupations.

These facts reveal strikingly the menace to the community of the feeble-minded woman of child-bearing age. More than half were of so high a grade

A BLIND TITANIA, QUEEN OF THE FAIRIES

A Midsummer Night's Dream was given this year in the dramatic work of the Pennsylvania Institution for the Instruction of the Blind, at Overbrook.

The institution's report holds that the drama not only makes the institution known, but clears up the old impression that it is a "blind asylum" while in reality it is "a boarding school for boys and girls who happen to be blind."

Most important of all, it gives self-confidence to blind pupils, helps them to get around and often completely transforms those who are slow to hear and to observe.

that their defectiveness went long unsuspected. And the greatest number surviving on any one economic basis were found in family life, able to care for their own immediate personal needs, performing simple household tasks and taking care of children.

One hundred thirty-two of the total are declared to have had immoral relations; fifty others were suspected. Thirty-seven were unmistakably afflicted with venereal disease.

Left to their own devices, these women were rapidly adding to the number of feeble-minded in the community. Eighty-nine illegitimate children were found; how many could not be found is a matter of guess. Sixteen were illegitimately pregnant when examined. Forty-six legitimate children were located, making a total of 135 known offspring. The average mental age of the mothers of illegitimate children was nine years.

It would be futile, declare the authors of this study, to indicate item by item what these defective women have cost the community.

SOME VITAL TOPICS AT THE GOVERNORS' CONFERENCE

WHEN the Governors' Conference comes together for its seventh annual meeting in Madison, Wis., June 5-9, it will be the first time that it has met in the central part of the United States.

Two sessions are to be given to a discussion of the uniformity of safety and sanitation laws for places of employment.

Governor O'Neal, of Alabama, will present to the conference the report of the Committee on Rural Credits. Discussion of the state control of natural resources will be opened by Governor Spry, of Utah.

One of the important subjects of the conference will be the uniformity of laws fixing the conditions to be met by foreign corporations before doing business in a state. The discussion on it will be opened by Governor Miller, of Delaware. Administrative problems to receive discussion are extradition and the submission of the governor's recommendations in bill form.

THE COLORADO WAR INTERRUPTS INQUIRY INTO JURISDICTIONAL DISPUTES—BY JOHN A. FITCH

PROBING THE CAUSES OF UNREST—IV

WHEN THE Commission on Industrial Relations renewed its hearings last week its purpose was to inquire into jurisdictional disputes, boycotts on materials, and arbitration in the New York building trades. Instead of the testimony that had been planned, nearly all of Wednesday and Thursday was devoted to dramatic recitals of events in Colorado by actual participants in them.

The regular program involved a rumor that an agreement exists between New York contractors and some of the unions that effectively shuts out competition from other cities in the building line. The contractors in the agreement are supposed to employ only members of New York locals, and the New York locals are supposed to refuse to handle certain kinds of material not made in New York and also to refuse to work for outside contractors.

If such a contract exists no one would admit it on the witness stand. There is a restrictive agreement between the marble workers and their employers, under which the men refuse to set marble not cut under union conditions. The employers declare this a reasonable stand inasmuch as it tends to protect the standards of the industry.

T. E. Carpenter, who represents in New York a Pittsburgh firm manufacturing kitchen appliances and refrigerators, stated that he had had frequent trouble with the sheet metal workers, when installing material in New York. Once, he said, a business agent of the union served notice on the firm that it would have to erect a plant in New York in order to have its materials installed without trouble. Prior to this the New York union had compelled the firm to unionize its Pittsburgh plant.

A representative of the union then took the stand and admitted that he had suggested that it would be a good thing if this Pittsburgh firm would open a New York plant. He denied, however, that he had insisted upon it. He declared that 95 per cent of the sheet metal workers of the country lived in New York and vicinity and that he was serving their interests in trying to get plants to locate in New York. It would be advantageous for the manufacturers, too, he said, because it would standardize their labor costs.

The lowest initiation fee charged by a New York local in the building trades is \$21, in the case of carpenters. If a member leaves the union it costs him \$10 more than that to get back. The fee is \$25 with the structural iron workers and the marble workers. The sheet metal workers charge a fee equivalent to 100 hours work, \$62.50. The Tile Layers' Union appears to have the highest fee of all. A candidate coming

from the helpers' local gets off for \$100, half of which is paid by the local from which he comes. Outsiders have to pay \$200 for the privilege of laying tile in Greater New York.

An interesting witness was Dominick D'Allessandro, president of the Hod Carriers' and Building Laborers' Union, sometimes referred to as "the count" in labor circles. He wears a gold medal given him by the king of Italy, in recognition of his services in fighting the padroni system, and he has the right to print on his card the title "Cavalier."

The building laborers in Chicago, 15,000 strong, belong to D'Allessandro's union. When they finish at one job they go freely to another. It is not so in New York, the commission was told. There are no less than six local unions of building laborers in New York, each doing different and specialized work. No laborer can go from one job to another in a different line of work without joining another union; he needs six different union cards, each costing \$25.

At this point the routine testimony was broken by Hannah Thomas and Pearl Jolley, wives of Colorado strikers who had come East with Judge Lindsey of Denver to see President Wilson.

Both the Colorado women were living in the Ludlow tent colony at the time of the battle of April 20. Mrs. Thomas was arrested by the militia in Trinidad and was held in jail eleven days. When released, she declared, it was without a trial and she was never informed of the nature of the charge against her. This statement was contradicted by a later witness.

Mrs. Jolley told the story of the Ludlow battle as she saw it. She declared that the militia had started the trouble by deliberately attacking the colony. She was in the tent colony all day, and testified that the firing upon the tents was incessant although the men had gone out into the hills. Bullets fell all around her and the heel of her shoe was shot away. A young boy in the colony was shot and killed. Later the Greek leader Tikas was captured by the militia and killed by them.

While Mrs. Thomas and Mrs. Jolley were testifying it was discovered that Edward J. Boughton, major and judge advocate of the Colorado militia, was in the city. He was subpoenaed and went on the stand on Thursday morning.

Major Boughton declared that an attack was made on the militia while Tikas was conferring with Major Hamrock of the militia. There was much excitement that morning apparently and each side suspected that the other was about to make an attack. Tikas had secured from his men a promise not to open hostilities until he could talk with

the major. While he was engaged in the conference, Major Boughton said, the strikers, misunderstanding a maneuver of the militia, marched to a point of vantage and opened the attack. Later, when Tikas found he could not stop them, the major said he was seen to join his men.

The fighting lasted all day. Once the militia were compelled to abandon a wounded comrade in order to escape a fierce attack from the Greeks. Later, when they recovered the ground, the wounded man was found to have been shot several times and his body shamefully mutilated.

When at night the militia finally took the camp, they found out for the first time, he said, that there were women and children in it. They had seen the women escaping early in the day to an arroyo at the rear and supposed they were all gone. They rescued all they could find, he said, although under fire from the strikers in the hills. It was two days later that the pit was discovered containing the bodies of two women and eleven children who, the major declared, the evidence proved had died of suffocation. He admitted that the soldiers had spread the fire in the camp and burned all of the tents to the ground.

Major Boughton admitted, also, that Tikas and two other men were captured by the soldiers and that Lieut. K. E. Linderfeldt had broken the stock of his gun over Tikas' head, and that later all three prisoners were shot. It was not clear, he stated, that all were killed by the militia, but he admitted that the bullet wounds in Tikas' body were caused by the fire of the militiamen.

Major Boughton said he had been sent East by the governor of Colorado, to counteract the false statements that are being made in the press and elsewhere. He stated that he has visited 26 Broadway, the headquarters of the Standard Oil Company, but has not visited any representatives of working people.

In answer to other questions, Major Boughton stated that Troop A, which was principally involved in the Ludlow battle, was made up almost exclusively of company guards. He stated that the mine guards were a source of great irritation to the miners, but he insisted that none of them was employed prior to the beginning of the strike, apparently overlooking the fact that one of the original demands of the strikers was for the "abolition of the notorious and criminal guard system."

When Major Boughton was excused, Judge Lindsey asked if he might be heard. He launched at once into a speech denouncing the mine owners and operators of Colorado. He charged them with criminal disregard of law and with endeavoring to block all efforts to enact measures promoting social and industrial justice.

LAND-LOCKED DISASTER

Will the Wreck of the Empress of Ireland Do More Than the Sinking of the Titanic to Bring in Safety at Sea

NEARLY one thousand people went down last Friday morning with the steamship Empress of Ireland, and were drowned.

It was not in a storm that this tragedy—one of the worst in the history of navigation—occurred. The weather was good.

It was not amid the perils of the high seas, a thousand miles from help, that the ship went down. It was on the St. Lawrence river, and the shore was a mile away.

It was not for lack of means of summoning help that so many lives were lost. The wireless apparatus was in working order, messages were sent and received, boats started to the rescue from nearby points—they could not reach the ship in time.

The Empress of Ireland served well until she met the test. Then she sank in fifteen minutes. With the shore a mile away the ship could not be beached.

Two years and a month have passed since the Titanic sank in mid-ocean with the loss of 1595 passengers. In the first shock the American people with one voice called for action that would promote safety at sea. Federal legislation was proposed, and some of it enacted. Ocean steamship companies voluntarily increased their lifeboat capacity. The company owning the Titanic withdrew a sister ship from service and rebuilt her, to make her safer.

But the bill, sponsored by Senator La Follette, which would do more to promote safety on the water than anything yet done, has so far failed of passage, because of the persistent opposition of steamship interests. It is known as the seamen's bill. It is as much the passengers' bill, for its provisions aim at safety for all.

Under the impetus of the Titanic wreck it passed the House of Representatives, only to be hung up in the Senate later, when the influence of that disaster had begun to die away. It was reintroduced by Senator La Follette in the present Congress and this time the Senate passed it. Now it is again before the House. Is it to be hung up there till Congress adjourns, or will the wind which blew up a wisp of fog on the St. Lawrence last week blow good to unnamed and unnumbered somebodies?

Strong objection to the La Follette

By "Slocum"

UNDER pressure of the demand of the public for speed and size and luxury, marine engineers, builders and managers have given speed and size and luxury. Safety has been a secondary consideration, and whatever may have been done in this direction by exceptional companies has had no binding force upon those willing to take the chances of disaster and profit by them. The maritime law of liability itself has tended to aggravate the tendency to take such chances. Shipowners have failed to work out adequate safety rules just as tenement house owners failed to work out tenement regulation and factory owners the factory laws.

MEANWHILE the Seamen's Union, all but crowded to the wall in the course of the transition from sails to steam, has through Andrew Furuseth long urged upon a reluctant Congress a comprehensive scheme of safety regulation, along with labor legislation affecting conditions aboardship, and the legal rights of seamen.

THE Titanic disaster gave impetus to their movement; thereafter public interest waned and their opponents have been active in preventing the LaFollette bill from reaching a successful issue in the lower house of Congress. Meanwhile, an international treaty on safety at sea has been drafted, which lowers some of the standards now prevailing and which, if ratified by the Senate, will stay the hands of our government for the next six years.

THIS article is written by a former ship's officer, not a union member, but frankly in sympathy with the proposals of the LaFollette bill, both for safety at sea and for the regulation of labor conditions. The recurrence of another great sea disaster calls for a fresh hearing from everybody—and especially from Congress, for the proposals of the Seamen.—
EDITOR.

bill comes from the owners of boats plying on bays and inland lakes who declare that its safety provisions should not be applied to ships that do not go out of sight of land. On this point the sinking of the Empress of Ireland on the St. Lawrence River is a staggering piece of rebuttal.

What is the LaFollette bill, and what will it accomplish? The most obvious need of a passenger, when disaster overtakes a ship, is some means of escape

from the doomed craft. This is the need which the Titanic, slow-sinking in a calm sea, held up to the world. Lifeboats for all are needed, and—equally important—men who know how to lower and control them. This last was the need which the Volturno, burning in high seas, with half helpless friendly vessels standing by, set before all men. The section of the La Follette bill covering these two points reads as follows:

"*PROVIDED*, that no vessel carrying passengers, except those navigating rivers and harbors and the smaller inland lakes, as hereinbefore specified, exclusively, shall be permitted to depart from any port of the United States unless she is provided and equipped with a sufficient number of sea-worthy lifeboats to carry and transport at one time every passenger and every member of the crew licensed to be carried on board such vessel and unless she shall have a sufficient crew to man each lifeboat with not less than two men of the rating of able seamen or higher, who shall be drilled in the handling and lowering of lifeboats under rules and regulations to be prescribed by the Board of Supervising Inspectors with the approval of the Secretary of Commerce."

There is little if any opposition to a requirement of lifeboat capacity equal to the passenger capacity of the boat, for ocean-going steamships. From shipping interests on the Great Lakes, Chesapeake Bay, and other inland waters, however, there comes strenuous opposition. They declare that many of the boats plying in those waters are built for excursion purposes only, are operated only in the day time, when dangers are at a minimum and are so constructed that there is not room for a lifeboat capacity (exclusive of rafts) equal to the loads of day passengers they carry, while the expense of carrying crews to man them would be prohibitive. They state that to require them to meet the provisions of this bill will drive summer excursion business from the water.

Similar objections have been raised by owners of boats whose courses lie altogether within bays, such as the Coney Island and Atlantic Highlands steamships. The La Follette bill exempts harbor craft but does not define a harbor; and shipping interests in New York have had difficulty in getting the federal authorities to clear up the confusion as to the meaning of the term. If the boundary lines laid down in the

pilot rules issued by the Department of Commerce are to govern, these boats would be exempt. Excursion boats plying close to the shore, whether on bays, harbors or the Great Lakes are a different sort of traffic from cabin-carrying passenger boats and the apparent intention of the La Follette bill is to exclude them. They may require different safety regulation, but it should be equally rigorous.

It is difficult to see any reason for excluding Great Lake boats which ply in mid-lake. If they are unsafe when not fully equipped with lifeboats they are a public menace. There are boats running from Buffalo to Duluth, which are frequently out of sight of land, and require several days for the trip. If we refer to the excursion boats alone, there are those running from Chicago to St. Joe,

"—his action in maintaining a high speed and creating a strong draft of air from forward, sweeping the flames aft."

If lifeboats are to be of service there must be men to handle them. The bill provides that there shall be at least two able seamen for each lifeboat, and requires three years of deck service at sea or on the Great Lakes as preliminary to that rank. The shipping interests oppose this provision; they would have some of the boats manned by stokers and stewards. Yet the steward is not engaged for his physical strength. The stoker comes from the fires, from working in an atmosphere of more than 100 degrees, to face an icy wind on deck. He would be in no physical condition to handle a boat.

The opponents of the bill retort that

as overtook the Volturino and the Columbian. Any landsman is able to judge whether thirty days or six months is sufficient training for all these things.

The ship owners grant that the crew should know how to handle a lifeboat, and they recommend an examination, under the supervision of government inspectors, to determine a seaman's fitness. This, they insist, would be a better test than three years' service at sea.

The bill as originally introduced by the seamen provided an examination as an alternative to a time limit, but that feature was opposed by the commissioner of navigation. There seems to be no reason why the La Follette bill would not in addition to its other requirements permit such a test, nor why actual deck service on fishing boats, harbor craft and the like would not be recognized

THE NATIONS AND THE SEA

The International Convention on Safety of Life at Sea drawn up in London is in the hands of the United States Senate. Some question marks might be put in front of the personnel of the conference, and the lack of practical seamen among them is a singular omission. Moreover when thirteen nationalities are gathered together to consider matters of marine interest and welfare, it means thirteen different viewpoints, and thirteen compromises before a general conclusion can be reached.

The convention does two things, undesirable and wrong. It first lowers some of the existing American requirements, such as the wireless provisions. The great boon radio-telegraphy has been to seafaring men and to passengers is well known to every casual newspaper reader. Monuments have been erected to record the bravery and the devotion of wireless operators. American law provides that steamers plying between ports more than 200 miles apart and having more than fifty persons on board shall have two operators and continuous service. By this international convention, only speedy vessels on intercontinental traffic are compelled to have continuous wireless watch and service.

The second and perhaps not so obvious error is the lowering of the lifeboat standards. The English law provides lifeboats for all persons on board, the La Follette bill the same; but the treaty calls for only 75 per cent, the remainder may be provided for with rafts.

But what is of more importance than either of these things is the surrender of the jurisdiction now exercised by the United States over vessels foreign and domestic in our own ports. The treaty would seal up the question of safety at sea for six years after July, 1915. That is, legislation by any country in the interval must be consistent with the terms of the convention. There may be a diversity of opinion about American-Panama toll rights. But there is not, nor should there be, any doubt about American jurisdiction over vessels in our own ports. Port authorities in America now have power to regulate in-coming and out-going foreign vessels. They can say to a captain: "Stop, your vessel is too deeply loaded; your crew is insufficient; you have too few lifeboats."

The international treaty would prevent port authorities from exercising this power with respect to safety provisions superior to the low minimums set by the treaty. The United States might pass higher and more expensive standards as to its own ships, but that would merely put such vessels at a disadvantage with the vessels of other nations. It is entirely reasonable for the nations to covenant as to the minimum safety standards which shall be enforced in all seas. But they should not tie the hands of any nation which in the name of safety may set higher standards for all vessels coming to its ports. The Titanic disaster led in two years to a revolution in safety concepts as to lifeboats. If this treaty is enacted, no lessons growing out of the disaster to the Empress of Ireland could be effectively applied until 1921.

Michigan, which cross Lake Michigan, during the season, twice each day. At the middle of the voyage they are more than an hour from land. What would happen at such a point if there were a collision, or fire broke out, and there were not enough lifeboats?

The critics of the bill would have us believe, apparently, that ships on inland waters can be run to shallow water and beached, in case of disaster. Could they beach a vessel that caught fire in the middle of one of the Great Lakes? The Empress of Ireland went down, a mile from the banks of the St. Lawrence. The captain of the General Slocum which burned ten years ago in the East River with the loss of a thousand souls tried to beach the ship—and with what result? The commission that inquired into that disaster reported as a cause of the spread of the fire:

an able seaman on a modern steamship knows no more of boats than a steward. If this is true are not the ship owners criminally negligent? Able seamen should be trained to meet an emergency.

At present anyone can be put aboard an American vessel, and called a sailor. The shipowners have contended that steam navigation has killed sailorizing and that it is a thing of the past. One such at the Senate committee hearings claimed he could make a steamboat sailor in thirty days. Another contended six months was sufficient. A steamboat sailor steers the vessel, keeps a lookout, paints and cleans woodwork, rigs stagings, slings weights, repairs awnings and deck gear, washes decks and keeps the ship clean, handles lifeboats and is supposed to be able to row and save himself and the passengers in the event of a wreck, or such a disaster

under it as well as service at sea or on the Great Lakes. The provision of an examination seems no sufficient reason, however, to shorten the time requirement. Such a test would probably be made in a quiet harbor in smooth water. It is incorrect to state that three years' service on deck at sea will not provide opportunity to gain experience in the handling of boats. There are many harbors, the world over, where ships lie safely at anchor, but where the waves are frequently high. That is true at Liverpool, in the mouth of the Mersey, it is true in San Francisco Bay, and in Hampton Roads.

England, Germany, Norway, Australia and New Zealand say three years' experience is needed to make a sailor, and they have passed laws to that effect. The provision in the La Follette bill on this subject would merely bring

us up to the standard of these countries.

Sufficient lifeboats for all and trained seamen to man them are necessary safety provisions. These will be of little avail, however, if the seamen do not understand the language spoken by their officers. The bill, therefore, provides that within five years from the passage of the act sixty-five per cent of the crew on vessels flying the American flag shall be able to understand English.

England, France, and nearly all the European maritime nations have what is popularly called a language test. The lives of the passengers and the crew often depend on a seaman's intelligent knowledge of the commands of his officers. As a proper safeguard to all on board the men who man the boats should be able to understand the language of their officers.

The manning scale, seamen's efficiency and language tests are all vitally connected from the standpoint of safety, for the deck crew man the lifeboats in case of disaster at sea, and on their skill, strength, and gallantry depend the lives of the passengers. The promoters of the bill hold that there is a further question of large public policy at stake in them.

The white men—English, American, Scandinavian, and in a measure the Latins—are forsaking the sea. The Lascars, natives of East India, Chinamen and Japanese are growing in numbers in vessels carrying passengers. The reason usually given for their presence is that white labor is not needed.

In the last analysis the real reason for the presence of Asiatics on American steamers is that they are cheap. The yellow seaman has many virtues; chiefest of all is that he costs a third less than a white sailor. In no industry has the pressure of competition by Oriental labor been felt by American workmen so keenly as in shipping. That the opposition is not confined to the men is shown by an annual report of the Imperial Merchant Service Guild, an organization of ships' officers. The following statement appears on the subject of the conduct of Chinese crews:

"Time was when an Oriental crew was looked on by captains and officers as a blessing, owing to their docility and obedience. Drunkenness was unknown, and the authority of the officers was unquestioned. But there has been a metamorphosis. From many reports received from members, Chinese crews are the principal offenders, and sundry instances of murderous assaults, insolence and insubordination have been brought to our notice during the past year; in some cases, but for the timely aid of other members of the crew, officers' lives might easily have been sacrificed. Many cases have occurred recently of mutiny with these crews on the high seas, and officers and engineers have had to resort to desperate means to defend their lives."

The promoters of the bill contend that the natives of a country have a right to a place on their own ships. Seamen are needed as a second line of defence; the United States navy is short of men. Germany can remain her navy without trouble because of her efficient training of seamen. France has a dependable supply of seamen at her command.

The opposition to the language test comes from the Pacific steamship companies who now employ Chinamen and Japanese. They declare that with the higher wages they would have to pay to English-speaking seamen, they would not be able to compete with the Japanese vessels.

The *London Times* in an editorial on the opening of the International Conference on Safety at Sea, said: "The risks of the sea are too varied and great for human ingenuity to overcome completely." True enough, legislation cannot remove the dangers; but it can minimize them. A passenger vessel with several thousand souls on board is a hotel afloat—a hotel at sea exposed to the dangers of the deep, such as fire, collision, and the unseen hazards of the sea. No complete list of the human lives lost at sea is kept anywhere. But an incomplete list shows that in ten years over 6,000 souls have been lost from passenger vessels alone.

So much for the obviously safety provisions. The bill also provides for improved conditions for the sailor. With the increase in efficiency and moral fiber that comes with economic advancement, as the history of shore crafts well demonstrates, these features also may well be regarded as safety provisions.

Briefly, the bill proposes to establish a standard of efficiency, improve the living quarters of seamen, abolish advance notes, and give the sailor a fair share of his wages upon reaching a port. The *New York Evening Post* commenting on the measure says:

"On the side of the sailor it is highly unfair that he, of all workingmen should have no more rights than a minor. He is not allowed to come and go if conditions do not appeal to him like any other laborer, and he is not permitted to possess the money he has earned except at the end of his contracted voyage, no matter how many ports he may in the meantime have visited. In fact, the seaman is scarcely a man before the law, and the very irresponsibility which these measures are intended to guard against is largely the result of such measures themselves."

Important scientific study has been given to the relationship between fatigue and efficiency. The La Follette bill seeks to prevent a seafaring man being worked whether by long hours or laborious toil up to the point that fatigue renders him inefficient. The hours a seaman must work in port is a matter the captain decides absolutely. If the

seaman refuses to work in port, he is liable to fine and punishment. The hours of officers have been regulated, so that a comparatively fresh man is on the bridge when the ship leaves port. Why should the seaman not have the same privilege? On shore there is legislation for railroad men in every state in the union, limiting their hours of work in the interest of public safety. Why are we less concerned about safety at sea? A sailor benumbed with cold and stupid for lack of sleep is a danger to navigation and passengers.

A stoker's work in the bowels of the steamer is exhausting, disagreeable and done under depressing conditions. In the hearings before the committee there was much discussion about ventilators, temperature and men collapsing through overheating. It is easy to look down from the fresh air on deck into a fire-room and theorize. Any work that uses up men as stoking does requires consideration.

One fireman's evidence before the congressional committee was convincing: "Coal is coal, and when you are shovelling it, you are shovelling it, no matter where you are." It is hard work anywhere, but when the temperature is above one hundred degrees, it is almost beyond human endurance.

What the La Follette bill proposes for the seamen is little enough. It provides a three watch system for the stokers which would involve four hours of labor followed by eight hours of rest. For the deck hands it provides "watch and watch," that is, four hours on duty followed by four hours of rest.

The worst "snag" which the seamen have encountered on the labor provisions of the bill have to do with reforms which would secure greater freedom for the men. These provisions would give seamen the right to one-half their wages in port, and abolish the advance note. The "advance note" as its name implies is a note given on a seaman's wages in advance of earning them. On American coastwise vessels, there are no advance notes. They were abolished and with their abolition went many of the abuses that had gathered round the coast seaman's life. An advance note is an invitation to rob a sailor.

A hard-up sailor can get a boarding-house master to advance him a few dollars if he will sign over to the boarding-house master his first month's wages on a ship to be found for him. The boarding-master arranges this through the "crimp," a labor broker. The crimp obtains the ship; in twenty-four hours the seaman is off to sea, his first month's wages gone. The proceeds are divided between boarding-master and crimp. Because the sailor had the power to sign away his wages, the boarding-master and the crimp were interested in him. When the sailor has no power or legal right to sign away his wages,

the waterfront parasites, crimp, boarding-masters, tailors and saloon keepers let him alone.

The offence does not usually become known until after the seaman is at sea or discharged in a foreign port. The captain of the ship, and witnesses are then beyond the jurisdiction of the courts, and have scattered to the four winds. In abolishing the "advance note," the La Follette bill is getting at the root of crimping and kindred wrongs in a sailor's life.

A sailor's wages when accumulated in the hands of the captain become then a temptation to an unscrupulous man, a whip to crack over the head of the sailor. It is a fundamental cause of desertions from foreign vessels in the ports of the United States and from American vessels in foreign ports.

Consul Mayer at Buenos Aires says:

"I attribute the unusual number of desertions to the law of December 21, 1898, which reads:

"Every seaman on a vessel of the United States shall be entitled to receive from the master of the vessel to which he belongs one-half part of the wages which shall be due him at every port where such vessel, after the voyage has commenced, shall load or deliver cargo before the voyage is ended *unless the contrary be expressly stipulated in the contract.*"

"In my opinion, which is based upon observation, if the words in italics were not in the contract, desertions would not be so numerous, for the following reasons:

"Most of the American vessels coming to this port sail from Boston, Mass. There the shipping articles are signed by the seaman before the United States shipping commissioner.

"On the front page of such articles, towards the bottom of the page, I find in almost all shipping articles the following words stamped: 'No money to be advanced during the voyage.'

"The seaman, once the vessel is in port, will ask permission from the master of the vessel to go ashore, which permission is granted for twelve hours. He will ask for some money, which is refused, the master of the vessel claiming that the shipping articles which the seaman signed provide that no money shall be advanced during the voyage. The seaman goes ashore without a dollar in his pocket. He falls in with runners of boarding houses and shipping masters, by whom he is taken care of, by being provided with liquors and eatables. In many cases the seaman gets intoxicated and does not return to his vessel, and at the expiration of the forty-eight hours from the time his permission to go ashore ceases, the master promptly reports him a deserter.

"The vessel remains in port discharging and receiving cargo for about two months, and as the seaman has little or nothing to do,—the cargo being all discharged by stevedores,—by the seaman's deserting the master or ship saves the wages, and I never knew of a mas-

ter who worried about a deserted seaman. The shipping master takes hold of the deserter and soon finds another vessel for him (not an American vessel) and collects one month's allotment for board due him by the seaman. The ship saves from two to three months' wages by the seaman deserting. The shipping articles further provide that these seamen ship for from twelve to eighteen calendar months, and the first time they learn they can draw no wages is when they ask the master for money when the vessel is in port, and it is hardly to be expected that they will stand by their ships when they can be kept out of their wages for twelve to eighteen months."

There is no moral, economic, or commercial reason why a sailor should not have his wages when they are earned. The assumption has been that accumulated wages tied a man to his ship. The withholding of a sailor's wages has never kept them on board their vessel; on the contrary it has driven thousands ashore into the clutches of the crimp, as evidenced by Consul Mayer's report. Sailors have risen in character, conduct and efficiency as they have obtained power over their own wages. The withholding of a seaman's wages is a relic of barbarism, one of the unworthy traditions of the sea. The right to half his wages in any port will solve many of the economic problems in a sailor's life, brighten his social condition, teach him to be self-reliant, wipe out the methods by which the crimp and the boarding-master get their power, and lessen the powers for oppression at the hands of unscrupulous ship-masters.

A sailor can be arrested as a deserter if he leaves his ship; no matter what the conditions are. Seaman are thus the only class in America who may be punished for the violation of a civil labor contract.

ANDREW FURUSETH ON THE EMPRESS OF IRELAND DISASTER

There is nothing in the London Convention on Safety of Life at Sea that would have prevented the disaster in the St. Lawrence River or minimized it. The Empress of Ireland was up to the London standard in construction, equipment and manning. If the convention had been in force, she would have left Quebec in exactly the same shape as she did the day before she sank, except that a lot of her waiters, cooks, coal passers, etc., would have been rechristened "certified lifeboatmen"; indeed, her crew might have been less effective by failing to understand the language of the officers. She might, under the convention, have had a crew of East Indian coolies, South African Negroes, Malays, or Chinese, to whom orders would be transmitted through interpreters. To this extent her crew, poor as it was, was above the London standards.

A deserting seaman can be held in an American prison, sentenced to a term in prison or delivered back to his ship, for the simple act of leaving the service of an employer. The treaties that give captains such power should be abolished by the usual process in such matters. A foreign sailor should have the right to leave his ship in an American port if he wants to, and claim one-half of his wages. The forfeited wages would more than compensate the owner for any trouble and expenses in supplying the place of the quitters. The passage of the La Follette bill will end this practice and make sailors free men. Our government will then cease to be a slave-catcher for foreign vessels.

What effect will this have on foreign shipping? The master of an English tramp ship signing a crew for a voyage from Hull, England, to Norfolk, Va., after the passing of this act, will be obliged to consider the conditions prevailing at his destination. At Norfolk, he would have to pay the wages in vogue at the American port, or lose his men. The Norfolk wage is probably 30 per cent greater than that of Hull, just as the cost to the American workman, ashore or aboard ship, to keep his family, is greater.

The bill would thus remove the present 30 per cent wage handicap on the American investor who wishes to put his money into an American vessel, carry American goods under his own flag, and employ American sailors at American rates. It would remove the present pressure upon American sailors to leave the sea, as a calling which a man can't follow his life through and rear a family. Wages would then be no barrier to the growth and operation of American vessels. As things now stand, the Standard Oil Company, for example, sails its fleet with few exceptions, under foreign flags in order to ship its men at the sub-American wages paid in foreign ports.

The safety provisions—setting a three years' apprenticeship to seamanship, and requiring a far greater proportion of skilled men than heretofore,—would be equally powerful in lifting the general status of the men. Individually and collectively, they would be stronger to bargain with their employers. For that reason the bill is opposed by the shipping interests. For that reason American students of what organization has meant for transportation on land, in lifting the standard of life and labor for the men who make up the railroad brotherhoods and for the families dependent on them, should favor it.

At a blow, the LaFollette bill will enhance safety at sea, remove the handicap of labor costs under which American shipping interests now suffer, and improve the conditions of sailors all over the world.

The Making of a Russian Revolutionist

An Interview with
Marie Sukloff

By *Winthrop D. Lane*

Copyright, 1914, by Survey Associates, Inc.

MARIE SUKLOFF

At twenty-eight, one of the most feared of Russian Revolutionists, now in this country.

BENEATH the branches of a Russian forest, in the province of Vilna, a group of the czar's subjects are gathered under cover of a pitch black night. They have come singly and by stealth. In America the meeting would have been advertised and the place would have been a public hall, with everyone invited. But in Russia you are sent to jail for what you think.

Now in whispers, now in the louder tones of excitement, members of the group step out and address the others. We know what they are saying. One of them begins with a taunt at the autocratic power that would close their lips and bind their brains. He rushes on to a description of the condition of the Russian workingman, and we hear the equivalents for "exploited" and "disfranchised." One exclaims against the lot of the peasant, and the word "serf" comes from curled lips. Another refers, with bitter irony, to the generous "emancipation" of the peasants by Alexander II in 1861, and asks if the new extortion of the state has proved more beneficent than the old extortion of the landlord. "And remember," he shouts, "your masters may still beat you under sanction of the law."

Just beyond this circle, where the lights cannot carry, two small girls are crouching behind the trunks of trees. No one knows they are there. They have

come after the others and will leave before they disband. They are only twelve years old.

Tomorrow they will organize a similar meeting among their playmates. No one pays any attention to the actions of children; they will not have to meet at night in a forest. A neighboring field will be exclusive enough. There, in form and substance, they will reproduce the speeches of older heads, adding the humor of their own naive grappling with big words and bigger thoughts. But they, too, are in earnest.

A Refugee

One of these two young girls is now in this country. She is a refugee from Russian "justice," an escaped exile. It is only sixteen years since she first crept through the night to one of those secret gatherings, and yet in that time she has grown from an eaves-dropping child to one of the most feared revolutionists in Russia. The fiery denunciations to which she listened under the sky were the fuel which later blazed out into revolution, and when that came it found her armed, ready to add to the flames.

Twice sent to Siberia for life and twice escaped; defying the courts of law at the age of sixteen; for three years kept in solitary confinement, and for four and a half imprisoned in the stronghold of Akatui with some of the most famous rebels since the Reign of

Terror; making her way 300 miles through a Siberian winter with a three-year-old baby in her arms: these are bits of her history. Her name is Marie Sukloff. It is now two years and a half since she is said to have crept between a sentry's legs and dodged her million-eyed pursuer until the Manchurian frontier was safely crossed. She reached America six months ago. A few weeks with Jane Addams at Hull House and a few more with Lillian D. Wald at the Henry Street Settlement, New York, induced her to accept this country as her present sanctuary, and she is now living on the upper west side of New York city.

When I first saw Miss Sukloff I did not know who she was. The thing that impressed me most was her vivacity of manner; after that, her eyes. They are not what Galsworthy would call mesmerizing; they are straight, searching eyes, but kind also. Her smile is the sort that seems to light up a dark room. Her cheek bones are high, and her cheeks, in spite of prison food and hunger strikes, look fresh and healthy. Her expression is intense and earnest, the effect being heightened by a small dark braid of hair which lies upon her head like a low wreath. You do not have to talk with her long before you find yourself thinking she is beautiful. Her fingers are small, but they do not taper like an artist's. Neither are they those of

a farm laborer, though she has been one. They come to abrupt ends, so that one may imagine a similarity between her fingers and her ways of thinking.

Miss Sukloff speaks English with many apologies but understands it well. So alert is she mentally that often she grasped the meaning of my questions before they were fully phrased and answered in Russian without waiting for them to be translated.

Her Education Begins

Her appearance of kindness and sympathy does not belie such glimpses of her nature as I was privileged to obtain. At one of our interviews she discovered that the interpreter had had no breakfast and the proceedings were summarily, though graciously, adjourned. Another of her characteristics is not usually associated with persons of revolutionary views. She has an intense love of accuracy. If she is not sure about a thing she does not like to say it. Several times I asked her about distances in Europe and each time she begged that I go to a map and make certain that her figure was right before printing it.

Respect for other peoples' property is another of her traits not usually attributed to revolutionists. When our interpreter, who with her kindly agreed to go over the first draft of this article, seized an eraser and started to rub out an inaccurate sentence, Miss Sukloff snatched the eraser from his hand and, as he confessed to me later, lectured him roundly on the impropriety of tampering with another's possessions in the owner's absence!

But let us return to Vilna, where revolutionists are made. "On the banks of the Neva, the Volga, and the Vistula," writes Anatole France, "the fate of new Europe and the future of humanity are being decided." In the days when Marie Sukloff was gaining her first impressions of the tyranny of Nicholas II, the world knew little of the forces that were destined to shake his throne, and to implant new courage in the breasts of those who dreamed of freedom.

In a small village forty-five miles from the city of Vilna, in the Russian Pale, Marie was born twenty-eight years ago. Her parents were hard-working, orthodox Jews. To extract a scanty living from their farm of twenty acres used up all their energy of mind and body. Their implements were primitive and a large family, six children besides Marie, depended on their efforts. They were ignorant people, living, like all peasants, in constant fear of the government.

Marie was a frail child. A little taste of schooling gave her an appetite for more, so that she became eager for an education. But she was needed at home. There were younger children to look after, and even a little girl can do some

work in the fields. So she was taken from school.

One day she and her chum did something very wicked. They didn't know how wicked it was, but it was bad enough to add spice to dull lives. They knew that her chum's sister belonged to some sort of secret group of people who seemed to know things nobody else knew, and who circulated small pamphlets among themselves, which they guarded very carefully. Marie's chum learned where her sister kept these pamphlets and they decided to steal one and see what was in it.

The first they read contained a vivid description, in Yiddish, of the conditions of the Russian workingman. It was so interesting they stole another. The second described the serfdom of the peasants. Much of it they could verify from their own lives, and it set them thinking.

For some time they continued to steal these pamphlets, which had been printed secretly and were supposed to be kept under lock and key. Then one day their courage took a new step and they decided to go to one of those night-meetings in the woods, of which they had heard. This was more thrilling still. There they heard things which filled their thoughts in the day time, while they worked, and gave life a new color.

After Marie and her chum had listened to a few of the secret meetings in the woods, they organized their day-time imitations of them. Choosing the more adventurous among their companions, they called themselves the Jewish Little Bund, patterned after the real Bund to which the chum's sister belonged, a well-known revolutionary organization with branches in many places.

What She Read

The things they read and heard began to make them look about a little more closely at the conditions of their own life. Marie began to compare the way her parents and other poor people lived with the way the rich people in the village lived. She saw other girls going to school and not having to work as she did. At first it only made her unhappy, but presently she began to think that there was some cause back of it all.

Then some one put a book into her hand and soon Tolstoi, Turgenieff, Gogol, Goncharoff and Dostoyevsky were helping to form her ideas as to the nature of that cause.

In this way things went along for several years. Marie's parents knew she was meddling with unconventional ideas and remonstrated. But their objections never went as far as punishment, and she was not deterred.

Slowly she built up an objective view of the Russian peasant, coming to see him not as the stolid and half-imbecile adorer of czar and church which he has been so often painted for foreign eyes,

but as the oppressed and harried subject of unscrupulous autocrats. She saw his independence of the priesthood, and began to think that if he went to church with suspicious regularity it was because church was the least ugly place to go to. She saw his activity in town meeting and believed she discovered in him a genuine capacity for co-operation with his fellows. In the village commune she saw his aptitude for economic union.

The Russian Peasant

She began to realize that if he was ignorant, it was because his government kept him so. His refusal to use modern farm machinery, which is so often pointed to as indicating his mental stodginess, she began to see as mere inability to buy it. But above all, these things, she began to see the part which the half million Cossacks of the czar play in his life. Few are the villages, she learned, which have not at some time or other been beaten by these hirelings into submission and terror. Picture the effect on her impressionable mind of such an order as the following, issued by a "land official" and directed at the peaceful residents of an ordinary village:

"Nobody shall leave the village at night at all, or in the day-time for more than twenty-four hours without reporting to the selectman where he is going and for what purpose. For any departure without permission the guilty one shall be punished. Anyone who departs at night is to be reported in the morning by the watchmen and sentinels to the selectman, who is to inquire into the matter and punish disobedience, even if it be proven that there was nothing suspicious or improper in the departure."

Gradually she learned, also, that the peasants of Russia were awakening. She found that for a score of years there had hardly been a time when some village was not in revolt. But long distances between centers of population, inadequate communication and the ubiquitous Cossack had kept rebellion from spreading.

Then she was told of the origin of the revolutionary movement—how it had begun within the memory of her own father and consisted at first of academic discussion among students in the universities and technical schools, but presently took the form of secret societies whose members, under the disguise of doctors, midwives, school teachers, governesses, factory hands and common laborers, went among the people with seditious pamphlets and oral arguments, seeking to make proselytes. When success began to attend these efforts, she learned, the police interfered and there were wholesale arrests of those who

¹Quoted from Russia's Message, by William English Walling, page 169.

GERSHUNI

One of the fighting inner circle of revolutionists. Miss Sukloff helped to nail the lid on the barrel in which he escaped from Akatui.

"THROUGH STRUGGLE YOU WILL GET YOUR RIGHTS"

The group of prisoners at Akatui who met Miss Sukloff and her companions at the time of her second exile.

SOSONOFF

Slayer of Von Plehve. When ten of Miss Sukloff's companions in Akatui tried to commit suicide, Sosonoff alone succeeded.

preached anti-government doctrine. Many, she learned, were imprisoned or exiled, and so she came to have an especial horror of a power which would not permit people to express their own views, or even to have views of a particular kind.

These were precocious ideas for a girl of sixteen, but poverty and thwarted ambition often put an edge to intelligence. By dint of learning such things Marie had become a hater of czarism and an avowed Socialist. As such she was lonely in her home town. So she moved to Odessa for the purpose of meeting other and older radicals. The Socialist Revolutionist Party, which was the first to adopt terrorist methods, had been formed the year before. Marie met many of its members, including Catharine Breshkovsky, the "grandmother of the revolution," who was one of its founders. She had gone so far in her own thinking that it was easy for her Odessa friends to persuade her to the philosophy of the new party. When she joined it within the year she was the youngest of its members. At this time she was a revolutionist in theory only, not yet ready to begin actual warfare on the government she had come to hate. But events were at hand which were to bring the transformation.

A Batch of Letters

Among the friends to whom she was writing was a former playmate whom the military requirements had taken away and put in the army. He, too, was a Socialist. For some reason the army officials suspected this young man of holding ideas unfriendly to the government. They searched his possessions and found a year's letters from Marie.

In one of these letters she had written, in Yiddish: "I shall not rest until

I see the blood of the vampires." She blushes now at the recollection. It was a bit of youthful bombast of which she is not proud; in bad taste rhetorically, she thinks. By it she meant merely to express her hatred of all oppressors.

But the official translator, in changing the letter into Russian, made "vampires" read "vampire." This was construed as a direct threat at the czar. That alone would have been sufficient to brand her as too dangerous to be at large, but the officials had another clue.

First Arrest

Each year, on the third of March, the revolutionists of Russia commemorate the famous "emancipation" of the peasants which Alexander II was forced to make in 1861. The beneficence of this liberation was somewhat dimmed by subsequent events and it wasn't long before the peasants were calling their vaunted freedom a mockery and were claiming that they were being systematically cheated of the promises made to them. In harmony with this spirit the celebration of the revolutionists takes the form of posting proclamations, on the anniversary of the manifesto, contrasting Alexander's pretentious pledges with the present condition of the peasants.

Marie had been involved in this work. The government searched her house and found forty pieces of type which, on comparison, proved to be from the very supply that had been used in setting up some of these proclamations. So, on February 21, 1902, she was arrested at Kishineff and thrown into prison to await her trial.

At that moment the revolution was only four years off. Up to this time Marie's activities had been only those which pass uncensored in most civilized countries. Yet with unconscious cer-

tainty the sinister power of the czar was grinding out another revolutionist to join the makers of terrorism.

For eighteen months before her trial Marie was kept in solitary confinement. Day and night continuously she was cooped up in a square cell that measured six of her steps each way. Fifteen minutes of every twenty-four hours she could change the scene of her pacing to the prison yard.

She shudders now when asked what passed through her mind during that year and a half. For four years she had been reading and seeing much of the lives of her countrymen and of the tyranny of her country. Now she could think it all through, sort it out in her mind, which, though still that of a little girl, was being swiftly matured by experience beyond her years.

Her Mental "Coming of Age"

This was the period of her "coming of age" mentally. It was this first arrest, imprisonment and trial that made Marie Sukloff an active revolutionist. When she came through it she was ready to take up arms against a power which she believed to be crushing out the best that was born in millions of men and women. Her own lot, she saw, was not unique. The revelations which led to her discovery had implicated others. In the same prison were two hundred men and forty women whose offenses, like hers, were that they "thought too much." From them she heard stories which made her clench her hands and grit her teeth.

The food in this prison was bad. So Marie and her fellow prisoners organized a hunger strike. The strike lasted ten days and ceased when better fare was promised. But the promise met the fate of many Russian promises—it was

broken. The meals did not improve. Meanwhile two men died as a result of the strike. The Russian government had not begun to resort to forcible feeding at this time. That practice has come in since, "but even the Russian government," says Miss Sukloff, "regards it as one of its extremest punishments."

Finally her turn for trial came. Among the counsel for defense was Maklakoff, a brother of the present reactionary minister of the interior, who defended Mendel Beiliss free of charge. Pereverzeff, Kalmanovitch and Ratner, three of Russia's famous lawyers, were also among her counsel. All defended her for nothing.

Exiled at Eighteen

The evidence was presented and the form question put: What will you do if liberated? She did not give a form answer. Though fresh from her prison ordeal and now scarcely eighteen years old, she arose, facing the judge, and said:

"I will do my utmost against you and to change the awful conditions in Russia."

The court pronounced her a "dangerous, revolutionary person." The usual punishment for her offense was eight years at hard labor. But Marie was young and the court took pity. Her sentence was commuted to life exile in Siberia.

But she was not allowed to start at once. Now that she was disposed of so satisfactorily, it was no great matter to the government whether she set forth immediately or went back to her lonely Odessa cell. Besides, the facilities for travel to Siberia were overloaded just then with hundreds of other political prisoners. For another year and a half she lay in solitary confinement in Odessa, and then she began the immemorial march to Siberia, first made by the priest, Avvakum, in 1658 and increasingly trod ever since by the feet of religious and political nonconformists, until the yearly average of exiles has swelled to 20,000!

It was to the village Alexandrovskoye, in the district of Yeniseisk, 3,000 miles from home, that Marie was sent. The nearest railway station is 150 miles distant. There she was free to move about and live much as she chose, though under constant surveillance by government officials. It was bitterly cold, for Alexandrovskoye is nearly on a line with Sitka, Alaska. Many of the villagers were prone to regard all exiles as dangerous and bad, so her prospects for companionship seemed slight.

The government gave her eight rubles a month, or four dollars, for living expenses. The vigilance of the officials toward her, very constant at first, was

relaxed as the days went by. She seemed too young and timid to escape. Once again the government was being blind. It had made her a revolutionist; it did not know to what lengths she would go.

In planning her escape Marie tried to persuade an older couple, her friends, to escape with her. But the presence of their little child, who had suffered banishment with its parents, would have led to their almost certain capture, and so they refused to accompany her. Then Marie offered to take the child with her and return it to its grandparents in Vilna. After much hesitation the parents consented.

Of the details of her escape Miss Sukloff will now tell little. She is re-

GERSHUNI AND SPIRIDONOVA

serving that part of her story for a book. One night, three months after her arrival at Alexandrovskoye, she was helped by peasants to get safely out of the village. "It is the peasants who make possible so many escapes of exiles," says Miss Sukloff. "Everywhere they are sympathetic with the revolutionists."

But to be safely out of the village was only to begin her hardships. The cold was bitter, and she had a three-year-old boy to care for and keep warm. She had also one hundred rubles, fifty dollars, the gift of friends and her father. This was not enough to enable her to cross the border into China or to flee to Japan. For in those countries she did not know where to find the friends who would have enabled her to return home.

So her only recourse was to turn back toward European Russia. Fifty dollars would not pay her railroad fare. Besides, railroads are in the hands of the

government in Siberia. They might be watching for her on the trains.

She started to walk home, but again the peasants came to her aid. For fifty cents they let her ride a long way in their carts, and this became the chief mode of travel for Marie and her young charge. Much of the journey was made at night. Villages are few and far between in Siberia and the peasants, when going to market, often travel day and night without coming to one. So huts have been built along the road as way stations. In these Marie slept sometimes, but often a whole night was passed in the cart, sleeping or pushing on.

She often told who she was, but no one refused to help her. She can smile now at the recollection of the chubby face of the little boy who learned during those four terrible weeks to look to her as to his mother, and on whom she expended a mother's care and protection. But there were moments while they bumped over the rough roads, or lay awake on the carts at night, when she wondered if either would reach the goal alive.

On to Paris

For three hundred miles Marie traveled in this fashion. When she reached the city of Krasnoyarsk she had just money enough to buy a railroad ticket home. By this time she believed it was safe to trust herself on the train, and so she spent her last forty-five rubles that she might restore the child more quickly to its own people.

But Vilna was no place for her. Aside from the danger of capture, she felt that she must get away. Most of the plans of the revolutionists are formed outside of Russia, and in those plans she wanted to have a part. Imprisonment and exile had made this girl of nineteen a more impassioned champion of the Russian poor.

So she decided to go to Paris, where many of her fellows lived. Poor as her father was, he supplied her with enough money to steal across the Austrian border at Brody and go on to the city of the Bastille and the massacre of the Champ de Mars.

In Paris she met for the first time Azeff, general organizer of the fighting inner circle of the Socialist Revolutionary Party, who directed the attacks on Plehve and the Grand-duke Sergius. She became his devoted friend, so that today her voice breaks when she tells of his exposure as a betrayer of the revolutionists. The story, as Miss Sukloff tells it, has dramatic features not generally known.

The unmasking of Azeff came in 1907. For some time before that officials of the police department, sympathetic with the revolutionists, had been writing anonymous letters to revolu-

tionist leaders, telling them that some one within their organization was betraying the names of those who assaulted ministers and giving other secrets away to the department. The purport of these letters spread among the inner ranks of the revolutionists and caused each one to look with suspicion on his fellow. Azeff went to the director of the department of police, Lopukhin, and urged him to deny the letters. When Lopukhin showed little sympathy, Azeff threatened to have him killed if he didn't grant his request. Lopukhin's reply has become famous on the lips of the revolutionists, as showing that the head of the czar's repressive system, on which, Miss Sukloff says, more money is spent annually than on the whole system of education, was at heart himself a revolutionist. "That's enough," said the director of police. "You have shed blood enough. I will put a stop to it."

Lopukhin went immediately to Paris and in person laid before the revolutionary leaders the whole treachery of Azeff, even to the details of their last conversation.

For this Lopukhin was sent to Siberia, though the czar pardoned him later. Azeff disappeared. It has since been stated in European newspapers, says Miss Sukloff, that he is a spy for the Austrian government and has discovered important Russian military secrets for his new employers.

The Approach of Revolution

Miss Sukloff reached Paris in August, 1904, and stayed there nine months. She became an active plotter against the government, a career which was soon to put the weapons of war into her own hands and to send her once more across the Siberian border, at a moment when popular rebellion was assuming proportions which were to shake the Empire. Reverses in the war with Japan, begun in February of that year, were fanning the flame of opposition which had been directed against that conflict from the start. A few weeks before Miss Sukloff reached Paris, Sosonoff's assassination of the minister of the interior, Plehve, was hailed by the European press in ways which have led it to be called the most popular terrorist act ever committed.

In November, two months later, a congress of members of the provincial and municipal assemblies, permitted by the tacit consent of the police, approached the crown with a suggestion for an extension of self-government and wider guarantees for individual liberty. The day on which the deputation laid these requests before the new minister recalled the fifth of May, 1789, when the French States-General met at Versailles. But the imperial ukase of De-

cember 12 enunciating reforms contained no word of constitutional government and failed to satisfy public opinion. Continued petitions from all sources were accompanied by widespread agitation, and this culminated at Moscow in the murder of the Grand-duke Sergius on February 4, 1905.

Even that failed to impress the forces of reaction. The murder of Sergius was answered within two weeks by a reaffirmation of the principle of autocracy. The new minister of the interior, with a better knowledge of the effects of such flaunting, hastened to the czar and obtained on the same day the issue of a rescript which stated the emperor's intention of summoning representatives of the people to aid in "the preparation and examination of legislative proposals." A commission was formed to carry this promise into effect.

Miss Sukloff's Part

With events in this stage, Miss Sukloff returned to Russia. A blond dye applied to her dark hair was successful in baffling the police and she was able to meet and plan with fellow revolutionists in Moscow, Kiev and St. Petersburg itself. Her return was in May. On June 6 the emperor promised the speedy convocation of a national assembly, but when a month later, the new law was issued, it was found that once more the autocrat had perjured himself and that his promised "imperial duma" was to be no more than a consultative body. It could "examine" proposed legislation, but the duty and right of making laws still rested with the czar alone.

The announcement was met with that furious agitation which has passed into history as the most remarkable political phenomenon of modern times. A general strike, culminating in September, tied up all communication throughout the country. For days the whole mechanism of existence was at a standstill, and all intercourse with the outside world cut off. The Russian people, after centuries of oppression and years of intermittent, scattered revolt, had apparently united, caught the government unprepared and were about to wring from it a degree of toleration and justice which would make up for all the bloodshed and destruction it had cost.

What followed is general knowledge. Except for one act, Miss Sukloff's part in it was that of hundreds of other revolutionists. That act, which must remain nameless until Miss Sukloff's mission here permits her to disclose it, places her high up among those whom the Russian peasant and workingman are today bewailing as lost leaders and martyrs, those who went to the last desperate extreme to free their countrymen from tyranny, and whose efforts,

though still sources of inspiration, were robbed of the immediate victory which seemed so likely to crown them.

The paralyzing warfare of which this act was a part at last forced the government to yield. On October 30 the czar issued his famous manifesto, containing seven brief paragraphs in which was promised a constitution guaranteeing national representation, freedom of conscience and opinion, and individual liberty. For a moment it seemed to the leaders of revolt as if the French Revolution had been fought over again to a happier ending.

On January 1, 1906, Miss Sukloff was arrested and after seventeen days was tried and sentenced to imprisonment and hard labor for life. Out on the Mongolian frontier in Manchuria, 3,000 miles from the nearest point in European Russia, stands the stronghold of Akatui, a prison for murderers and thieves. Only the year before the government had begun to herd its political prisoners there also and it was to Akatui that Marie Sukloff was sent. Her arrival with five other heroines of the revolution was greeted by the political exiles who had preceded her with triumphant songs, with flowers and with banners bearing the inscription: "Through struggle you will get your rights."

Some Famous Rebels

In Akatui she found herself among a group of revolutionists known throughout all Europe. Among them was Gregory Gershuni whom many Americans will remember, for he came here following his escape in 1907, and whose words, hurled at the judges who tried him for assassination, are part of the message of the Revolution:

"History will forgive you everything—the centuries of oppression, the millions you have starved to death, the other millions you have sent to be butchered on the battle-field;—everything but this: that you have driven us who mean well with our fatherland to seek recourse in murder."

Gershuni set at naught the government which imprisoned him by escaping in a barrel of sauerkraut, only to die a year later of lung trouble. This version of Gershuni's escape has been denied, but when I asked Miss Sukloff if it was true, her answer was characteristic of her experience. "I was among those," she said, "who helped to nail the lid on and punch the breathing holes."

There were also Sidortchuk, student in an agricultural school, who killed the chief of police of Zhitomir during a Jewish pogrom, and later died by drowning in Italy; Karpowitch, the student who killed Bogolepoff, minister of education, and later escaped from Akatui to London. Another was Soson-

off, the slayer of Plehve, for "God knows which of his blood-lettings." When an order was issued that a number of political prisoners be whipped, ten of Miss Sukloff's companions tried to commit suicide and Sosonoff, who had taken poison, was the only one who succeeded.

Five of those at Akatui besides Marie Sukloff were women. There was the teacher, Bitzenko, who had killed General Sakharoff after his descent upon a village with a so-called punitive expedition (she is still in Akatui); Izmailovitch, daughter of a lieutenant general in the Manchurian army, who after the Jewish massacre in Minsk helped a man throw a bomb at General Kurloff, wounding him and killing the chief of police (also still in Akatui); Yeserskaja, daughter of a noble family and wife of the president of a provincial assembly, who killed Governor General Klingenberg following the pogrom at Mohilov (she has since been transferred to Yakutsk); Fialka, a working girl of nineteen, who was caught in charge of an Odessa laboratory where bombs are made (she is now in Bagousin, Siberia); and Spiridonova, one of the best known of all, for it was this young school teacher who shot down Lujenofsky for his massacring of the peasants in the district of Tomboff. After the shooting Spiridonova was beaten and flogged by the soldiers. They mutilated one of her eyes. Two officers bragged of raping her. These paid for it in death at the hands of her friends. She, too, is still in Akatui. She said to her judges:

"I am going away from this life. You may kill me, you may contrive the most horrible punishments, but you cannot add anything to what I have already endured. I am not afraid of death. Put me to death—but you cannot kill in me my faith in the fact that there will come a time when our nation will be happy, when our nation will be free, when the life of our nation will assume forms in which truth and justice will be realized, when the ideals of brotherhood and liberty will not be merely empty sounds. For this I do not regret to give my life! That is all."

Punishment by Idleness

To see Miss Sukloff today makes one feel that a life of hard labor in prison would soon kill her. But the "hard labor" which the czar plans for his political prisoners wears out their minds, not their bodies. "Our work," says Miss Sukloff, "consisted of doing nothing. About fifteen years ago the government discovered that political prisoners were quiet and philosophical while doing hard labor, so it decided that that was too easy a punishment. Much worse, it was thought, would be just having to sit with folded hands and folded brains for weeks, months, years. And it is worse. That

is why so many try to commit suicide at every chance. They are driven crazy by idleness."

Miss Sukloff's description of the life at Akatui was published in *THE SURVEY* for January 3. During the winter a New York newspaper printed a dispatch from St. Petersburg declaring that Russia had decided on far-reaching reforms in her prison system. Solitary confinement and idleness were to be done away with, the story said, and Siberia would soon be known as a blossoming garden, not a dungeon. I showed this to Miss Sukloff and she laughed. "I have heard stories like this many times," she said. "But they are never true. Nothing ever happens." She has no faith in the reform of Russian prisons except as it may come through bitter compulsion.

For over four and a half years, while the fruits of the revolution were drying up, she endured this prison life on the Mongolian frontier. One day it was discovered that she had appendicitis and a trip to Irkutsk for an operation was decided upon. She was glad—any break in the monotony was welcome. But there followed eight months of monotonous waiting in the Irkutsk prison before the operation was performed.

The Second Escape

Her jailers found that it is as necessary to guard sick people as well ones. The operation left her in a weakened condition—but not too weak to think. A bare fortnight after it was performed her cot was empty and she was not to be found. How she did it she has not yet told. There is a rumor that she crept between the legs of a sleeping sentry and hid in a nearby town while it was ransacked by government officials. Those who know the story say that her escape was more dramatic and hair-breadth than any that have yet been written.

With this second escape, in April, 1911, the story of Marie Sukloff as an active revolutionist ends. To the blunt question, What made you a revolutionist? she has but one answer—a shrug of the shoulders indicating the futility of all reply. "I would have to speak that much to tell you," she said, picking up a large volume from the table. "I would have to tell you all that is wrong in Russia." It was a sufficient answer, in that it disclosed that no single act of oppression, such as the sacking of her home town or the murder of a close friend, had led her to take up arms against her government. She is the product of accumulated tyrannies, she was ground out by the slow processes of education and experience.

"Yet," she said, "I have often wondered why I am the only revolutionist in my family. When I was stealing inflammatory pamphlets and eavesdrop-

ping on secret meetings, my brother, three years older than myself, was living in the same town and subject to the same influences. But he was not serious minded, and when he was old enough to enter the army, he ran away to Canada to avoid compulsory service. Even my chum who ran away to night meetings with me, married, became the mother of children, and settled down to a bourgeois life."

The disintegration of the revolution during the years of her imprisonment are well known. How, after the alluring promises of the czar's manifesto, the "terrorists of the reaction" began an organized extermination of the elements supposed to be hostile to the traditional régime; how the "black hundreds," as they were branded by public opinion, directed their attacks especially against the Jews until robbery and murder, committed with the connivance of the police, became wholesale; how the first duma, in the spring of 1906, made so many further demands on the throne that it was speedily dissolved, its most radical element adjourning to Finland and there meeting in imitation of the tennis-court conference at Versailles; how the policy of influencing elections was begun before the second duma, a year later, and carried to such a flagrant extreme before the third duma that the minister of the interior had to defend this breaking of the czar's sacred promise by declaring that what the autocrat had given the autocrat could take away; how freedom of conscience affecting 15,000,000 people and including the right of Christians to join non-Christian religions, was first granted and then, by the action of the administration, rendered a dead letter—all this has been written into history.

Miss Sukloff's Hopes

But though the revolution is dead, the revolutionists are not. Of their activities today and their plans for the future Miss Sukloff will not speak. It is their accomplishments of which they tell, for the past is secure; some one might rob them of their designs. The stones of oppression are grinding out new recruits to the forces of discontent. New leaders are coming forward. Miss Sukloff speaks joyfully of the formation, a few months ago, of the Peasants' Party, which with the Social Democratic Party and the Labor Party makes three revolutionary bodies now working secretly for the common cause. The leaders of these parties cannot let themselves become known, for to befriend the oppressed in Russia is to be an enemy to the government. It is different with those whose influence is wielded only by their writings. Of Russia's literary people, Korolenko, says Miss Sukloff, with his stories of the soil

and peasant life, is making the deepest impress on the oppressed working classes today.

Many ask how long it will be before a revolution of the peasants and working-men will be successful. Some one has put the time at twenty-five years. "I cannot tell," says Miss Sukloff. "In prison one gets out of touch with life.

Soon I may know again what to think of my countrymen, but now I cannot tell.

"But I wish that American women, who have so much of opportunity and freedom, could let their sympathy be known to their Russian sisters, who have nothing. It is hard for you in this glorious country to realize our condi-

tions and our struggles, our sacrifices and enslavement. Never was a conflict so unequal. I want to do what little I can to make you see what that conflict means. That is my mission in America—to help you feel the struggles of the Russian peasant as he tries to throw from his shoulders the weight of centuries."

Philanthropy and Business¹

By Edward T. Devine

LET us use the word *philanthropy* in the old and noble sense as brotherhood touched with emotion; as the love of fellow man not for what one can get out of him, or as a channel for ostentatious benevolence, but for his own sake, as a fellow being whom not to love and cherish and respect is to deny our birthright of humanity.

Not every man is by nature a philanthropist, any more than every man is normal and complete as to any other human trait; but the perfect man, the natural man, in the sense of that nature towards which the generations yearn and strive, is a philanthropist. He does care for others. He respects their rights not by contract, express or implied, but because it is his nature. He struggles for their advantage, not with conscious deliberation in order to promote his own, but again because it is his nature. He avoids injustice, oppression and fraud, not because the laws restrain him, but because they are detestable. He cannot help it. He is born that way; and social nurture does but strengthen his innate inclinations. Whatever his superficial demeanor may happen to be, he is not callous at heart, or coldly calculating in his fundamental human relations. He is moved by social ideals of a progress in which all men share; by visions of a redeemed society in which exertion, toil, even pain and suffering may indeed persist, but if so, not as a result of business relations, not as a result of man's injustice or neglect.

That, if your minds go along with me so far, is what we are to understand by philanthropy, a glowing faith in humanity, a manner of life which is based upon constant recognition and acceptance of a family relationship to other men. It is inconsistent with deliberate incitement to class conflict, though it is not without a sympathetic understanding of that class conscious struggle which is, or may be, an inter-

mediate stage towards universal brotherhood.

Business—perhaps because it is more familiar—is a little harder to define. It is evidently not to be identified with philanthropy. Business men are constantly telling us that they are not engaged in philanthropic enterprises, a curious variant of this announcement being that they are not in business for their health, as if the preservation of their precious health were the highest form of philanthropy of which they could conceive, or at least the farthest removed from their ordinary pre-occupation with business. Even social welfare features tacked on to industrial or mercantile establishments are often zealously guarded against what the proprietors are pleased to call the "taint" of philanthropy.

Business Not Altruistic

No! business is not philanthropy. They are not of one blood. In fact there is a temptation to take the short cut of describing business as simply the opposite pole to philanthropy, its direct negation in principle and its chief obstacle in practical experience. We all recognize that commerce may be a means of strengthening human relations; that industry may represent the organized effort of society to meet human wants; and that both commerce and industry so understood are beneficent. Business then might be represented as that particular principle in commerce and in industry which antagonizes their unifying and beneficent results; as the exploitation of employees, competitors and consumers for personal gain. Pure business might be described as the unadulterated effort to secure from every transaction the utmost pecuniary advantage.

If business were so defined, the business man would be one who deals with affairs, that is to say with the making, transporting and marketing of goods solely from the standpoint of personal profit, and it would be a matter of sublime indifference to him, as a business man, whether profit were obtained by the cheapening of machinery and pro-

cesses, by lowering the wages of labor, by widening the market, by eliminating competition and raising prices, by monopolizing incidental unearned increment, by side speculations in securities, or by securing governmental favors. The temptation to give the business man this bad name and hang him at once is greatly strengthened by the unfortunate fact that business has done all these things and does them. Business in the abstract and business practice in the concrete deserve the hard things which have been said of them by the prophets of Israel, by the Greek philosophers, by the oriental seers, by the Christian fathers, by the poets of humanity, and by the candid critics of this latter age in which successive industrial revolutions have enthroned business in substantial control of our destinies, so that as never before in human history, we may observe the real nature of business written large upon the face of human affairs.

But in such a characterization of business as this there would be injustice—an injustice like that of the Scotch-Canadian philosopher who wrote a book on the American woman. He depicted a very disagreeable creature. Somewhere in his volume, he explained that this type of woman was not distinctively American. It seems that she is to be found also in Canada and in Scotland, but for convenience he preferred to call her an American woman because he had to have a title, and it seemed to pain the author less to picture the object of his dislike and disapproval as an American. That there might be some sensitiveness on the part of the real American woman appears not to have troubled his philosophic soul.

The prevailing mood among students of the social aspects of business is really one of perplexity. There are those who love business, just as Emerson liked a monk's cowl, or as ex-President Taft loves the courts. Puritan as he was, Emerson balked when it came to realities and could not imagine himself cowed. Professor Taft, himself, is said to use strong language, especially in

¹An Address given before the National Conference of Charities and Correction at Memphis, May 10, 1914.

private conversation, about the doings of particular judges in these same courts which on principle he loves. Any socially minded business man has a hard time to defend business at its worst as we now all know it to be since the Hughes insurance investigation, and the collapse of the New Haven system, and all the sickening exposures in the decade between those two events have done their deadly work. Business includes all that is done primarily for profit, and the fact is that an infinite number of wholly useful and praiseworthy things are actually done from that motive. Whether commerce and industry could be carried on, as Socialists think that they could, if the motive of personal profit were eliminated, is a fair question for debate, but certainly they are carried on from that motive mainly at present, and to business we must give the credit for the greater part of what they achieve.

Business Men Not Limited to the Business Motive

As we survey the history of industry and commerce, of business in operation, we discern unquestionably much that seems to express the spirit of philanthropy, that seems to prophesy a day when other motives will drive out or dominate the business motive, when considerations of social welfare rather than the extortion of profit will become a direct and all pervading motive. Business men sometimes ascribe all these beneficent changes to the enlightened application of business principles. Enlightened selfishness is proposed as a sufficient guide to action even in matters vitally affecting others. Philanthropy is dismissed sneeringly either as an utter delusion and pretense, or as a negligible means, among many, of personal gratification, in other words a form of selfishness. I contend, on the contrary, that business is not entitled to this degree of credit, that it is only as the business motive is limited, restrained, supplemented or replaced by other motives that there is substantial progress in bringing commerce and industry, and other social activities into conformity with genuine social needs.

Fortunately the business man is seldom a business man simply. He is a leader of men with an instinctive fondness for accomplishing some good results from his leadership. He is an inventor with a pride in his inventions. He is a religious man with reverence for religious traditions and sanctions. He is a professional man with respect for professional standards. He is a consumer of liberalizing forms of culture. He is a citizen with political and civic instincts. He is a philanthropist with the welfare of his neighbors, his employees, his competitors and his customers at least intermittently in mind. He has generous impulses and just desires.

He circumscribes his business activities and prefers to be partially, at least, a man. He installs welfare schemes, shamefacedly telling the world that he is doing it for business reasons, that contented employees are a good investment, but really feeling a glow of satisfaction, not only at the higher dividends but at the contentment.

Nevertheless, welfare work, coming into existence in such ways is certain to be fragmentary, erratic and disappointing. Business mitigated by philanthropy is better than business unalloyed, but it is no adequate safeguard for human interests. A deeper change than any that has yet been made voluntarily by business itself is essential. Industrial democracy in the spirit of philanthropy is essential; by which we mean the actual participation—not by sufferance but by established custom—the sustained and effective participation of industrial workers in determining the conditions of their work; hours and wages, the conditions of employment and discharge, the introduction of new processes, the way in which one part of the work is to be adjusted to another, the administration of relief and aid schemes, of retiring pensions, and other features of what makes up the total compensation of the workman. Some kind of joint responsibility should be established for maintaining standards of quality of work, so that consumers will have a guarantee based not merely upon the business interests of proprietors, but also upon a long tradition and pride of workmanship in those who are actually doing the work. Obviously this is a different ideal from that of our friends, the efficiency engineers, relying less upon management and discipline; tests and measurements; more upon individual initiative and *esprit de corps*; upon personal capacity and good will.

The ideal of philanthropy is human. It does not become enthusiastic over such conservation of workers as is directed towards the increase of profits. It does not rave over high wages which are paid in order to secure a low labor cost. It believes in conservation and in high wages for other reasons. Nor does it interpret as in the interests of business the current movement for the conservation of life and health, the various movements for reducing the death rate, for safeguarding the public health, controlling infection, improving the racial stock, raising the standard of living, protecting women and children, reducing hours of labor and promoting rational recreation in the hours of leisure. No doubt their net effect is to restrict rather than to enlarge the field of exploitation. The content of life itself is the thing about which philanthropy is concerned. Workers are not looked upon as assets of business, but the ultimate consumers of the products of industry. There is to be no such nationalization of labor as

Mr. Walling in his interesting Progressivism and After forecasts. To workingmen as philanthropists, under the full sway of the spirit of brotherhood, the monstrous perversion implied in looking upon his fellow workman as a machine, rather than as a rational user and producer of wealth, will be sufficiently apparent.

The question which was in the mind of the chairman in assigning this topic is I hope partly answered. To what extent, you asked in the Bulletin, are the captains of industry heeding the pleading of the humanitarians in preventing misery and promoting the common good?

Business has become more humane and more human. This is partly because business men have shared in new social ideals and have learned from the general trend of human events. It is partly because of external pressure. It is not primarily from enlightened or unenlightened selfishness. It has not been for the sake or with the result of increased profits.

Enlightened Selfishness Not Enough

You asked further: Will the time soon come when business will stand out in the open, not merely with an assenting lisp, but rather with a championing shout, declaring that in the last analysis the human factor must never be submerged under the commercial and industrial.

I hear that shout but it is in the language of civics and philanthropy and not in the dialect heard upon the Rialto. Looking to the future we may expect more from the development of the social spirit in the community as a whole, from the strengthening of the position of workers as such, and of consumers as such than from any clearer perception of the directions in which business interest, in the sense of larger profits, are to be sought.

There is no prospect that business will usurp the functions of philanthropy. There is no promise in any achievements of business unrestrained by law or external opinion which would warrant our abdicating as agitators of public opinion. There is no safety in leaving business to manage its own affairs, that is to say, our affairs looked at from the aspect of the pecuniary advantage of the business manager of them. On the contrary, the one constant factor in all social problems which is most baffling, most dangerous, and most worthy of our constant consideration is precisely the business interest which will suffer from its being solved.

The socializing of religion, of philanthropy, of medicine, of education, of recreation, of government, is going on apace. The socializing of business lags far behind. There are initial experiments like that of the Provident Loan Society in pawnbroking which would seem to indicate that it is not impossible.

but there are as yet no evidences that we may cast aside our philanthropic ideals and trust to business for social salvation.

It was in the first half of the nineteenth century in England that business had its unique opportunity. The new science of political economy was its charter and apology. Free trade came at its bidding, *laissez faire* became its watchword, steam its magician. Everything then first conspired to give to business the chance which, in earlier ages, religion, philosophy, politics, and economic conditions had equally conspired to deny. The economic man of the classical economists was not so much of an abstraction, not so much a figment of the imagination as we often assume. He was the real Englishman of an epoch, acting on a business instinct in a golden age made possible by industrial changes. But it was a failure. Factory laws and sanitary regulations, whether inherently desirable—and so late a philosopher as Spencer thinks they are not—were an absolute necessity to rectify the horrible conditions, which the business régime brought into existence. Business was tried and found wanting. It did not sufficiently promote the ends of human life; it was at odds with philanthropy; it produced hatred and resentment and sullen anger; Chartism in one generation and Socialism in the next were its indictment, and whatever the value of the remedies which they proposed, as indictments they have never yet been quashed.

It is a far cry from the north of England a century ago to Mexico and Colorado in the spring of 1914, but the fruits of business, the bitter fruits of business when least restrained, when most itself, are here as they are there.

Mexico and Colorado

If unhappily intervention of the United States in Mexico should prove after all to be necessary—as I hope it will not be—it should be upon even broader grounds than those described in the defeated Lodge amendment. Not because the flag was insulted, not even because American lives and property had been destroyed, but in expiation and remorse because of the sad consequences of the fact that American business men, together with the business men of other civilized nations, controlling the industries of Mexico, have acted consistently upon so-called business principles, and so acting have created or perpetuated the conditions of illiteracy, peonage, landlessness, low standards of living and general helplessness which prevail in that distracted country. If the railways, mines, oil wells and plantations of Mexico, in which American investments are said to be far greater than Mexican investments, had been managed with a view to the social welfare of Mexicans, instead of with a view to their exploita-

tion for the profit of investors, we and the English, and the Germans, and the Canadians might have easier national consciences than we are now entitled to.

I am not advocating intervention. On this we may very well follow the evidently conservative intentions of the national administration. If, however, intervention takes place, it will have to be justified not by its causes but by its results; by the policies followed after intervention has become a fact. It is not surprising that a newspaper supposed to reflect financial interests took quick alarm when a neighboring journal suggested editorially that President Wilson's obvious sympathy with the constitutionalists under Carranza and Villa was probably prompted by his approval of the land policy which they have inherited from Madero, a land policy not to be distinguished from that of the noble Gracchi in Rome, that of the anti-patroom rioters in New York, that of Gladstone in Ireland, and that to which Lloyd George seems to be tending in England—a policy of moderate holdings by cultivators, instead of absentee ownership of vast estates cultivated by serfs.

The more salient issues in Colorado are really not obscure though the responsibility for particular acts of violence of course awaits investigation. What is clear is that the corporations engaged in the steel mills and the mines have overworked their employes, as their competitors elsewhere have overworked theirs, that the twelve hour day and the seven day week have been prevalent there as they have been prevalent in Alabama and Pennsylvania, that exploitable immigrant labor has been utilized because it was cheap and because it was exploitable; that unionism has been bitterly and persistently fought by the companies. Without organization on their part there can of course be no effective collective bargaining, no industrial democracy. There are excellent welfare features in these industries especially in the steel plants of the Colorado Fuel and Iron Company. The wages are said to be as high as among their competitors, but the overworked miner and mill worker without a union is not and cannot be an industrial citizen; even politically he is scarcely a citizen. He is in no position to co-operate in securing political or industrial justice. Deprived of the instruments of national progress he resorts to the cruder and now happily unlawful weapons of earlier stages of civilization. Business, crude, unsocialized business has created him. Business must accept responsibility for his acts; and the business men who have actually shaped the business policies on the ground could not if they would evade their own share of that responsibility. The independent companies in accepting freely their share as they have done in a recent statement, declaring that this is not a Rockefeller war, have

shown, I think, a better sense of proportion, a sounder spirit of fair judgment, than have the irresponsible organizers of the Free Silence Demonstration. The miner and mill worker have their own individual responsibility of course. No fear that society will not enforce it to the utmost.

But here we are seeking the deeper truth of a social responsibility, which will never be tried in the courts but only in the enlightened conscience of mankind. Of this social responsibility the business investor, the Rockefellers and others, must bear the chief burden.

Business then is the management of affairs for profit. Exploitation is a word which has implications which many of us dislike, but there is no more accurate phrase that I can find to express what business is than to say that it is the exploitation of competitors, employes and consumers for personal gain. The activities put forth from this motive have been largely beneficent but it is equally true that they have often been disastrous.

Social control of business therefore is essential through direct government regulation—which must not become destruction—through taxation, through legislation to protect the weak, and through administrative machinery to facilitate the course of industrial justice, machinery for the settlement of industrial disputes, for the investigation of grievances, for the maintenance of uniform standards of protection.

If the government is to exercise this control and create this administrative machinery, obviously government must be stronger than business, must command the services in the interests of the social welfare of the ablest men; and if government itself enters into business enterprises and business relations, it must set a high standard of fairness as well as efficiency in all its dealings with competitors, employes and the public. When the liquor business is regarded chiefly as a source of revenue, when railways are exploited as a means of keeping down a post office deficit, questions arise as to whether the necessity for such lofty standards is realized.

The appeal to justice is good but it is not enough. Not theology only but social economy makes Portia's confession that in the course of justice none of us should see salvation. The total annihilation of injustice might leave us bankrupt of progress, prosperity, and good will. The appeal of the future as of all the past is for a genuine philanthropy of which justice is a part, for a passionate concern that our neighbor shall have from us not just dealing only, but the electric touch of human sympathy and understanding, the partnership of man with man which keeps us above the brutes and below the gods on the more congenial levels of our common humanity.

Poems by Morris Rosenfeld

IN THE FACTORY

OH, here in the shop the machines roar so wildly,
That oft, unaware that I am, or have been,
I sink and am lost in the terrible tumult;
And void is my soul—I am but a machine.
I work, and I work, and I work, never ceasing,
Create and create things from morning till e'en;
For what? and for whom? Oh, I know not! Oh, ask not!
Whoever has heard of a conscious machine?

No; here is no feeling, no thought and no reason;
This life-crushing labor has ever supprest
The noblest and finest, the truest and richest,
The deepest, the highest and humanly best.
The seconds, the minutes, they pass out forever,
They vanish, swift fleeting like straws in a gale.
I drive the wheel madly as tho' to o'ertake them,
Give chase without wisdom, or wit, or avail.

The clock in the workshop, it rests not a moment;
It points on, and ticks on; Eternity, Time:
And once someone told me the clock had a meaning,
Its pointing and ticking had reason and rhyme.
And this too he told me, or had I been dreaming,
The clock wakened life in one, forces unseen,
And something besides—I forget what; Oh, ask not!
I know not, I know not, I am a machine.

At times, when I listen, I hear the clock plainly;
The reason of old—the old meaning—is gone!
The maddening pendulum urges me forward
To labor and labor and still labor on.
The tick of the clock is the Boss in his anger!
The face of the clock has the eyes of a foe;
The clock—Oh, I shudder, Dost hear how it drives me?
It calls me, "Machine!" and it cries to me, "Sew!"

At noon, when about me the wild tumult ceases,
And gone is the master, and I sit apart,
And dawn in my brain is beginning to glimmer,
The wound comes agape at the core of my heart;
And tears, bitter tears flow; ay, tears that are scalding;
They moisten my dinner, my dry crust of bread;
They choke me, I cannot eat; no, no, I cannot!
Oh, horrible toil! born of Need and of Dread.

The sweatshop at mid-day—I'll draw you the picture:
A battlefield bloody; the conflict at rest;
Around and about me the corpses are lying;
The blood cries aloud from the earth's gory breast.
A moment—and hark! The loud signal is sounded,
The dead rise again and renewed is the fight.
They struggle, these corpses; for strangers, for strangers!
They struggle, they fall, and they sink into night.

Und lehr' — doch was? — Ich hab' es vergessen.
O frag' nicht. — Ich bin nur Maschine. — nichts mehr.

Es ritt und schlägt, es kreisen die Seiger. . .
Doch horch — was kringt dort her von der Wand?
„Rege Dich!“, ruft der ruhlose Pendel, *sa sa*
„Rascher, rascher rühre die Hand!“ *sa sa*
Die Seiger gleichen zwei bösen Augen, *sa sa*
Die lauern auf mich hinuntersehn, *sa sa*
Und jeder Schlag ist wie Meisters Schellen:
„Maschine“, schreit es, „Du hast zu nahn!“ —

Nur dann, wenn langsam verraucht das Getümmel
Und der Meister fort ist, — zur Mittagszeit, —
Da kommt wieder Klarheit in meine Sinne,
Ich fühl' meine Wunden, es regt sich mein Leib,
Und bittere Thränen und heiße Thränen *sa sa*
Benetzen mein mageres Mittagsbrot. — *sa sa*
Es würgt mich, ich kann nicht mehr essen, ich kann nicht!
O schreckliche Arbeit! Entsetzliche Noth! *sa sa*

Es scheint mir die Werkstatt zur Mittagsstunde
Ein Schlachtfeld, auf dem das Kämpfen ruht:
Ringsum im Kreise, da liegen viel Tote, *sa sa*
Es schreit von der Erde zum Himmel ihr Blut.
Ein Weibchen — dann lauter die Glocke zum Sturme,
Die Töten erwachen: anhebt die Schlacht, *sa sa*
Es kämpfen die Körper für Fremde, für Fremde,
Und streiten und fallen und sinken in Nacht.

Ich blick' auf den Kampfplatz mit bitterem Jorne,
Mit Schreck und mit Haß und mit höllischer Pein,
Die Uhr — jetzt oerfieh' ich sie richtig — sie weckt mich:
„Genug schon der Knechtschaft! Ein Ende muß sein!“
Sie weckt meine Sinne und reizt die Gedanken
Und zeigt mir, wie ellenbs die Stunden entfliehn:
Ein Elender bin ich, solange ich schweige *sa sa*
Verloren, solange ich bleib', was ich bin. *sa sa*

Der Mensch, der in mir geschlafen, erwacht jetzt,
Der Knecht, der in mir gewacht hat, schläft ein.
Jetzt ist die richtige Stunde gekommen! *sa sa*
Genug schon des Elends! Ein Ende muß sein! . . .
Du plötzlich — ein Pfiff — der Meister — ein Ärmern —
Die Schlacht hebt an — es wogt um mich her —
Der Taumel verflüchtigt mich — ich weiß nichts —
mich schert nichts —
Ich bin nur Maschine, Maschine. — nichts mehr. . .

I gaze on the battle in bitterest anger,
And pain, hellish pain wakes the rebel in me!
The clock—now I hear it aright! It is crying:
“An end to this bondage! An end must there be!”
It quickens my reason, each feeling within me;
It shows me how precious the moments that fly.
Oh, worthless my life if I longer am silent,
And lost to the world if in silence I die.

The man in me sleeping begins to awaken;
The thing that was slave into slumber has passed:
Now! Up with the man in me! Up and be doing!
No misery more! Here is freedom at last!
When sudden: a whistle!—the Boss—an alarm!
I sink in the slime of the stagnant routine;—
There's tumult, they struggle, oh, lost is my ego;
I know not, I care not, I am a machine!

THE CANDLE SELLER

IN Hester Street, hard by a telegraph post,
There sits a poor woman as wan as a ghost.
Her pale face is shrunk, like the face of the dead,
And yet you can tell that her cheeks once were red.
But love, ease and friendship and glory, I ween,
May hardly the cause of their fading have been.
Poor soul, she wept so, she scarcely can see.
A skeleton infant she holds on her knee.
It tugs at her breast, and it whimpers and sleeps,
But soon at her cry it awakens and weeps—
“Two cents, my good woman, three candles will buy,
As bright as their flame be my star in the sky!”

Tho' few are her wares, and her basket is small,
She earns her own living by these, when at all.
She's there with her baby in wind and in rain,
In frost and in snow-fall, in weakness and pain.
She trades and she trades, through the good times and slack—
No home and no food, and no cloak to her back.
She's kithless and kinless—one friend at the most,
And that one is silent: the telegraph post!
She asks for no alms, the poor Jewess, but still,
Altho' she is wretched, forsaken and ill,
She cries Sabbath candles to those that come nigh,
And all that she pleads is, that people will buy.

To honor the sweet, holy Sabbath, each one
With joy in his heart to the market has gone.
To shops and to pushcarts they hurriedly fare;
But who for the poor, wretched woman will care?
A few of her candles you think they will take?
They seek the meat patties, the fish and the cake.
She holds forth a hand with the pitiful cry:
“Two cents, my good women, three candles will buy!”
But no one has listened, and no one has heard:
Her voice is so weak, that it fails at each word.
Perchance the poor mite in her lap understood,
She hears mother's crying—but where is the good?

I pray you, how long will she sit there and cry
Her candles so feebly to all that pass by?
How long will it be, do you think, ere her breath
Gives out in the horrible struggle with Death?
How long will this frail one in mother-love strong,
Give suck to the babe at her breast? Oh, how long?
The child mother's tears used to swallow before,
But mother's eyes, nowadays, shed them no more.
Oh, dry are the eyes now, and empty the brain,
The heart well-nigh broken, the breath drawn with pain.
Yet ever, tho' faintly, she calls out anew:
“Oh, buy but two candles, good women, but two!”

In Hester Street stands on the pavement of stone
 A small, orphaned basket, forsaken, alone.
 Beside it is sitting a corpse, cold and stark:
 The seller of candles—will nobody mark?
 No, none of the passers have noticed her yet.
 The rich ones, on feasting are busily set,
 And such as are pious, you well may believe,
 Have no time to spare on the gay Sabbath eve.
 So no one has noticed and no one has seen.
 And now comes the nightfall, and with it, serene,
 The Princess, the Sabbath, from Heaven descends,
 And all the gay throng to the synagogue wends.

IN THE WILDERNESS

ALONE in desert dreary,
 A bird with folded wings
 Beholds the waste about her,
 And sweetly, sweetly sings.

So heaven-sweet her singing,
 So clear the bird notes flow:
 'Twould seem the rocks must waken,
 The desert vibrant grow.

Dead rocks and silent mountains
 Wouldst waken with thy strain;
 But dumb are still the mountains,
 And dead the rocks remain.

For whom, O, heavenly singer,
 Thy song so clear and free?
 Who hears or sees or heeds thee,
 Who feels or cares for thee?

Thou may'st outpour in music
 Thy very soul. 'Twere vain!
 In stone thou canst not waken
 A throb of joy or pain.

Thy song shall soon be silenced.
 I feel it—For I know
 Thy heart is near to bursting
 With loneliness and woe.

Ah, vain is thine endeavor;
 It naught availeth—nay,
 For lonely as thou camest,
 So shalt thou pass away.

A MILLIONAIRE

NO, not from tuning-forks of gold,
 Take I my key for singing.
 From Upper Seats no order bold
 Can set my music ringing.
 But groans the slave through sense
 of wrong,
 And naught my voice can smother;
 As flame leaps up, so leaps my song
 For my oppressed brother.

—And thus the end comes swift
 and sure,
 Thus life itself must leave me;
 For what can these my brothers poor
 In compensation give me,
 Save tears for ev'ry tear and sigh?
 For they are rich in anguish.
 A millionaire of tears am I,
 And mid my millions languish.

O, synagogue lights, be ye witnesses bold
 That mother and child died of hunger and cold:
 Where millions are squandered in idle display
 That men, all unheeded, must starve by the way.
 Then hold back your flame, blessed lights, hold
 it fast!

The great day of judgment will come at the last.
 Before the white throne, where imposture is vain,
 Ye lights for the soul, ye'll be lighted again!
 And upward your flame there shall mount as on
 wings,
 And damn the existing false order of things!

LIBERTY

WHEN night and silence deep
 Hold all the world in sleep,
 As tho' Death claimed the Hour,
 By some strange witchery
 Appears her form to me,
 As tho' Magic were her dow'r.

Her beauty heaven's light;
 Her bosom snowy white;
 But pale her cheek appears.
 Her shoulders firm and fair;
 A mass of gold her hair;
 Her eyes—the home of tears.

She looks at me nor speaks.
 Her arms are raised; she seeks
 Her fettered hands to show.
 On both white wrists a chain!
 She cries and pleads in pain:
 "Unbind me!—Let me go!"

I burn with bitter ire,
 I leap in wild desire
 The cruel bonds to break;
 But, God! around the chain
 Is coiled and coiled again
 A long and loathsome snake.

I shout, I cry, I chide;
 My voice goes far and wide,
 A ringing call to men:
 "Oh, come, let in the light!
 Arise! Ye have the might!
 Set Freedom free again!"

They sleep! But I strive on.
 They sleep! Can't wake
 a stone?
 That one might stir! but one!
 Call I, or hold my peace,
 None comes to her release;
 And hope for her is none.

But who may see her plight
 And not go mad outright!
 "Now, up! For Freedom's sake!"
 I spring to take her part:
 "Fool!" cries a voice. I start.
 In anguish I awake.

Within, where they pray, all is cleanly and bright,
 The cantor sings sweetly, they list with delight.
 But why in a dream stands the tall chandelier,
 As dim as the candles that gleam round a bier?
 The candles belonged to the woman, you know,
 Who died in the street but a short time ago.
 The rich and the pious have brought them tonight,
 For mother and child they have set them alight.
 The rich and the pious their duty have done:
 Her tapers are lighted who died all alone.
 The rich and the pious are nobly behaved:
 A body—what matters? But souls must be saved!

PEN AND SHEARS

MY tailor's shears I scorned then:
 I strove for something higher:
 To edit news—live by the pen—
 The pen that shall not tire!

The pen, that was my humble slave,
 Has now enslaved its master;
 And fast as flows its Midas-wave,
 My rebel tears flow faster.

The world I clad once, tailor-hired,
 Whilst I in tatters quaked,
 Today, you see me well attired
 Who lets the world go naked.

What human soul, howe'er oppressed,
 Can feel my chained soul's yearning!
 A monster woe lies in my breast,
 In voiceless anguish burning.

Oh, swing ajar the shop door, do!
 I'll bear as ne'er I bore it.
 My blood! You sweatshop leeches,
 you!
 Now less I'll blame you for it.

I'll stitch as ne'er in former years!
 I'll drive the mad wheel faster!
 Slave will I be but to the shears.
 The pen shall know its master!

I'VE OFTEN LAUGHED

I've often laughed and oftener still have wept.
 A sighing always through my laughter crept.
 Tears were not far away—
 What is there to say?

I've spoken much and oftener held my tongue,
 For still the most was neither said nor sung.
 Could I but tell it so—
 What is there to know?

I've hated much and loved, oh, so much more!
 Fierce contrasts at my very heart strings tore.
 I tried to fight them—well—
 What is there to tell?

THE PALE OPERATOR

I But with my pen I could draw him,
With terror you'd look in his face;
For he, since the first day I saw him,
Has sat there and sewed in his place.

Years pass in procession unending,
And ever the pale one is seen,
As over his work he sits bending,
And fights with the soulless machine.

I feel, as I gaze at each feature,
Perspiring, and grimy and wan,
It is not the strength of the creature,—
The will only urges him on.

And ever the sweat-drops are flowing,
They fall o'er his thin cheek in streams,
They water the stuff he is sewing,
And soak themselves into the seams.

How long shall the wheel yet, I pray you,
Be chased by the pale artisan?
And what shall the ending be, say you?
Resolve the dark riddle who can!

I know that it cannot be reckoned,—
But one thing the future will show:
When this man has vanished, a second
Will sit in his place there and sew.

FROM DAWN TO DAWN

I BEND o'er the wheel at my sewing;
I'm spent; and I'm hungry for rest;
No curse on the master bestowing,
No hell-fires within me are glowing.
Tho' pain flares its fires in my breast.

I mar the new cloth with my weeping
And struggle to hold back the tears
A fever comes over me, sweeping
My veins; and all through me goes
[creeping]
A host of black terrors and fears.

The wounds of the old years ache newly,
The gloom of the shop hems me in;
But six o'clock signals come duly:
O, freedom seems mine again, truly,
Unhindered I haste from the din.

Now home again, ailing and shaking,
With tears that are blinding my eyes,
With bones that are creaking and
[breaking.]

Unjoyful of rest—merely taking
A seat; hoping never to rise.

I gaze round me: none for a greeting!
By Life for the moment unpressed,
My poor wife lies sleeping—and beating
A lip-tune in dream false and fleeting,
My child mumbles close to her breast.

I look on them, weeping in sorrow,
And think: "When the Reaper has come—
When finds me no longer the morrow
What aid then? From whom will they
[borrow]

The crust of dry bread and the home?"

"What harbors that morrow," I wonder,
"For them when the breadwinner's gone?
When sudden and swift as the thunder
The bread-bond is broken asunder,
And friend in the world there is none?"

A numbness my brain is o'ertaking
To sleep for a moment I drop:
Then start! In the east light is
[breaking!]

I drag myself, ailing and aching,
Again to the gloom of the shop.

A TREE IN THE GHETTO

THERE stands in the leafless Ghetto
One spare-leaved, ancient tree;
Above the Ghetto noises
It moans eternally.

In wonderment it muses,
And murmurs with a sigh:
"Alas! how God-forsaken
And desolate am I!"

"Alas, the stony alleys,
And noises loud and bold!
Where are ye, birds of summer?
Where are ye, woods of old?"

"And where, ye breezes balmy
That wandered vagrant here?
And where, oh, sweep of heavens
So deep and blue and clear?"

"Where are ye, mighty giants?
Ye come not riding by
Upon your fiery horses,
A-whistling merrily.

"Of other days my dreaming,
Of other days, ah, me!
When sturdy hero-races
Lived wild and glad and free!"

"The old sun shone, how brightly!
The old lark sang, what song!
O'er earth Desire and Gladness
Reigned happily and long.

"But see! what are these ant-hills?
These ants that creep and crawl?
Bereft of man and nature,
My life is stripped of all!"

"And I, an ancient orphan,
What do I here alone?
My friends have all departed,
My youth and glory gone.

"Oh, tear me, root and branches!
No longer let me be
A living head-stone, brooding
O'er the grave of liberty."

THE PALE OPERATOR

FOR HIRE

WORK with might
and main,
Or with hand and heart,
Work with soul and brain,
Or with holy art,
Thread, or genius' fire—
Make a vest, or verse—
If 'tis done for hire,
It is done the worse.

WHITHER?

To a Young Girl

SAY whither, whither, pretty one?
The hour is young at present!
How hushed is all the world around!
Ere dawn the streets hold not a sound.
O, whither, whither do you run?
Sleep at this hour is pleasant.
The flowers are dreaming, dewy-wet;
The bird-nests they are silent yet.
Where to, before the rising sun
The world her light is giving?
"To earn a living."

O, whither, whither, pretty child,
So late at night a-strolling?
Alone, with darkness round you curled?
All rests! and sleeping is the world.
Where drives you now the wind so wild?
The midnight bells are tolling!
Day hath not warmed you with her light;
What aid can't hope then from the night
Night's deaf and blind! Oh whither, child
Light-minded fancies weaving?

"To earn a living."

CHANUKAH THOUGHTS

NOT always as you see us now,
Have we been used to weep and sigh,
We too have grasped the sword, I trow,
And seen astonished foemen fly!

We too have rushed into the fray,
For our belief the battle braved,
And through the spears have fought our
[way.]
And high the flag of vict'ry waved.

But generations go and come,
And suns arise and set in tears,
And we are weakened now and dumb,
Foregone the might of ancient years.

In exile where the wicked reign,
Our courage and our pride expired,
But e'en today each throbbing vein
With Asmonean blood is fired.

Tho' cruel hands with mighty flail
Have threshed us, yet we have not
blenched,
That fire is burning, still unquenched.

Our fall is great, our fall is real,
(You need but look on us to tell!)
Yet in us lives the old Ideal
Which all the nations shall not quell.

WIDOWS' FAMILIES

Pensioned and Otherwise¹

By William H. Matthews

DIRECTOR, DEPARTMENT OF FAMILY WELFARE, NEW YORK ASSOCIATION FOR IMPROVING THE CONDITION OF THE POOR

WE have not been engaged in relief work for these many years without learning that much is needed in the lives of our people other than mere material relief; that people do not always need what they most want, nor want what they most need. Yet we have also learned that, where the income of a family is below a certain point, the family must of necessity deteriorate by reason of insufficiency of food, lack of clothing, improper and unfit housing; that the lack of these elementary yet necessary things will of itself mean dwarfed, stunted, inefficient lives. Food, clothing and shelter are for the poor, as they are for the more prosperous, essential preliminaries to a humanized life, necessary for the mere maintenance of the functions of the body in normal state. Any adequate program of treatment of widows and their children must give assurance that at least this "indispensable minimum" shall be made possible to each and all alike.

We cannot reasonably hope for any upward trend in families we would help; we cannot hope for results by way of stronger, more resolute bodies and minds which shall in the children's later years mean a larger initiative, efficiency and productiveness, unless we remove from their lives today that constant crushing anxiety that not only deadens hope and aspiration in the mother's life, but also gradually lays its withering, paralyzing hand on the lives of the children, creating a downward pressure on life instead of an upward energy, sapping and undermining the vigor and hope of every member of the family.

Qualities of courage, faith, hope and thrift are not, generally speaking, bred and nurtured in families where continued poverty of life makes it impossible for them to look upon today as the threshold of a better tomorrow.

In some cases the weekly income of a family must of necessity be supplied entirely by the relief organization in charge; in others, the organization needs only to supplement the earnings of an older child, or in some instances, those of the mother herself; again, there may be friends or relatives able and willing to assist in part. Be that as it may, the plan made for the family must bring to

¹From a report just issued by the Association for Improving the Condition of the Poor, New York city.

I. The Indispensable Minimum

the mother the assurance of a definite weekly income, determined by an accurate analysis of the conditions and needs of the family and surely sufficient to supply the normal demands of family life. Any assistance given must be of sufficient amount so that the mother will not be required to work under conditions which mean the breaking of health and strength or the neglect of her children.

Idle it is to deny that a considerable number of people have become convinced that private relief has failed in its efforts to deal adequately with all families that find themselves threatened with or already suffering from such conditions of life, particularly in those homes where distress has crowded and crushed its way by reason of the sickness and death of the main breadwinner of the family. Evidence of such decision is seen in the various acts of legislation that have already been passed in many states, having for their purpose the alleviating and removing of such distress through funds to be gathered and administered by city, county, or state, as also in the appointment of commissions in other cities and states for the purpose of studying present conditions with a view of recommending like legislation.

The Pension Policy

As to the wisdom and justice of adequately caring for women and children who find themselves in or near poverty by reason of the death of the head of the family, we may assume there is no difference of opinion. For some years several of the better equipped private relief societies have been following that policy with at least a few of their families, increasing the number each year as their funds permitted. The New York Association for Improving the Condition of the Poor has been one of these. In records ten years old one may read of instances where regular weekly allowances were being made to mothers to the end that they and their children might remain together and that they might not feel the necessity of

working beyond their strength for the maintenance of their homes. Yet it was not until 1912 that the association entered upon this "pension policy" on any large scale.

We need not waste time here in discussing the correctness of the term. No vital distinction can be drawn between sums paid in this way and those paid in ordinary relief. Pensions differ in that they are expected to be adequate to meet all the necessities of family life, are paid regularly, are assured to the mother for a definite period of time, thus relieving her from worry and enabling her to adjust her expenses to her income. It is doubtful whether widows' pensions can be dissociated from the idea of relief. In fact, does any program having for its purpose the relief of the afflicted, the caring for the aged, the succoring of the widowed and fatherless, give any promise of such dissociation unless it be a comprehensive plan of social insurance to which all shall make contribution?

But the name is not so important as the method of administration, the spirit in which the pensions are given and received. It will always be a fair question as to whether it is relief itself or the methods by which it is administered that encourage dependency and create pauperism. There is always the danger that in our dread of making people dependent we shall cease to do good for fear of doing harm.

But there are in this city, as in others, thousands of men and women who have received and are now receiving years of education in preparatory schools, colleges and post-graduate schools by aid of scholarships and money grants. They are given these funds in the hope and belief that they will some day make return to the community in the way of useful, helpful lives. The assumption is that they will.

In precisely the same spirit should we supply in adequate measure an income to the families under discussion that shall give opportunity for education, health and all desirable development to these boys and girls until they at least arrive at working age, believing that such investment will be returned in the way of healthy, vigorous, red-blooded workers, that it is an insurance against under-vitalized, stunted, inefficient bodies, against breakage and wastage of future citizenship, against an increase

in that part of our juvenile population that ever keeps busy the machinery of juvenile courts, truancy schools, reformatories and other like institutions.

Administered in this spirit it will make little difference whether we call them "pensions," "mothers' allowances," "compensations to mothers," or by some other more pleasing name. Until the income needed for the maintenance and enforcement of a fair standard of life is assured there can be no foundation upon which the visitor from the relief organization, the nurse, the dietitian, can work.

With this hope and belief the New York Association for Improving the Condition of the Poor is adding to its

pension list each month as many widows' families as its funds make possible. 50 pensions have been granted since December, 1912.^{*} Of these, 7 have been discontinued, 3 by reason of the mother's remarriage, 3 because increase in age and earning ability of children made the family self-supporting; and 1 because of conclusive evidence of the mother's immorality. 43 families remain on the association's pension list. It must not be concluded that these constitute all of the widows' families receiving some definite allowance each week in the way of money or relief in kind. Of these we

will speak later. It does mean that in these 43 pensioned families, the association is supplementing or providing in full an income adequate to provide the necessities of life and to make possible a fairly high standard of home and child care, and that the work being done by the mother outside of her household duties is, neither in kind nor amount, endangering her health or causing her to neglect her children.³

As briefly as possible, and in so far as they lend themselves to statistical tabulation, let us set down some of the more salient facts pertaining to these 43 families and picture as accurately as we can the results achieved by this experiment.

II. The Pensioned Group

SEVEN nationalities are represented in the mothers of this group. Ireland was the birthplace of 14, the United States and Italy of 12 each, England of 2, Russia, Sweden and Switzerland, each, of one. With one exception, all have been residents of the United States for ten years or longer. In practically every instance residence has been in New York city. These facts, however, have not determined the granting of a pension.

The average age of these women at their husbands' death was 37 years, 3 months.

Eight mothers of this group spend part of their time at work outside their homes. We have deemed it wise for mothers to engage in work away from home only to a small extent, believing that the care of home and children called for their whole time and strength. The total hours of those who thus work are 172 per week and the total wages per week, \$30.50. The occupations are washing and cleaning in four cases; of the other four, one is an office attendant, one is in a millinery store, one is a waitress, and one helps at a milk station. In each of these instances proper provision has been made for watchful care of the children by relatives or friends while the mother is away.

It is sometimes said that these mothers should be expected to work where home demands are not urgent and where the age of the children is not such as to require considerable oversight, to which we are inclined to reply that it is the presence of children in the home that makes home demands urgent and that all children require oversight, irrespective of their age. In making decisions as to whether the mother might safely spend some time in gainful occupation away from home, we have striven to keep clearly in our mind as well as in the mother's, that her first duty lay in the proper rearing of her children.

By working at home 10 mothers are able to supplement their income. Three

do plain sewing, 3 wash, 2 finish clothing, one embroiders, and one is a milliner. Their total wages per week amount to \$33.75. Seven other women are janitresses, and receive free rent.

That economic breakdown comes in many of these families before widowhood, where the long sickness of the father has made necessary an appeal to relief-giving agencies, is a fact well known to social workers. In the case of these 43 families, 19 had received no charitable assistance so far as we could ascertain, previous to the time of widowhood; 9 had applied for assistance for a short period (6 months or less) before the husband's death, the loss of his wages through sickness having thrown the family below the level of self-support; the remaining 15 appear on our own records or those of other relief agencies as having sought assistance in previous emergencies ranging in periods from one to several years. In nearly all cases where the economic breakdown of the family had become serious before the death of the father, we find that tuberculosis was the sickness and the cause of death. Twenty-two of the 43 fathers died of tuberculosis.

Efforts to Restore Health

Most persistent and painstaking have been the efforts of visitors and nurses to restore the broken health of the mothers whose minds and bodies bore the traces of stress and strain during the protracted illness of the father. Prejudice of some of the women against public health agencies, lamentable failure at times to realize the need of continued hospital treatment,—these had to be patiently, kindly softened and overcome. Not all these mothers are today in good health. Educational nurses

^{*}Since this article was prepared, the A. I. C. P. has granted twelve more pensions.

must continue to visit many of the homes for some time yet. But trappings back and forth to dispensaries, clinics and hospitals are growing less, and treatment is being watched and followed by the association's nurses.

The opinions of doctors, nurses and visitors who have been responsible for the treatment of mothers in this group, show the health condition to be as follows:

General health good.....	25
Under attention of tuberculosis clinics.....	9
Bronchitis.....	1
Extreme nervousness.....	2
Ruptured.....	3
Obtusal rheumatism.....	3
Varicose veins.....	1

43

There are 191 children in all the 43 families, averaging 4.4 per family. The largest family has 8; the smallest, 2. Seventeen are boys over 14; 8 girls over 14. The others are under 14 years. Of the 17 boys over 14 years, 8 are at work at the following occupations and weekly wages:

Factory.....	\$7.00
Window dresser.....	6.00
Errand boy.....	6.00
Office boy.....	5.00
Errand boy.....	5.00
Messenger.....	4.50
Messenger.....	4.00
Lithographer's apprentice.....	3.00

Of the 8 girls over 14, 3 are at work: 1 in a factory at \$5 per week, 1 in an office at \$5 and the third as a clerk in a store at \$4 per week. The largest number of children working in 1 family is 2. In 33 of the families no children are at work. In several instances the pension plan has included the securing of a scholarship for some one of the children in the family. Much effort has been made to guide the children in their choice of an occupation that should give promise of a steady development of ability and consequent earning power.

It should be said also that our association is giving like care to several families other than those of widows, where the father is totally incapacitated for work by reason of illness (usually advanced tuberculosis) or insanity. These will not be discussed in this paper.

An examination of the school records of the children not at work shows regular attendance in each case.

Fifteen children are in institutions. Five are committed temporarily because of the mother's health; 5 are in hospitals for treatment of tuberculosis; 5 (boys) are in correctional institutions. As the waywardness of these 5 boys developed before the association made it possible for the mothers to remain at home, it is a fair question whether earlier action might not have prevented the necessity of commitment.

In emphasizing, as many relief societies do today, the fact that no children are now being committed to institutions by reason of poverty alone, we must be sure that the mothers of such children are not being required to toil beyond their strength to supply an income necessary to their family's maintenance; that the lives of mother and children are not being impoverished by the business of making a livelihood.

Medical Care

The health of the children in all but 4 of the 43 families needed medical and nursing attention when they came under our care.

Today the opinion of doctors and nurses is that in 26 of the 43 families the children are all in good health. In the other 17 families:

- 9 children must be closely watched and treated for possible development of tuberculosis.
- 4 are affected with slight heart trouble.
- 2 are suffering from infantile paralysis.
- 2 are afflicted with trachoma.
- 3 are crippled.
- 1 is mentally deficient.

From three of the families in which all of the children are now reported as in good health, children have, at our nurses' direction, spent periods at Otisville or at preventoria and are now at home well.

The combined total weekly income of the 43 families before the illness of the father was \$653.45, an average per family of \$15.19. The range of weekly wages of the men is shown in the following table:

Number earning \$8 to \$10 per week	5
" " \$10 " \$12 "	3
" " \$12 " \$14 "	10
" " \$14 " \$16 "	14
" " \$16 " \$18 "	1
" " \$18 per week or over	10
	43

These figures represent the men at full working capacity and not when illness had incapacitated them for regular work. It is well known that at such times the wife often supplements the income by going out to work. But even such combined effort often fails to keep the family income to the point attained when the husband was in full health.

Today, the combined total weekly income of the 43 families is \$570.61, an average per family of \$13.27. This income is obtained from the following sources:

\$111.00, 19%,	is earned by the mothers including the free rent of janitress service in 7 families and money received from 12 boarders or lodgers in 9 families (9 of the 12 lodgers being relatives).
54.50, 9%,	is earned by the children of working age.
17.25, 3%,	is given by church and church societies.
17.75, 3%,	is given by other agencies interested in families.
6.00, 1%,	is given by relatives.
364.11, 65%,	is supplied in weekly payments by the A. I. C. P. (The largest pension is \$14.25 a week to a mother with six children; the smallest, \$2.50; average \$34.00 per month.)

\$570.61, 100%

As a method of pensioning, the general rule of the association is not to pension definitely until a family has been known to the Family Welfare Department for a period of 6 months. Assistance is given in other ways, however, during the interim. The pension decision having been reached, a budget is made of the family needs,—food expense planned by a trained dietitian, and other needs, such as rent, clothing, etc., usually determined by the visitor in consultation with the mother. The other sources of income are ascertained, effort being made to secure co-operation from relatives, churches or other agencies interested in the family. The difference between such combined sources of income and the need of the family is then supplied by the association. The pension amount is always paid in weekly instalments, a visit being made to the home for such purpose.

The standard or diet required for normal conditions as determined by Atwater demands an allowance for season, age, sex, growth and occupation. This requirement has been studied by our dietitians also in relation to home

conditions, experience of other workers and the changing cost of living.

Atwater uses the working man as his unit in fixing the necessary amount of food. The association, following his lead, adopts the working man as its unit of cost, as do many other workers in similar fields.

The allowance for food according to the dietitian's schedule, is \$0.27 for the man, \$0.26 for the mother and each child over 14, \$0.08 for the children under two years. Where tuberculosis or other pathological conditions exist, the necessity of increased feeding is usually made by an increased allowance. But this is, we believe, the lowest sum at which a theoretically adequate diet may be fixed.

Dietaries are made practically adequate by the ability of the dietitian in adapting them to the conditions of each family, through practical instruction given the women in their homes concerning the care and cooking of food, and in the prevention of waste.

Allowances

The question of rent is usually one of facing actual conditions. When the visitor reports that the family is in fairly satisfactory quarters, the rent is taken as it stands. Otherwise the budget provides for any additional rent involved in moving the family to better quarters.

Experience fixes the items of fuel and light at \$2 per month for summer, \$3 for autumn and \$4 to \$5 for winter.

The allowance made for clothing is \$2 per month for older members of a family, with a decreasing proportion for the others.

In sundries there is the same difficulty as in clothing—a lack of standards. The size of the family and individuality of each member must be considered. An allowance of from \$2 to \$3 per month is now made as the "irreducible minimum."

Although inclined to discourage the insuring of children under our present expensive methods of industrial insurance, the association generally continues to pay insurance already taken out in these families, because no satisfactory substitute has yet been provided. This

TWO OF THE ASSOCIATION'S BUDGET FORMS

Where the A. I. C. P. supplies the entire income

Mother and 6 children, oldest 13 years of age, youngest 2 years; 1 boy in sanatorium.

FAMILY BUDGET

Do Widows' Pensions Pay? Three Answers

I.

"I am very thankful for what has been done for my family and myself in keeping our Home together. I tried after my Husband died to go to work every day and make a living for us which I found was very hard to do and at same time try to take care of my Home and Children. My health broke down. I was unable to work. Then the awful thought came before me of having to break up our home and put my Children in an Institution. Miss — who at that time was my visitor made plans for me that made me feel very happy both for my Children's sake and my own. My boys are not strong boys and need a mother's care what they cannot give them in an Institution. I hope I will live to see the time my boys will be able to thank you and show their appreciation of the good that has been done for us, in keeping our little Home together.

Yours Very Sincerely,"

II.

"I read your letter over and over for it gave me such a pleasure to think of someone thinking of our welfare in your standing. We are all well and happy and living nicely for ones of our mean's, my children has grown so lately and does many a little thing for me. I am very proud of them but every mother feels the same towards her children. I would have no home but for you, its you & all of you have kept me. The visitor's I cannot find words for them for my gratitude towards them not only what they gave me but gave me such an idea to live they have helped me in every ways it always made me feel good when they came to see me the taught me lots of things that I would never know of I wonder many and many a time if ever I will be able to show my appreciation towards them I speak to my children many a time about them I hope my little girl will be something like them some day.

Yours Most Respectfully,"

III.

"I am proud to think that you are taking great interest in my Dear Children & myself. Your Assistance of 10\$ weekly has certainly made an improvement with us every way, for we have plenty to eat and lots of milk to drink, and clothing for children, their appetite is increasing are fat and stronger, health is better. I have not the drag as I had nor worry, as I have more time for home what I did not have to attend to their clothing and mending keep them clean also the home I have it cosy and comfortable & we are all well and happy at present. I think if you had not come to my assistance I would have been in my grave by this and I think if other mothers goes by your instructions they also will find improvement in their homes as I have done and I thank Miss — and Miss — for instructing me how to cook and lay my money out.

I remain yours Sincerely,"

is one of the problems of relief concerning which there is much difference of opinion.

Ability to spend a stated income wisely is not uniform among these mothers to any greater degree, perhaps, than among other circles. Some will plan wisely, buy advantageously, cook well; others will not. Malnutrition resulting from too frequent buying from a delicatessen store or push-cart or from poor cooking, may be quite as evil in its results as that which comes from under-feeding.

Ignorance, it may be, which gives a sufficient quantity of food but not of the kind which has body-building and health-keeping value; love, it may be, yet love without knowledge, that feeds children on buns, pickles and coffee; carelessness sometimes, which allows dirt to accumulate and food to become unfit for use. Again, it is quite conceivable that some mothers might be tempted to cut down the amount allowed for food for the sake of spending more on dress or amusements. To guard against these possible situations, the dietitian often visits the home to make suggestions as to buying, to give detailed lessons in cooking if desired. Sewing teachers are also used to give instruction to the mothers and to older girls of the families. The object of all this personal work whether it be done by relief visitor, nurse or dietitian, is the building up of self-reliance, creating stability in the family life, giving people knowledge that shall bring with it power and responsibility

for planning and shaping their own lives.

Finally, before leaving this question of the budget, we wish to emphasize that in every case the personal factor must be more or less considered.

Some families found it possible before the father's death to live on a slightly smaller expenditure than that which we estimated. Whether the result meant under-feeding in that family, can be determined only by exact knowledge of physical conditions. This knowledge would also determine the advisability of increasing the relief in such families. On the other hand, some families, accustomed to a slightly larger income, could make the readjustment only after they had received much education. The allowance made for meeting a deficit of income in such families must be based upon the most complete and accurate data possible.

Results

In answering the question, "What results show in families where the program just outlined has been followed?" we have depended not only on a study of case records, valuable as these are; we have drawn our conviction as to the progress which these families have made, the promise and hope resident in them, from more vital sources. We offer the careful conclusions of visitors who have been dealing at first hand with all these people, who in daily contact have come to know every member of every family, who by friendliness and companionship have won their way into

the lives of "their people". From nurses who have toiled unsparingly to restore health and courage to mothers and to secure disease-resisting bodies for little children; and from dietitians who have instructed the mothers in buying, caring for and preparing food.

The conviction of these experienced workers is that there has been a decided and practical trend upward, that these families have made progress—physical; mental and moral; that money invested in them is returning interest in lives made stronger, ambition kindled, courage renewed, outlook broadened; that this adequate relief, plus personal interest and ministrations, means to the children an opportunity they are not failing to improve,—the opportunity to grow into healthy, honest, capable manhood, and into gentle, intelligent, healthy, homemaking womanhood.

There is yet a third source of reliable information about the results of our pension policy. From the mothers themselves there come to us almost daily messages and letters telling us what this help and friendship has meant to them and to their children—stories of the resurrection of hope, courage and joy of living in lives once bare and monotonous from constant anxiety, hardship and struggle; stories that tell of families released from a deadening poverty of life and environment and given at least a fair chance to throw off the shackles and to fight their way out of the blight into the light. From our mail of the last few days we take the messages given at the top of this page.

BUT there is another picture.

On February 1, 1914, the association had under its care 659 widows. Of this number 185 were childless and many aged; they are not included in this study. Of the remaining 474, 43 are—as just shown—pensioned. What of the remaining 431?

In the personnel of this group 17 nationalities are represented—chiefly Italy, Germany, Ireland and the United States. Their average age at the husband's death was 35. In occupation and wages there is but little variation—office cleaning, washing for the majority, laundry work for those physically hardy. Many of the women who follow these more strenuous and regular occupations lose their positions periodically because of sickness or home cares.

A few other women meet all or part of their rent by janitress service. In all, 192, or 44%, work away from home. It will be recalled that of the 43 pensioned mothers, only 7, or 17%, worked away from home.

In this group are 1,572 children, an average of 3.6 per family. Of these 200 are girls over 14; 194 boys over 14. The tendency is to get these children to work as soon as school grade permits. This is not because parents and visitors are indifferent to education, but because the children must supplement the family income as early as possible. Of the boys over 15 years, 131 earn an average of \$5.68 each per week. Of the girls over 14, 106 earn an average of \$5-\$8 each per week.

Twenty-four children from 20 families are in reformatory institutions because of truancy and waywardness. The explanation of this given by our visitors is "inability of the mothers to control their children."

Medical and nursing service has been given to children of 347 families. Twenty children are at present in institutions for restoring health. Our experience with children of the pensioned group leads us to believe that in the large number of cases the lesser ailments that keep these mothers in attendance upon clinics and dispensaries are traceable to insufficiency and uncertainty of income.

Many of the families are living in more or less congested quarters and un-

III. The Non-Pensioned Group

der conditions that smack not of cleanliness of living. Lack of better accommodations at a reasonable price in the neighborhood where they prefer to live by reason of strong local ties, as also from the natural desire to be near their work that both time and carfare may be saved in going back and forth—this makes improvement in this respect most difficult. Further, janitress service, which means free rent, is for many of these women the surest source of income; but apartments given for that purpose are often in the least desirable part of the building. 34 of the 431 families are fortunate enough to have bathrooms in their dwellings; 327 have access only to hall toilets. The average rent paid per family is approximately \$12.

Family Earnings

The average weekly income per family in this group was, before the father's illness, \$14.16. Some men earned only \$6 a week or less; some earned \$18 and over, but the low wages of the majority may well be given as one reason why the families became more or less dependent, for insufficient income means insufficient food, shelter and clothing, and hence exposure to the diseases that prey on under-fed, poorly clothed, and badly housed people. Of these diseases, tuberculosis took the lives of 173 (40%) of the fathers; pneumonia, 44 (10%); heart-disease, 34 (8%); industrial accidents, 23 (5%); Bright's disease, 22 (5%). Long illness of the father meant in many cases not only stress and strain and the down-dragging pull of poverty before his death, but also using up of savings that in a few cases had been accumulated. As a result, the mother passed into widowhood and the children into half orphanhood with bodies under-vitalized, energy

sapped and mind and hearts at low ebb.

That disease found progress easier in some instances by reason of intemperate habits is true. A drink at morning, noon and night seemed the easy and quick way to cut fatigue and give stimulus for the day's work. But the story of many of these men show them fighting on bravely to the last until tired, diseased bodies refused longer to be coerced; the mother meanwhile supplementing by her work the lessened income, and the relief agencies stepping in when the family fell at last below the self-sustaining line.

In many instances some time elapsed between the date of the husband's death and that on which the families applied or were referred to us for assistance. The explanation of this is found in the fact that insurance had been carried by many of the men. But where insurance was less than \$200, it was consumed at once by funeral expenses and debts contracted during the illness. Death benefits from lodges, contributions by employers and fellow employees were received in some cases. Sick benefits were received in only 33 of the entire 431 families. We cannot discuss here the bearing of these figures on the need for some form of social insurance which shall meet the contingencies that sickness brings to the wage-earning part of the community. Of the 23 industrial accident cases, damages were received in 13; 5 suits are still pending.

A careful study of the monthly budgets of these 431 families compared with those of the 43 pensioned families showed that the additional amount that would be necessary for the 431 families to maintain the standard of living set for our pensioned families would be \$6,062.87 per month. In some families the income is equal to or in excess of the necessary expenditures. In others, the income is considerably below the amount necessary to maintain the standard made possible to the 43 pensioned families.

So much for a brief review of the present circumstances of these 431 families. The question arises, Should an effort be made to treat all our widows' families on the basis on which we treat the 43? Should all these families ultimately be pensioned?

IV. Our Program for the Future

WE are not ready to say that all of these families should be so treated at once. Many of them, we believe, should. We are well aware that adequacy of treatment cannot be wholly measured in figures of dollars and cents; that sufficiency of income in one family may simply mean that the mother or the children are working when they should be at home or in school; or again, that

insufficiency of income may mean that some individuals in the family are not doing all that they should. Again, it may well be that some few of these homes are of a character that would make any effort unwise to keep them intact. Poor as institutions may be as

substitutes for family life, there is no question that they are better than occasional homes with which we have acquaintance.

Yet in making decision as to what family shall be accorded aid in the form of a pension and what family shall not, we must not attempt that impossible thing—drawing an arbitrary line between a fit and an unfit mother. In

a few cases the facts will be palpably plain. In many others quite the opposite will be true, and any early attempt to judge too finely between deserving and undeserving, worthy and unworthy, promising and unpromising, will tend as always, to make the administration of such relief unequal, if not degrading.

Friendship won by continuous service,—that alone can determine merit. From the ordeal of the average relief application office, where they must be grouped and counted among general applicants for relief, these mothers and children may well be spared. Self-fault, improvidence and imposition on their part should not be assumed. The most precious asset to be preserved is independence, self-respect, the finer fibre of those subjected to stress and strain. We play fast and loose with these qualities, especially when dealing with children, when by any system of relief giving we make it necessary for them to appeal constantly to individuals or to institutions for aid.

Uniformity

Again, it is highly important, in our opinion, that similar needs in different families should be met with some approach to consistency, that there should be a degree of uniformity as to methods and standards of treatment. Without such a controlling principle there is bound to come unfair discrimination; a provoking of a sense of injustice; a feeling of bitterness and resentment towards a policy of relief which gives to one family what, for no apparent, understandable reason, it refuses to another.

Certain conditions to be met by those desiring aid must, of course, be made; but these should be of a nature easily understood by all—a statistical statement establishing beyond question the fact of widowhood, the number and ages of the children, the resources and needs of the family. At the same time it must be made plain to the mother under what conditions the aid is given and what will be required of her to assure its continuance.

We believe that a fairly high standard of character and home care should be expected from the mother; that continuous and adequate relief should be used as a lever, if necessary, to lift and keep families to a reasonable standard in such matters as care of health, regular attendance upon school, and general conduct. But it is utterly unfair to demand these things until we have supplied the means that make them possible, just as unfair as it would be for a public school system to demand that parents send their children to school without providing the school buildings to which they might send them.

We do not mean to say that work of inspection will not later on be neces-

sary from time to time. It should deal with the health of the children, their progress in school, and the general condition of the home. Women of high grade and of rare tact and sympathy are required for such work. The delicate needs of these families cannot be met by clumsy, untrained minds and hands. Rather do they call for that which only people of fine spirit and fine mind can give. The influence by which the weak are inspired and strengthened to overcome temptation, the setting up of ideals which shall enlarge the outlook on life, the giving which carries with it the personal interest and service of the giver—this is the charity that overcomes poverty.

It is quite likely that such subsequent investigation will show some mistakes made. Better that risk than the larger one of compelling all to live through a period of minute and trying investigation, of wearing anxiety, of possible want at a time when they are least able to bear it. I have no doubt that there will arise occasion when there will be need of rigid interference with the wishes of the parent. The safety of the whole community may, at times, plainly require the removal to an institution, the placing under custodial or probationary care, of this or that member of the family distinctly unsound or unfit in mind or body. A relief program must not only be comprehensive and just; it must also be educational and, if necessary, disciplinary.

Vision and Action

This then should be our program: Nothing less than the treatment of all our widows' families on the same basis on which we are treating the 43 which we have described.

Believe as we may and do in the necessity of accident prevention laws that shall protect the living and thus reduce the number of widows and dependent children; in workmen's compensation and employers' liability laws so that industry shall bear the expense of maimed, mangled and worn out workers; in the working out of a comprehensive plan of social insurance that shall make adequate provision against all insurable risks, such as sickness, death and old age—yet we cannot let possible future solutions blind our eyes to present conditions that call for immediate relief, to the plain fact that in a large number of families today, in spite of all the work we and others are doing, the health of both mother and children is impaired and deterioration rather than rehabilitation is taking place.

Visions and prophecies of a day when, by large preventive social measures, the causes of want and destitution shall be cut away, must not prevent us from taking immediate steps towards remedying some of the worst conditions that have

fallen upon these women and children. These but follow our failure in the past to check and to prevent the growth of adverse social and industrial conditions which are in large part responsible for the stress, the strain, and the want, that now cruelly grip their lives.

A New Budget

How much money do the facts which this inquiry discloses indicate would be necessary for this association to expend for the accomplishment of such purpose? According to records, it would have required an expenditure of approximately \$6,062.87 more in the month of January than was actually expended. For twelve months this would mean \$72,754.44. It would seem, then, that an increase in the budget of at least \$72,754.44 would be needed for material relief for the next fiscal year for widows' families alone, and this without taking account of any possible increase in the number that may come into our care.

But further, this standard of relief which we would apply to widows' cases should also be applied to certain other classes of cases, such as families in which the breadwinner is totally incapacitated for work either temporarily or permanently by chronic sickness or insanity.

Our experience with the many families in our care in which chronic sickness in one form or another exists, leads us to believe that the necessary raising of the standard in this group would require an additional annual expenditure of approximately \$20,000.00. This, added to the amount necessary for widows' cases, makes a total of \$92,754.44.
